A friend to improvement, his remarks 307
Agricola on geological surveys 322
Agricultural Society at Sunbury, notice of their proceedings and premiums 27
— of Hillsborough, N.H. their cattle show 78—
— officers of 95
— of Essex, their arrangements 83—notice of their cattle show 93—their premium for potatoes 98—their reports, 201
— of Middlesex, their arrangements 84—their cattle show 101
— of Massachusetts, rules and regulations, 86—their cattle show 102—toasts drunk at 110—their premiums 233—their reports No. i, 107—No. ii, 110—Nos. iii and iv, 113—No. v, vi, a, d, vii, 114—No. viii, 129—on agricultural experiments 302—premiums offered by, for 1828, 236—choice of officers 406
— of Rhode Island 93—premiums offered by &c. for 1828, 330
— of Hartford, Con. their cattle show 90—viewing committee of, their reports 90—do. on ploughing 104—on domestic animals 104
— of Worcester, their cattle show 98
— of Ontario, their cattle show 117
— of Merrimac County 117, 147, 361
— of Stockbridge 125
— of New Brunswick 125, 133, 235
— of Bristol, Mass. 133
— of Cheshire, N. H. 150
— of Windsor, Conn. 162
— of Jefferson County, N. Y. 164
— of Philadelphia 217
— operations in England, great extent of 153
— in France, notice of 62
— in Indiana, sketches of, by S. Hornbrook 97
— in Corsica 100—the British colonies 118—remarks on, from the N. Y. Statesman 178—in Georgia 198—in Flanders 234
— and geological surveys, proposed by Mr. Holbrook 387
— Societies, benefits arising therefrom 346
Ague, cure for 52
Air-bed, notice of 991
Air-plant, notice of 320
Alleo, Rev. M. expenses and income of his farm 161
Alligators, notices of 304
Almanac, British, notice of 893
Althea, frutex 347
American aloë, notice of 254
Ants, remedies against 11, 67
Apples, Siberian bitter sweet, notice of 76—large ones 95—preserved in flax seed chaff 127—part sweet and part sour 160—how marked with impressions of a leaf 203—preserved in grain 293—worms in 246
Applesyrup, how made 81
Apple trees, a disease in, Mr. Lowell's remarks on 17—how cultivated as dwarf standards 260—a remarkable one, which blossomed and bore fruit three times

in one season 294—pear trees, extracts from Knight's treatise on 369, 381, 385, 404—Mr. Preston's remarks on 377—on placing pomace round for manure, 366
Arracacha, growing in England 203
Arrow-root, potatoes not a good substitute for, 159
Ashes, wood, as a manure 231
Atherstone, J. on the cultivation and uses of woad 54
Australian Agricultural Society 180
Bacon, hams and tongues, on preserving 66
Bag-worms, how destroyed 275
Barley, hulled by Mr. Stevens 231
Barometer, infallible 40
Balm-tea, promotes health and longevity 372
B. C. his remarks on blight in pear trees 1
Beans, directions for harvesting 53—lima, notices of 325—how cultivated 326
Beck's essay 293—by Mr. Lawrence, Jaffrey, N. H. 293
Beer, hop, receipt for making 349, 362—spruce 372
Bee hives in forests, notice of 81—new construction of 333—successfully buried in the ground 337—placed in winter where the sun never appears 391—should be placed some distance from the ground 11—observations on, by "Medicus" 153, 177—sagacity of 192 watching the time of their swarming 170—practical hints on management of 193, 254, 262, 289, 290, 361, how to protect from the bee-moth 321
Beet, green, a substitute for spinach 75—sugar, its cultivation 254, 268, 285—on making sugar from 313
Beets, on the cultivation of, by Wm. Carr 302
Beetles, (insects) notices of 373—how destroyed 399
Bells, hung near the ground can be heard further 11
Benton, W. H. his notice of the spontaneous growth of silk in Mississippi 338
Birds of the Mississippi valley 258—that destroy insects, notice of 289
Birds' nests, edible, remarks on 153
Black currant wine, how managed 130
Blackstone canal, notice of 149
Bleaching, by steam, remarks on 291
Bleeding at the nose, remedy for 334
Blight in pear trees, remarks on by B. C. 1
Blood, successful transfusion of 139
Blood-hound for detection of sheep stealers, &c. 339
Bone, on the strength of 101—use of as a manure 254
Bonnet, honey of, remarks on 163
Bok farming, remarks on 364
Borage, notice of 329
Boring for water 149
Bois, killed by a decoction of white oak bark 149—remarks on, by Rev. L. Capen 257
Brakes, on gathering for manure, &c. 53
Bread, brown, recommended in dyspepsia 43—remarks on making 6—from turnips, receipt for 372—how made from potatoes 373
Breeds of domestic animals, remarks on 174
Bremen geese, by Col. Jaques, notice of 174
Brewer, London, notice of 37
Brewster, G. his mechanical ingenuity rewarded 91
Broccoli, directions for cultivating 249
Brussels sprouts, their culture and uses 299
Budding fruit trees, how performed 21
Buel, J. Esq. on Legerhorn hats 103—on Lucerne 109—on disease in pear trees 109—on improving the kinds of pear 115—on Lucerne 179—on horn pits for manure 241—on improvement of pastures 308—notice of his nursery grounds 367
Bueta abaxo, a new kind of tobacco 315
Buffum, Arnold, recommends mulberry hedges 30
Bugs on vines, how destroyed 255
Buildings, flimsy erecting of, censured 26, 45, 209—on stone recommended 269
Bull Bolivar, notice of 350—his pedigree 363
Burns and scalds, remedy for 165
Buttans American, manufactory of, at Attleborough 161
Butter, how made in cold weather 157—method of salting 302, 358—to keep from growing rancid 302—on the manufacture of, by S. De Witt 316, 324, 332—remarks on making 333, 354—premiums for best specimens of, offered by N. Y. City Agri. Society 339—Mr. Peters' remarks on making 370—on making, by a lover of good butter 370—a premium of \$100 offered

for best, by citizens in Boston 387—large quantity made from one cow in a week 389
Cabbages, modes of preserving 70, 203—a large one 155
Cabbage, turnip, its cultivation recommended 269
Calf, large, notice of 163, 163, 293, 354
Calves, on raising 354
Camellias, how raised in the open ground, 337
Canada thistle, how destroyed 30, 362
Canadian, or tree onion 11
Canals in New York and in China 2
Candleberry myrtle, remarks on 274
Canker, to preserve apple trees from 75—in fruit trees, how remedied 251
Cank-r-worms, remarks on, and remedies against 157, 153, 169, 310.
Canning, Mr. notices of his death 62
Canvass, American, notice of 47
Capen, L. his remarks on botts in horses 257
Carrots, betts and parsnips, on their cultivation 302—advantage of, in fattening oxen, &c. 265
Cardoon, varieties of, and manner of cultivating 160
Carter, N. H. Esq. extracts from his address to the N. Y. Horticultural Society 196
Casks, tainted, how remedied sweet 372
Cast-iron, chilled, its use for punches, &c. 185
Caster bean, cultivation of, recommended 294
Catalpa tree, description of 35
Caterpillars, how destroyed 329, 337
Cattle and sheep in pastures, seven to once a day 14—Col. Jaques' feed for 14—remarks on, by Mr. Marshall 35—remedies for, when botten or swollen 61, 334—improving the breed of 109—notices of large, owned by Capt. Benj. Howard 161—remarks on feeding and managing 168—not salted in winter 166—notice of a print of 183—feeding and fattening 206, 214—choked with roots, &c. how relieved 213, 227
Horn distemper in 243—weight of in London in 1700, short horns, breed of, pedigree of 321
Cauliflowers, on obtaining an early crop of 268—on their culture 329
Celery, on its cultivation 251, 337
Cement, Roman, remarks on 154—water, lime-stone for, found in Southington, Con. 288—likewise in West Springfield 229—used for boilers, how made 275
Chambers' medicine, analysed, &c. 197
Chaudier, David, his mode of protecting bees from the bee-moth 322
Charcoal, danger from burning 283
Chaumont, Le Ray, Mr. his remarks on the vine 161
Chemistry, applied to agriculture 186
Ches-nuts, French, large size of 152
Cherries, on making 356—not colored, premium offered for 257
Ches-nut tree, wood and bark of, employed in dyeing and tanning 119
Chimney swallows, notice of 273, 240
Children, on the Gales of 123—management of 170
China tree, notice of 130
China tree, its use in taking spot from dresses 249
Cholera, Morbus, how produced 27—burnt cork recommended for 59
Chrysanthum, much cultivated in England 337
Cider, directions for making 84, 100—how purified when musty 350—on the process of fining or purifying 385—how made by the Shakers 404
Climate, remarks on its changes 285
Cloth, cause of the hilling of 57
Clover, second crop of, profitably mixed with straw 51
Coal, Worcester, notice of 162—as a manure, experiments on 275—found near Hartford, Con. 389—in Pennsylvania 405
Cobbett, Mr. his remarks on flowers and ornamental gardening 234, 245, 253, 261, 269—his nursery 269
Cochinal, its cultivation in the Southern States recommended 296
Cockroaches, how destroyed 5
Codfish, how cooked 11
Codfishery, Newfoundland, notice of 27
Coffee, notice of 237, 241
Coffee tree, how preserved ready made 40—Siberian, 348—remarks on 370—Arabian, method of preparing 395

- Coffin, Gen. his presents to the Mass. Agri. Society, for which he received the thanks of said Soc. 163, 151—notice of his present of horses 323, 364
- Composts, remarks on, how made, &c. 365
- Consumption, cured by riding 197
- Copperas works at Stratford, notice of 92
- Cornish mines, notice of 29
- Cottage, an English, remarks on 405
- Cow, an extraordinary one 7—an other, do. 10—large ones 216, 279—choked, how relieved 213—profitable owned by Col. Fowl 363
- Cows, fed on fish 146—on the management of 166, 358—remedy for swollen bags in 249—with a large calf 354—profitable owned by Rev. Mr. Phenix 363
- Cow tree, description of 35
- Cradles for infants, condemned 256
- Cranberry, high, may be cultivated in gardens 267
- Craunton, Mr. his remarks on disease in pear trees 96
- Crops in Nova Scotia, notice of 5 53, 129—in Berkshire county 10—large, of wheat and rye 53—of Indian corn, &c. 149—importance of thinning 350
- Cruelty to animals 207
- Cuculla, a remarkable kind of fire-fly 93
- Cucumbers, how preserved for pickles 81, 351—one weighing nearly 5 lbs. 95—how raised in winter 150 on raising early 246—planted in a torpid 247—how raised in Russia 285—garkin, how raised 325—how raised more wholesome 350
- Cultivator, his translation of a French treatise on the cultivation of the vine 53, 109
- Curr, William, on the cultivation of carrots, beets, and parsnips 302
- Currant jelly, how made 6
- Currants, on their culture 229
- Cuthers, in w to propagate from 250
- Dahlia, numerous varieties of, exhibited in London 37—cultivation of, recommended 372
- Danvers in Devonshire, England, their management 307
- Dai y directions concerning 130, 258—profitable, of Mr Dyer 181—of Mr Woodruff 212—of Mr Denny 239
- Dairy secret 11
- Damp destroyer 357
- Damp walls, how dried 155
- Dandelion, on its cultivation, by Gen. Dearborn 337—by the Editor 342
- Davis, C. Esq. his replies to queries on orchards 122
- D. C. on destroying worms in peach trees 345
- Dearborn's platform balances, notice of 133
- Derby, E. H. Esq. his mode of making butter 157—his account of the pedigree of the improved Durham short horn stock 331
- De Witt, Jacob, on destroying insects 336
- Duck, how destroyed 73—uses of 251
- Dozs used as beasts of burden 167—for sawing timber for shales, &c. 293
- Domestic life 56
- Doonick, Hon. Mark, extracts from his address 156
- Drainage, remarks on, by H. W. D. 361
- Dress of children, remarks on 52
- Dressing soils, remarks on 111
- Drilling crops, remarks on 73
- Dropsy, cure for 512
- Drought in Georgia 20—in Tennessee 27
- Brown, Dr. S. on planting trees 301
- Drunkard's mirror 162
- Drunkardness, its causes and preventives 390
- Dung-hills, insubidity of 120
- Dysentery, cure for 24
- Dyspepsia, remarks on, and remedies for 525, 376
- Father, Amos, his remarks on the effects of light on trees, &c. 238
- Egg plant, remarks on 315, 319
- Eggs, on preserving 6, 152
- Elderberry wine, how made 99
- Ely, J. M. on lucerne 179
- Elia, Boston, notices of a painting of 217, 354
- Elwyn, John L. his remarks on horses 153, 257, 273, 281, 301, 351
- Enslaves, notices of 320
- Empyria, cure for 77
- E. S. F. his remarks on a singular disease in sheep 154
- Ewes and lambs, on the management of 217
- Esque plants, how naturalized 120—utility of introducing 130
- Expansion of solids by heat 160
- Farm, a profitable 171—perfectly cultivated a great productive power of 220—on C. H. B. large extent of 233
- Farms, small, advantages of 371
- Farmer, a, on the uses of apple pomace 132, 154—on wood ashes, &c. as manure 231—the employment of writing evenings 241—his remedy for poisoned sheep 265—on a wash for fruit trees 266—on the management of bees 290—notice of the state of the season 331—a poor, signs of 355
- Farmers, in New England, notices of by an Englishman 233
- Farming, British, causes of its superiority 86—in Alabama, 124—remarks on, from the Western Monthly Review 125—remarks on, in Berkshire 125—may be made a profitable business 161
- Female education 350
- Females in France, employed in fields, &c. 267
- F. H. P. remarks on fish ponds, animal manures 136
- Fences, posts for, top part placed in the ground 962
- Fennel, on its culture 339
- Fish, on the propagation of 10 181—on the transportation of, from salt to fresh water 34, 369—tainted, how restored 70
- Fish ponds, remarks on 40, 156
- Fiske, Hon. O. his remarks on suckers in fruit trees 50 on a disease in fruit trees 266
- Flannel of American manufacture, notices of 131
- Flax, water rotting of 259—machine for breaking, premium offered for, by Pennsylvania legislature 274
- Flint's Western Review, extracts from, 92, 254
- Florida, middle, notice of 100
- Flowers, decayed, rendered fresh by hot water 26—method of preserving 71—extracts from Dr. Greco's treatise on 343
- Floy Michael, his notices of New Zealand spinage 116 on a new kind of peach 213
- Food of the French 203
- Foreign plants and seeds, on introducing them into the United States 145

HORTICULTURE.

BLIGHT IN PEAR TREES.

We publish the following with pleasure; and entertain a hope, accompanied with scarcely a shadow of doubt, that our respected correspondent has ascertained the cause and pointed out a remedy for one of the most serious evils which the orchardist has to encounter.

Mr FESSENDEN.—The cause of the blight on pear trees has frequently been a subject of inquiry; but as yet I believe nothing has been satisfactorily determined. This disease is quite common in the neighbourhood of Boston, as I learn from gentlemen residing in the vicinity, as well as from the speculations which have appeared in the *New England Farmer*, by some of our most scientific horticulturists. This disease is well known to affect the pear orchards in the vicinity of New York, Philadelphia, and also in the neighborhood of the great cities in England.

It most commonly attacks trees standing in well cultivated and rich soils. In this, I apprehend, lies the first cause of the disease. I have found from the observations I have made during the last four years, that every tree which bore large quantities of fruit was more or less blighted; while other trees of the same kind of fruit, of the same age, and standing in the same ground, but moderate bearers, were not affected by this disease. Last year I observed that a tree of the pound pear kind had one of its largest branches so completely fixed with fruit, that three props were placed under it to prevent its breaking down. A few days since I examined this tree, and found that identical branch blighted. The leaves appeared to have been burnt, and the bark was decayed and dried up, presenting the usual appearance of blighted trees. I examined another tree in the same orchard, having a single branch blighted, which last year was overloaded with fruit. The other branches were in a vigorous state.

I was led to conjecture the cause of this disease, from observing the effects of overbearing on a single branch of a Baldwin apple tree. This branch was so completely filled with fruit, that the apples touched each other from the insertion of the branch to its extremity. I tied it up to the other branches of the tree, and it ripened all its fruit. The next spring it put forth its leaves, and flourished till the middle of July, when it was suddenly blighted,—the branch presenting the appearance of having been burnt. This year it is dead.

The reason, I conceive, why pear trees are more subject to blight in a well cultivated and rich soil, is, that they are forced to a higher state of vigour than trees standing on a poor soil or in grass land. After a year or two of rich culture, they become exceedingly vigorous, make a great proportion of wood, and form numerous fruit spurs; and then, a favourable year occurring, they are overloaded with fruit. The maturity of this great quantity of fruit checks the growth of the tree, exhausts it, and destroys the vegetative principle. It is well known that an apple tree decorticated in the winter will put forth its leaves and blossoms in the succeeding spring, and even bring its fruit to ma-

turity; but by this time it is exhausted, and at this stage of the process, the whole dies. The overbearing of a pear tree seems to exhaust the vegetative principle in ripening its great burthen, yet it may throw out its leaves in the succeeding spring, and continue to flourish till the time the sap ceases to flow in summer, and then die. If overbearing be the cause of the fire blight, the obvious preventive is, to thin off the fruit wherever it shall appear to be too much for the tree to bear; and this will depend upon the vigor of the tree, the richness of the soil, and upon other circumstances, of which the horticulturist must judge. The overbearing of the peach tree and grape vine is equally fatal to them, as to apple trees.

Upon stating my conjecture to Mr McGuire, the head gardener of ELIAS H. DEXBY, Esq. of Salem, I was happy to find it corroborated by his own observations in a great number of instances, and he declared to me his perfect conviction that this was the cause of the disease. That Nature, when "let alone," will "regulate herself," is true; but she will not regulate herself according to the purposes of man. It is necessary in horticultural as in political economy, to apply the restrictive system, in order to produce the best results. B. C.

Salem, July 24, 1827.

STRAWBERRIES.

It is stated in the *Gardener's Magazine*, that John Williams of Pitmaston, near Worcester, cultivates strawberries on small ridges of earth running north and south, about nine inches above the level of the ground, planting the strawberries on the top, and laying plain tiles on each side of the ridge. He finds the produce earlier, more abundant, and better flavored, than on plants grown on the flat ground. The flat tiles retain the moisture, promote the ripening of the fruit, and keep it free from dirt after heavy showers of rain.

WHITE MULBERRY.

It is suggested in the *American Farmer* that it would be well if Editors of papers throughout the country would suggest the expediency of gathering white mulberries, wherever they are to be had, and drying them for the sake of their seed. He who thus lays a foundation for a nursery of young mulberry trees will not fail to find an adequate demand for them.

SHELTERING TREES.

Nothing is more common than to select for the reception of a delicate tree in the open air, a warm south border, fully exposed to the daily influence of the sun; it being believed that the chief difficulty in preserving what are called half hardy trees, arises from a deficiency of solar heat. This is a mistake. Solar heat is more frequently injurious than advantageous to such plants; it dries the circumambient atmosphere to a degree which cannot fail to prove highly prejudicial to most arborescent plants. The best station which can be pointed out for a tree which is to be acclimated, is in a sheltered garden, where it is well protected from the north and easterly winds. It should face the north-west, and be so much shaded from the sun, that during the warm days of spring, it

may not be excited into early vegetation. In such a spot the Mountain Peony, Scarlet Nipal Rhododendron, and similar plants, survived the last winter; while in most places, differently situated they have been wholly destroyed.

THE SEASON.

We do not remember to have ever seen so many favourable notices of the products and the prospects of the season, as at the present time. The papers from Maine to Georgia are teeming with the *fruitful* theme, and grass and grain, pumpkins and potatoes, corn, cotton and cabbages, are declared from all quarters, as with one voice, to have been "never more prosperous." In our own neighborhood, the *Lynn* paper declares that the season, thus far, has been most precious. Hay-time is nearly over, with farmers in this neighborhood; and the abundance which has crowned their labors, is such as demands our liveliest gratitude to the Author of all Blessings. So great crops of hay have not been known for many years. Some of the farmers have cut from two to three tons per acre. We have been visited with copious showers and sunshine, and the early and latter rain have come in their season. Fruit is not expected to be very plenty; but the luxuriant fields of corn look beautiful, and promise a rich harvest. [Salem Gaz.]

AMERICAN INGENUITY.

Mr Jacob Perkins has been engaged by the French Government to build steam artillery. A piece of ordnance is to throw sixty balls of four pounds each in a minute, with the correctness of a rifle musket. A musket is to be attached to the steam generator, for discharging a stream of lead from the basin of a fort. It is to throw from one hundred to a thousand bullets in a minute, as occasion may require. A series of satisfactory experiments has taken place at Greenwich, attended by the French Engineers appointed for the purpose by the Duke d'Angouleme, with one of his aids, and Prince Polignac. Lord Wellington remarked, that a country defended by this kind of artillery, would never be invaded. Lord Exmouth, after witnessing a few showers of lead, said he believed the time would come when a steam gun boat, with two large guns in her bow, would conquer any line of battle ship; and Sir G Cockburn said, the mischief of it was, it would be to nations what the sword and pistol was to duellists—it would bring strong and weak on a level. [London news.]

SOWING GRAIN.

An English farmer, impressed with the idea, that a better rule might be obtained for sowing the various species of grain, than what could be regulated by the calendar, determined to make minutes of his own periods of sowing as they were in coincidence with the blossoms of well known trees; or on the return of various birds of passage, with the earliest voice or song of these, or such as were stationary in the country. The following is the result of his observations for a series of years:—

Peas and spring vetches.—As early as the lark arises to sing, and partridges are paired.

Oats.—When rooks begin to build, and the male blossoms (catkins) of the hazel expand and shed their farina.

Barley.—At the earliest discovery of the cuckoo, and the white-sworn buds of the blackthorn.

Cabbage and Turnip-rooted Cabbage.—At the appearance of the hyacinth (blue-bell) and when the ring-dove (wood pigeon) begins to coo.

Potatoes.—When the wilding or crab apple is in bloom; and perhaps the true period of taking them up is at the dropping of its fruit.

Turnips.—When the elder flowers, and cherries ripen.

Wheat.—At the fall of the aspen leaf, or when the grey or Royston crows return; but these being only local visitants, most of the inhabitants in several counties not being acquainted with them, their return is in correspondence with the latest fall of the acorn and the variegated appearance of the woods.

This theory of sowing has been suggested by two distinguished naturalists, viz. Dr. Stillingfleet, in his "Calendar of Flora," and Dr. Goldsmith, in his "History of Animated Nature."

From the American Farmer.

At the close of a collation in the Hall of the State-house, at Boston, on the 4th inst. a number of toasts were drunk by the Governor and other distinguished men of the state; and, amongst others, the following—

By the Sheriff of Suffolk. Our Territory—Co-existing with our agriculture and civilization:

Far be from us the undelightful pride
Of nerveless empire, cultureless and wide.
Young men, forbear o'er distant wilds to roam
In search of comfort, better found near home.
Rouse to fertility, by skillful toil,
Each dormant acre of your native soil,
And, more than riches, covet the applause
Of faithful subjects to benignant laws.
So shall your sires, withdrawing from life's race,
Joy to behold you well supply their place;
So shall your country, happier for your birth,
With strength unshaken, hold her rank on earth.
For centuries stand; and high-raising honor gain,
More from her children than her vast domain.

On the above, a friend who sent it to us remarks, "hat,—" this toast by the sheriff of Suffolk, Charles Pinckney Sumner Esq. deserves a place in the American Farmer, and ought to be conspicuously suspended in every mansion and leg cabin in the United States and territories attached to them";—and we heartily unite in the sentiment.

Instead, however of bringing up their sons to pursue this judicious course, on which the salvation of the state depends, it has been the universal practice of parents to encourage them to *flock to the towns*—there to get into the stores, and lawyers' and doctors' shops; or to send them to West Point, or in the navy; in short, any thing rather than teach them to *take the plough by the handles*, and submit with a good grace to the will of their Creator—that man shall *live by the sweat of his brow*.

When regarded with just discrimination, can there be any station in life more truly honorable than that of him who practices the utmost economy and cleanliness in clothing and diet; and who is not deterred by laziness or false pride, from wielding the axe or guiding the plough,—his mind having been first enlightened by a good solid education, and in that manner qualified to understand

the moral duties that belong to his social condition, and to appreciate the political blessings of his country?

In that portion of the United States which is most highly cultivated, where few hold large landed possessions, but where all are independent; where every comfort abounds, and gaining and drunkenness are alike unknown—every man takes his share of labour. Judges and governors, and members of Congress are not ashamed to be seen in their working frock and trowsers; and better would it be for us, were the example of the Roman general revered more in the field, and less in our cups.

Be assured, young men, to this honorable destiny you must come at last, willing or not willing. It is the irresistible tendency of our institutions to crumble up all large estates into small ones, and to bring the whole population to that condition in which fortunes must all be very moderate, and nearly equal, and in which each member of society will have to perform his portion of the manual labour necessary for the support of all. The political creed in which we have been reared inculcates equality, and inspires all with the will to divide equally; and where the few casual holders of large landed estates that yet remain in the country die intestate, the law steps in to enforce that division. A large estate may be even yet, it is true, sometimes, but rarely, accumulated by a series of commercial good luck, or by speculations acutely conducted; but of those who push their fortunes by trade, a great majority are taken by misfortune, or overwhelmed by their own extravagance; and after years of anxious adventures, find themselves at last reduced to the greatest distress—deserted by their *sunshine* friends, and without energy or means to undertake new enterprises.—In comparison with this, the lot of so many who embark upon the uncertain sea of commerce, or seek a precarious livelihood in the barbarous arena of *modern* politics—how enviable is the situation of the laboring agriculturist.

"His habit pure, with plain and temperate meals,
Robust with labour, and by custom steel'd
To every casualty of varied life."

In regard to the medical profession, there are already almost as many students as there are various drugs to be compounded; and doctors so numerous, that were every man in the nation of his back, he might be "helped to his grave" as speedily as in the days of Sangrado himself—as lancets are equally sharp and calomel is quite as potent as hot water. Lawyers are swarming like locusts o'er the land, and "dream of fees" more than they ever get; measurers of tape and calipers as thick as bees in a pot of honey. The *mill* shipmen are all over every ship, and for applications for the military academy, the only avenue to the army, there are ten thousand!!

But, say our young friends, can we not escape the odious drudgery of manual labor, by migrating with a few slaves to some new country, whose virgin soil, teeming with fertility, asks only to have the seed sprinkled on its bosom, to make returns beyond measure? No; we say again—

"Rouse to fertility, by skillful toil,
Each dormant acre of your native soil."

The products of those states in which you are allowed to carry slaves, will scarcely pay all expenses of cultivation and transportation to market; except, perhaps, sugar and rice, which are the

growth of regions and modes of culture, mortal in their effects upon the health of adult white set tlers.

To arrest at least, in a great degree, the course of deterioration under which the middle and southern states are sinking in respect to population and social comforts, a few things appear to be necessary, and these are happily within the reach of the rising generation of young men. The first is, to shake off, as inglorious and disreputable, the habits of idle *consumers*, drones in the hive; and fall to work as *industrious producers*—active bees; each gathering more honey, be it ever so little more, than he eats. Let every one firmly resolve to top off every *superfluous* expense in diet, drink, clothing, equipage, servants, and furniture, and make it a point of honour to set an example, in his *own person*, of regular industry. Your idle companions, who murder time in whiskey stores, and village card and billiard tables, may sneer for a time at your early rising, your homespun coat, your frugal meal, your rough hand, your sun-burnt cheek, your contempt of the bottle, and your abhorrence of the dice; but you will soon realize the unspeakable delight of getting, and of keeping out of debt; you will see, that by the *skillful culture* of your *native soil*, with your own hands, it makes you ample returns; that all *essential* comforts are accumulating about you; and, in every reasonable sense of the word, you have enough and to spare; and that there is no longer any occasion to fly in cowardly fear of honest labour, either to the more enervating or less manly pursuits of the town, or to half savage, half civilized frontiers. So far from regarding as discreditable your change of habit from that of loungers, too proud to lead and too lazy to drive; *anti consumer fruges*; the man of sense who sees you rise with the lark, and call out, *come boys!*—will look upon the metamorphosis, as more beautiful and worthy of admiration, than that which ensues the chrysalis state of the insect, that enters as a loathsome worm, and emerges on wings of independence that bear it to the skies, reflecting as it rises, hues more various and splendid than all the colours of the rainbow.

From Flint's Western Quarterly Review

NEW-YORK CANALS.

When the New-York Canal was undertaken, there were not wanting persons to scoff at the idea of its being a practical project. Nothing would convince these gainsayers, but the palpable demonstration of seeing and feeling. Boats of all burthens, we believe, as high as an hundred tons, move up the country to lake Champlain, and bring messages from the Nereids of the blue wave to the Naiads of the pellucid fountains, that dash amidst the dark forests of the Green Mountains.—Boats move over the rapid Mohawk, as he foams along in his deep and slaty channel below the calm and sleeping waters of an artificial river in the air. Along the whole course of this canal, large and respectable towns, with their bustle, and their massive buildings, and their city show, and numerous villages, that, twenty years ago would have been called towns, spring up, like the prophet's gourd, and seem to have been transported there by the power of enchantment. A single and isolated fact, and one far from the ordinary samples of demonstration, is sufficient to show the operation of this canal. As we looked

on the bistle on a wharf, in the harbor of New-York, we saw large, knotty, and unsightly logs, apparently of a weight to sink in the water, loading on board a large ship, bound for London.—We were told these logs were cut near the shores of Ontario. They were of the class called bird's eye maple, and were intended to make cabinet furniture for the citizens of that luxurious metropolis, who wanted a wood *less common and cutlar than mahogany*. Before the canal existed, one of them could not have been transported from Ontario to New-York for twenty times its value. It is only since the New-York canal, that the name 'Genesee flour' was known east of New-York. It is now the principal kind used.

CANALS IN CHINA.

To abridge the labor, expense and difficulty of transport was a project, naturally connected with observing the vast improvements of labor-saving machinery. That sagacious and tranquil people, the Chinese, on both the subjects have been accumulating the fruits of an hundred generations.—Canals with them are almost as ancient as their history. It is believed, that the length of all the navigable canals in that vast empire, cast into one sum, would make a total of some thousands of miles. More than a million of people constantly reside upon them. Transports and passage are performed with astonishing ease and cheapness. From these and other causes, "every road maintains its man." A very striking representation of Chinese management, in these respects, was presented in a Chinese engraving. It showed a woman, guiding rapidly along a canal, a boat of ten tons burthen. She carried a babe, appended to her back, after the fashion of our Indians. She rowed the boat with her feet, having an oar after the fashion of the country, fastened to each foot. She managed the sail with a cord attached to its triangular point with one hand. With the other she held the rudder; and thus occupied, transported a load, which, to have been carried on the land, would have required ten teams, and as many drivers to do it.

HESSIANS.

An American gentleman travelling in Europe lately visited the duchy of Hesse Cassel, that country from which thousands of soldiers were hired by the British government in 1776, to fight the liberties of America. He found the population so burdened and oppressed that it seemed "as if the last ounce only was wanting to make them sink." Hesse is an open country, destitute of enclosures, and negligently cultivated.

Mr. Russell, in his "Tour in Germany," says the Hessian peasantry are chiefly hereditary tenants, who have one way to do a thing, and never think of looking about for another. They wear low crowned hats with an immense brim, and allow their shaggy locks to grow unshorn, and to seek their tangled way down the back. Their dwellings are dark, smoky, dirty hovels. Crowds of begging children surround the traveller at every stage. The late elector left behind him 40 illegitimate children, and 40 millions of rix dollars. The foundation of his wealth was laid by his father, in hiring out his troops to England, for the American war.—*Hamp. Gazette.*

The Pottsville (Pa.) Journal notices the discovery lately of *thirty-four* new beds of coal, of from three to six feet in thickness.

From the Hampshire Gazette.

VOLCANO.

In the month of May last, three gentlemen residing in Mexico ascended to the summit of the celebrated volcano of Popocatepetl, near the city of Mexico. Of the many attempts that have been made to reach the top of this stupendous mountain, this is the only one that has succeeded.—The party left the city May 15th, and on the 19th reached the height of 12,511 feet above the level of the sea, where they passed the night. On the 20th they mounted their mules, and soon passed the bounds of all vegetation, and entered upon a region so stony and precipitous that they were obliged to abandon their mules and proceed on foot. The difficulties of the ascent increased as they advanced—there was no bush or shrub by which they might support themselves, and the stones upon which they stepped frequently rolled from under them, and went thundering down the sides of the mountain, endangering the lives of those who might happen to be below. Their Indian servants became so terrified that nothing could induce them to continue farther; they returned to the place where they had passed the preceding night. The rest of the party clambered from rock to rock, encountering many difficulties and dangers, until they suddenly discovered the object of their labors and sufferings. They had passed the day in profound solitude without seeing a plant, bird or insect in the midst of broken rocks, and horrible precipices; experiencing severe pains in the head and knees, a difficulty of breathing, and a disposition to vomit. They found the crater to be nearly circular and about a mile in circumference; the shape like that of a tunnel, and the depth immense. The spectacle was awful and appalling.—The eruptions were almost uninterrupted, casting up showers of stones, which fell back within the crater, excepting a small number which fell outside of the opening, and send forth clouds of ashes and smoke. The noise of the eruptions was like thunder, and rose and subsided like the roaring of the sea. Having completed their observations, they retraced their steps, and about night came to the limits of vegetation. The highest point to which they attained was 17,885 feet, (almost 3 1-2 miles) above the level of the sea. On account of clouds, they could see nothing from the top but the summits of Orizaba and Sierra. At the height of 16,893 feet they beheld the city of Mexico, which appeared to them only as a speck.

Singular Battle.—A few days since, a farmer in the town of Jefferson, observed his dung-hill cock engaged in mortal combat with a striped snake of about 18 or 20 inches in length, the cock to all appearance, having the decided advantage over his more wily though less nervous adversary, dealing his blows in quick succession, employing alternately his bill and spurs. But the cunning serpent, well aware that victory must declare against him by fair combat, brought into requisition a portion of the innate cunning for which that reptile has been celebrated from the beginning of the world to the present time; and seizing his antagonist by the thigh, in the rear, he completely secured himself from any further danger from him. Thus situated the cock very naturally thought his only "safety was in flight" he accordingly cleaved the air majestically with his wing, the snake keeping fast his hold, and dangling like a tag-lock.

underneath, until the cock, overcome with fatigue, alighted on a neighboring apple-tree. The snake immediately coiled his tail round a branch of the tree—the cock again attempted flight, but he could scarcely clear the limb, from which he hung with his head downwards, making every effort to escape, but all in vain, until the farmer came to his assistance—killed the snake, and set him at liberty.—*Schoharie Republican.*

DEATH BY POISON.

Died, in Sudbury, on Sunday last, Henry Moore son of Mr. Lewis Moore, aged 6 years. His death was caused by eating the seed of a poisonous weed known by the name of *wild hemlock*, which he mistook for *caraway* seed. He ate this seed on his way to school on Thursday and was seized in a few hours with a severe pain in his bowels, and died on the third day afterward.

Wild Hemlock.—This noxious weed grows in all parts of New England, and is remarkably abundant in our vicinity. It is found chiefly in runs and wet grounds, but is sometimes seen by the road side, or by ditches and fences in dry places. The stalk is purple, except when it grows in a shade, then it is green; the plant is from two to five feet high. The blossoms are straw-colored or nearly white, are set in tufts or clusters at the end of the branches, like the blossoms of *caraway*, carrot, and pansy. The seeds are a virulent poison; they very much resemble *caraway* seeds, and it requires close inspection to distinguish one from the other. It is a very common and beautiful weed; it may be seen in all our meadows and other wet mowing lands growing in luxuriant abundance, over-topping the uncult grass by nearly two feet, branching forth in quite a tree. Its blossoms begin to appear in June and are found through July and August.—*Concord Gazette.*

It is stated by Col. Murray, in a speech before the convention at Albany, that the iron ore of this state may challenge a competition with the world, that the counties of Clinton and Essex manufacture about 2000 tons of bar iron annually, and furnish about 5 or 6000 tons of pig iron, that the furnaces for making the latter have almost suspended their operations.

Mind and Matter.—The ten thousand houses of ancient Athens contained a population of 180,000 inhabitants, of whom 20,000 only were citizens.—The population of the rest of Attica amounted to about 300,000: the slaves were in proportion of 4 to 1. But twenty millions of souls were subject to or depended on this little state!—It possessed a colossal external power, begotten by genius, valor, and patriotism.

At the last York Assize, England, sentence of death was recorded against *seventy-one* prisoners.

We copy with pleasure, the following testimony to the character of the Ink referred to.

Post office, New York March, 19, 1827.

Messrs. Maynard & Noyes.—In answer to your request respecting the Ink that has been used in this office, I state with pleasure that your *writing Ink* is much approved of, and I recommend it as a first rate article to any one who is desirous of using good black writing Ink.

I am, Gentlemen,

Your most ob't servant,

THEODORUS BAILEY.

FELLENBERG SCHOOL AT HOPWYL.

Extract of a letter from John Murray, Esq.—
Sir,—You have in a late number of the Gardener's Magazine, (p. 77.) among your notices of foreign publications, adverted to the 'Annales Agricoles de Roville,' as containing an account of the very interesting establishment of M. Fellenberg at Hofwyl. As I visited these magnificent arrangements on the 26th August, 1825, perhaps a succinct notice may not be uninteresting. I am unwilling, however, to trespass on your valuable pages further than to give a very summary account of what I personally witnessed; especially as there are numerous publications filled with details of these peaceful and interesting scenes.

"The agricultural implements, which are entirely made on the spot, are numerous, varied, and complete, including all the ingenuity of the most recent invention. There is a fine dairy, though none but ordinary cheese is made. The milk is preserved in shallow trays of wood, in subterranean cellars, and the floors frequently sprinkled with water, to keep them cool. There are fifty milk cows, which are regularly corried down and dressed like horses, fourteen horses, and fourteen oxen for labour, which are particularly large, of the Fribourg breed. Liquid manure is duly appreciated, and holds its proper place in the economy of agriculture, which is not merely theoretic, but practical, and that, too, on a magnificent scale.

"On our visit we found that the greater part of the pupils had set out on their annual pedestrian excursion, *via* Neufchatel, under the care of one of the classic tutors. We were informed that there were then ninety-nine scholars. Of these fifteen were English, ten Scotch, including two sons of the eccentric Mr Owen, who had twice visited Hofwyl, two Russians, one Greek, several Danes, Swedes, and Germans; the rest French and Swiss. There were, of course, no Spaniards. Twenty-one masters teach the languages, belles lettres, arithmetic, natural philosophy, chemistry, botany, agriculture, &c. There are five professors for the various accomplishments, as music, drawing, &c. In the saloon for music we noticed two kettle-drums, a grand piano-forte, &c.; and on a large black board were chalked lines and notes, for the use of beginners. They have a concert every month. The various compartments for instruction are arranged with judgment and method; in fact, nothing can be well conceived more complete than the *total ensemble* of this very extraordinary establishment. There is a chapel that serves at once for Protestant and Catholic worship: for the former the altar and imagery of Catholicism are most judiciously concealed from view, being shut up in a convenient case.

"The beds where the pupils repose are elegantly neat, and all subordinated to health and comfort: each insulated compartment has its corresponding closet. In the *salles a manger*, or dining room, is a closet which descends, by means of machinery, into the kitchen beneath, and is wound up again loaded with its covers. Even in the kitchen for the working people we noticed a Pappin's digester. Proper houses and rooms are appropriated for tailors, shoemakers, &c.; and we found the carpenters and mechanics at their respective labours. The children of the poor have gratuitous instruction. A large building is appropriated to horsemanship and various gymnastic exercises, and for the latter there are also erections of wood, &c. without. There is a plot

of ground allowed to each pupil for a garden, in which he may exercise his own taste. There were new edifices being erected for various purposes, and M. Fellenberg superintended them in person. A French Count was very polite to us; even to excess.

"This is a truly peaceful scene. How different that which follows the footsteps of the warrior compared to this? '*Ubi, solitudinem faciunt, hic pacem appellant!*'

"Every thing at Hofwyl is calculated to infuse into the souls of the student the sweets of recreative enjoyment; '*labor ipse voluptas.*' I found M. Fellenberg mild and courteous, intelligent and polite. To say more of such an estimable character would be waste of praise. We left this beautiful domain with regret, to visit Count d'Erlach at Hindlebank, to whom I had an introduction, often contemplating the magnificent appearance of the establishment of Hofwyl in the distant prospect.—*Gardener's Magazine.*

GUINEA GRASS.

This grass, which grows in great abundance in the West Indies, is there of such great utility, that the preservation of the stock in many of the islands, frequently depends on it. A few years ago, a considerable quantity of the seed was brought to New-York; but owing to the want of correct information as to its cultivation, several attempts made to raise it, were unsuccessful, which led to its being abandoned. Among the Bath and West of England Agricultural Society papers, we observe an article on this subject, from the pen of a gentleman in Jamaica, who speaks from his own knowledge as to the manner in which this valuable plant is reared in that colony. He says that it is capable of thriving in any situation, in respect to climate and soil, and can bear the effects of dry or wet weather in a most remarkable manner. It wet weather in grows so fast, that it may be cut once in a fortnight, and sometimes oftener, when the land which yields it is new or fertile.—In dry, it is a long time before it withers, and when reduced thereby to such a state as to seem totally destroyed, will revive with a slight shower in a very few hours; and when rain falls, though in so sparing a degree as to be of little or no service to common pastures, it will occasion this to vegetate, and to be fit for use in a few weeks; nay, in some situations, not too much exposed to the heat of the sun, it is known to flourish, and derive ample support, from occasional dews only. It has, farther, so peculiar a quality of stocking, that, with very little care in its infancy, it will overcome all other grasses and weeds; and in ground full of stones and rocks, though planted at very great distances, at random, as the appearance of soil admits, will spread itself about them, in a few months, and at last cover them entirely. This grass, when ready to seed, is from six to eight feet high; but it is generally fed upon, or cut, when only three or four. It agrees with all kinds of stock; and horses, mules, and cattle, when turned out to feed upon it, will fatten so fast, that the two former will be in good condition in two months, or less; and the latter will become fit for the butcher in the course of three months.

The cultivation of this grass is very easy, and attended with little care, expense, or trouble. It is not immediately produced from the seed, but is previously planted. The land intended for it

is generally made perfectly bare by hoeing, and holes are then dug, from three to five feet distant, varying in this respect according to the quality of the soil; that is, if it be rich, the holes are to be made at a greater, and if poor, at a less distance. These holes should be large, and deep enough to admit, and bury a good depth, a few roots of the grass. The roots to be planted are dug up from a neighbouring field, or nursery; and the grass arising from them being topped, within three or four inches, they are put into each hole, and well covered with earth, pressed down by the foot.—Care is taken to keep the plants free from weeds by repeated hoeings. The months most approved for planting, are April and May, as the grass will then seed in September and October, at which periods it is found to seed by far the most abundantly. It is necessary to be careful that the ground is quite clean when the seed is ready to drop; and if the spaces between the roots are then stirred up with the hoe, it will be found very beneficial.

When the seed is all fallen, stock is turned in to tread it into the ground, and feed upon the grass. In very rich and new land, the grass at first will grow so rank as to produce very thick stalks, which, by running up the noses of the stock, will prevent them from eating it so close as they otherwise would. When, however, it is eaten as near the ground as possible, the remaining grass, with the roots which were planted, are dug up with the hoe and burnt off. The grass after this, if favourable rains attend, will grow from the seed, and by covering the ground in the month of May following, will be perfectly established for several years, according to the quality of the land, so as to be cut for use, or become a pasture.

Whenever the grass grows thin, holes may be opened in such places as may occasionally appear so, and roots again planted to supply it; and by this attention bestowed upon it, a field will scarcely ever be so totally worn out as to require the labour of being at any one time replanted.—The blades of this grass, when flourishing, appear not unlike those of wheat, only rather broader and longer; and the stalks, during the first growth, also much like those of it, but they get weaker and less, the oftener the grass is fed upon or cut, till at last it becomes a fine, rich, and entire sward.

During the first 10 years of the present century, the average quantity of wool imported into Great Britain was 7,200,600 lbs.

The season in England is remarkably fine—and the wheat promises an abundant harvest.

N. York is infested with mad dogs, several persons have recently been bitten by them in that city. It is supposed the hot weather has an influence in causing canine madness.

The fourth of July was marked in Ohio by letting in the water, and navigating the first boats on the Portage Summit of the Ohio Canal.

The following toast was drunk at a late celebration in Upton, Mass.—

The present Militia System of the United States.—Of mammoth size, and puny weight—the poor man's tax—the rich man's scorn—a source of safety to none, and of complaint to all.

TO DESTROY COCKROACHES.

MR SKINNER—I have seen one or two articles in the Farmer, describing ways to destroy cockroaches—they may all be good; but as there will be no harm in multiplying facts, and shewing various ways for obtaining the same results, I will trouble you with my method, which I know by experience to be effectual.

Several years ago, I entered upon the possession of a large old house that had been for some months unoccupied, and I found it swarming with cockroaches. They devoured such clothing as fell in their way, and were in other respects very troublesome and disagreeable. A neighbor kindly suggested a plan for destroying them, which I adopted as follows:

I set two crocks, or earthen pots, each ten or twelve inches high, and about the same in diameter, in the two most infested parts of the house, into which I put a few gills of molasses—against these I leaned shingles, making a bridge from the floor to the rim, that the vermin might easily reach the luscious bait below, whose fragrance filled the chambers; and the better to allure them, I trailed some molasses along the road I intended they should travel to their prisons, and which they did travel in such numbers the first night, that I found the crocks half filled: the second night completed their capture and destruction.

Am. Farmer.

CROPS IN NOVA SCOTIA.

The Editor of this paper having returned from a journey through a large part of the Province of New Brunswick, Prince Edward's Island and the eastern part of this Province has had an opportunity of collecting information as to the state of the crops. It was represented to him, wherever he went, that the season has been in the highest degree favorable to the hopes of the farmer.—Genial showers have been succeeded by dry sultry weather; and the soil has thus been kept in that state of moisture which is best adapted for the full development of its vegetative powers. It is generally thought that there has been no prospect, equal to the present, for these ten years back. The crops of hay are unusually heavy—the grain is strong and verdant—Indian corn vigorous—and the potatoe every where setting up a thick and bushy stem. The general appearance of the country is rich and beautiful.

Hulifax, Novascotian.

Washing Machine.—The New Brunswick Times calls the attention of the public to a Washing Machine exhibiting in that city, by Philip P. Crain. If it deserves the recommendation there given, it is a valuable invention. The editor says it is simple in its construction, is worked with little labour, and does the washing in the best manner, and with less injury to the finest garments than the ordinary mode. It is calculated that a woman will do more washing in two hours than can be performed in a day by the common process.

Connecticut.—A State Convention was held at Middletown, Conn. on the 12th inst. at which it was voted, that this meeting highly approve of the contemplated Convention at Harrisburgh, on the 30th day of July inst. and of the objects intended to be promoted thereby, and that Timothy Pitkin, Henry Watson, Henry L. Ellsworth, Gideon Wells, Jonathan Rose, Sheldon Clark, James M. L. Scovill, Calvin Goddard, Thomas S. Perkins,

Samuel W. Johnson, John Q. Wilson, James McClellan, John A. Taintor, Lemuel Hurlbut, Sheldon C. Leavitt, John R. Watkinson, Wedworth Wadsworth, Francis McLean, John Hall, &c. and they are hereby appointed Delegates to said Convention, and requested to co-operate with the other members thereof, in all lawful and proper means for the protection and encouragement of Domestic Industry and National Independence.

Horse Chesnuts.—A permanent buff, or nankeen die, for muslin, linen, cotton, silk, or woollen cloths, may be obtained from the horse chesnuts. For the buff colour, take the whole fruit, husk and all, when quite young; cut it small, and put it into cold soft water, with as much soap as will just colour or discolour the water. When deep enough, pour off the clear part, and dip whatever is to be dyed, till it is the colour required. For the nankeen colour, take the husks of the fruit only; cut or break them small; steep them in soft water, with soap as above, and die in the same manner. The husks may be used for the buff dye, after the kernels are formed; but it is only when they are most imperceptible that the whole fruit is used, and the brightness of the buff colour diminishes as the husk ripens, till when quite ripe, the die is like little nankeen.

Indian Ink.—Hold a plate over the flame of a lamp or candle, to obtain the fine soot, which mix with clean size. The Indian ink of the shops is usually scented with musk.

To kill flies.—To a table-spoonful of milk, add one tea-spoonful of black pepper, and one tea-spoonful of brown sugar. Put them in a small plate or saucer, and place it where the flies are most numerous.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JULY 27, 1827.

PARING AND BURNING THE SOIL.

Paring and burning is the process of paring off the surface of lands, and preparing the soil, by means of fire for arable crops. It is more particularly adapted to the improvement of soils which are overrun by the roots of vegetables that cannot be destroyed by the modes of cultivation, generally made use of; and to stiff clays, which by being burnt are converted into a kind of manure very useful in many soils. There has been a diversity of opinion among agriculturists respecting the propriety of making use of this process to subdue a refractory soil. Burning soils no doubt may destroy much vegetable matter, which under favorable circumstances might have been converted into food for plants. But it often happens that there exists in a field an excess of vegetable matter, which is scarcely possible to decompose without great expense and delay, in such a manner that it can furnish nutriment to plants, except by the agency of fire. Burning, likewise, renders clays less coherent, and in this way greatly improves their texture, and causes them to be more permeable to water, and of course they are less apt to retain it in a state of stagnation. A cause of the unproductiveness of cold clayey adhesive soils, is, that the seed is coated with matter impenetrable to air. When clayey or tenacious soils are burnt, their power and tendency to absorb water from the atmosphere is diminished in the

proportion of 7 to 2; and they are brought nearer to a state analogous to that of sands: the particles are less adhesive, and the mass less retentive of moisture. Thus the process of burning, properly applied, may convert a matter that was stiff, damp, and in consequence cold, into one powdery, dry and warm; altogether more fitly constituted as a bed for vegetable life. The great objection made by speculative chemists to paring and burning, is, that the animal and vegetable matter in the soil is diminished:—But where the texture of the earthy ingredients is permanently improved, there is more than a compensation. To meet the objection still more directly, when an excess of inert vegetable matter is present, the destruction of a part of it must be beneficial; and the carbonaceous matter in the ashes may be more useful to the crop, than the unreduced vegetable fibre, of which it is the remains, could have been.

"The most speedy way of bringing under tillage a meadow overrun with rushes, is; first to drain it, and then to pare off a thick turf and burn it.

"The cases in which burning must incontestably be prejudicial, are those of sandy, dry, flinty soils, containing little animal or vegetable matter; here it can only be destructive; for it decomposes that constituent which is already below the minimum proportion, and in the presence of which, in a limited degree, the productiveness of a soil depends."

The late Mr Nicholson of New York, in a prize essay, appended to *The Farmer's Assistant*, thus describes the operation of paring and burning.—When the ground is in a good sward of grass let it be carefully turned over with the plough; the irons of which should be well sharpened. Let the plough run about three inches deep. Then cross plough with a sharp coulter, and the sward will all be cut into squares of ten or twelve inches.—Set these square chunks up edgewise, by leaning two together, and they will soon dry. When well dried, build a part of them up in the form of little ovens, at the distance of about eighteen feet each way. These are to have a little opening or door, at a common windward side, for the air to enter and another opening above, for the smoke to pass off. On some dry day, when the wind is fair for blowing into the holes below, place some straw or other dry rubbish into the holes, and set fire to it. As soon as the fires have got fully going in each of the heaps, let the holes in the tops be stopped up, for the purpose of retaining the smoke and keep gradually building up the heaps as the fire penetrates them, until all the chunks of earth are piled round them; and when the heaps have fully burned and sufficiently cooled they are to be evenly spread over the ground, and ploughed."

The following is Mr Cobbett's method of burning earth:—Make a circle or an oblong square, cut sods and build a wall all round three feet thick and four feet high, then light a fire in the middle with straw, dry sticks, &c. extending it all over the bottom of the pit; keep adding light fuel at first, then rubbish wood, till there is a good bed of coals. Then put on the driest of the clods, taking care to keep the smoke in. Continue thus for a day or two, when you may dig out the earth any where about the kiln and fling on. Put your finger into the top of the heap here and there; if you find the fire very near, throw on more earth; not too much at a time for it deadens the fire.—The ashes (or torrefied earth) will be cool enough.

to remove in a week, peat or bog earth may be burnt in the same way or *dry*, as in the paring and burning method. Some only kindle a fire and lay on dry soils as at first, and when the whole is under good way, throw on the earth, (subsoil, &c.) torrefied, till the heap is sufficiently large. This manure applied to cabbages, ruta baga, Indian corn and buck wheat produces great effect."

It will be observed that Mr Cobbett's directions are intended not only for burning the *surface* of the soil, but for burning *earth*, including subsoil, to any convenient depth for manure. If the subsoil is wholly, or in part, clay, or, perhaps, any other species of earth, in which there is but little silicious sand, it may, in many cases, be expedient to dry it and burn it for manure.

It is observed by the Rev. Mr CARSWRIGHT, an English writer on agriculture, that in performing the operations of burning "care should be taken to do it with a smothering heat; for if the fires are too intense, the ashes will be of an inferior quality. The advantages of this practice are numerous; for it in a great measure annihilates seed weeds: it is destructive to many kinds of insects and other vermin, noxious to agriculture; it decomposes whatever comes within the sphere of its activity; and the ashes it produces neutralize the soil, and assist in the further decomposition of the vegetable and animal matters contained in it; and these substances it converts into suitable food for future crops. Its operation on the soil is something like the operation of malting on grain causing it to part freely with its most nutritious principle, the saccharine matter; so will paring and burning dispose the soil profusely to part with its nutrition to the plants which are committed to it; and this it will do, not for a single year only, but for several years, according to the original degree of fertility, in succession; and if the crops are exhausting ones, till it is soon worn out. Hence on pared and burnt land, more so perhaps than on any other, no two exhausting crops should follow each other. By exhausting crops are understood, wheat, rye, barley, oats, and buckwheat; by fertilizing ones, crops of every kind which are consumed upon the land or mown, or carried off before they perfect their seed, and which are bro't back again in the state of manure."

HAY.

It is stated in Young's Farmer's Calendar that Mr Duckett, a celebrated farmer in England made use of the following method of trying the heat of his hay-stacks. "He thrust a scaffold bolt, or other stout and long iron bolt into a stack, to give easy admission to a gun rod, with a strong worm at the end of it, with which he screws out a sample, and discovers not only the heat, but the colour of the hay; if the stack wants air, he makes many of these holes, which give vent to the heat, and answers the purpose of a chimney."

SOILING LABOURING OXEN AND HORSES.

Instead of burning your oxen and horses, which you have occasion to use frequently, into a large pasture where it is almost as difficult to find them as it is to find out the longitude, and to take and harness them as it would be for any body but a poet to tackle the steeds of Apollo, you had better *soil* them. By soiling is meant keeping them in stables, stalls, yards, &c. and mowing and giving them grass and other green and dry food.—

You must be careful that they have always water at hand, and plenty of litter to absorb the liquid manure, unless you have reservoirs, &c. to answer the purpose of preventing its waste. Mr Young said that "Lucerne is the best plant for soiling, and an acre of it will go much further than any thing else. But clover or any other grass, green or dry, oats or Indian corn, cut up near the roots, cabbages, &c. &c. may often be economically disposed of in feeding cattle and horses, whose services are requisite for the prosecution of the daily and hourly labours of the husbandman.

RHEUMATISM.

We are assured by a person who has experienced its effects, that the following is excellent for rheumatic complaints: spirits of hartshorn $\frac{1}{2}$ oz. sweet oil $\frac{1}{2}$ oz. laudanum $\frac{1}{2}$ of an oz. honey $\frac{1}{2}$ of an oz. Mix, and apply with friction to the part affected. Bind on flannel to keep the part warm, and make use of the ointment morning and evening. The above ointment, says our informant, is likewise useful in sprains, and other cases in which opodeldoc is recommended.

CURE FOR THE RING WORM.

A friend in Charlestown has given us the following recipe, which he says he has known to effect a cure of the ring worm in very obstinate cases:—Take a half pint tumbler, and fill it nearly full of strong vinegar—then put in a new laid egg, (the newer the better)—let the egg remain a few days till the vinegar eats the shell entirely off—then throw away the egg, and apply the vinegar, thus prepared, to the part affected, once a day, for a week or ten days, which will effect a cure. During the application, it is necessary to keep the bowels open, by salts or some gentle medicine.

First voyage of Columbus.—The public will be pleased to learn that a translation of the valuable and interesting documents relative to the first voyage of Columbus, is in progress, in Boston, and the printing of the work commenced. The originals of these documents were discovered in 1789, among the archives of the Duke del Infantado.—They were not published until a year or two since, when they were given to the public by order of the present king of Spain. The manuscript is said to be in the hand writing of Las Casas, and to be an abstract of the original journal of Columbus, made by this author while compiling his history of the Indies. It is the form of a diary at sea, and is probably more interesting from not being elaborated. Its authenticity is said to be unquestionable.

The following gentlemen have been chosen delegates to represent Maine in the General Convention of Farmers and Manufacturers to be held at Harrisburgh, Penn. on the 20th inst. The Hon. John Holmes, of York. Wm. Ladd, Esq. of Cumberland, Gen. Joshua Wingate of Kennebec, Brice M. Lellan, Esq. of Somerset, and Gen. Jedediah Kenrick, of Penobscot.

American Paper.—The Editor of the N. York Enquirer complains that American Printing Paper has depreciated in quality, at the same prices.—He invites good specimens to be sent to his office, with the prices, and promises to procure customers for as much of the best sample as the skills can turn out.

It is not easy to perceive (says the Palladium, why a "Lace School," to employ profitably "500 young ladies" might not flourish in Boston as well as Newport. The former has about 60,000 inhabitants, and Newport about 10,000. Hand Looms might also be employed in Boston as well Philadelphia. It is said there are 4000 at work in the latter city in muslin weaving.

A London paper of June 8, states that the British Ambassador at Constantinople had sent a despatch, announcing the entire defeat of the Turks before Athens, on the 29th of April; loss said to be 10,000 men. Ratisbon letters of the 26th of May, confirm the above, and state that the Turks were successively driven from all their entrenchments, and forced to abandon all their artillery and baggage. The Lords High Commissioners of the Ionian Islands, on the 5th of May, despatched a courier from Corfu to London with another confirmation of the above.

A letter has been received in Richmond Va. giving the unwelcome intelligence that Mr Madison was taken extremely ill with the cholera morbus in the night of the 11th, but that on the morning of the 12th he was better.

Eggs.—Mr Loudon says that if eggs are left unmoved for some time the yolks subside, and come at length to touch the shells on the lower side, when rotteness immediately commences.—In some parts of England, they hang up eggs in nets and turn them every day, to prevent the yolk's coming to the shell; in others, they anoint them with melted mutton suet, and set them on end in bran, the containing box being closely covered.

Hamp. Gazette.

Wool in England.—On the 7th of June, in the house of lords, the earl of Winchelsea presented a petition signed by upwards of 400 flock-masters, complaining of the importation of foreign wool.—The petition was supported by the earl of Malmesbury, who stated that during the last three years the quantity of foreign wool imported was £2,308,000 pounds, of which 51,412,000 pounds were from Germany. The consequence was that British wool had fallen from 22d (40 cents) to 9d (17 cents.) Lord Goderich said in reply that to encourage the British wool-growers by a heavy duty on foreign wool, would not produce the desired effect, but quite the reverse. "If we impose a duty on foreign wool, we shall lose a great share of the trade in woollens with foreign countries, and thereby reduce the price of our own wool."—He said the best remedy was to establish markets for woollen goods on an extensive scale.—*Ibid.*

Currant Jelly.—There is a demand for this article in this place, and those who have an abundance of currants, will do well, perhaps, to pay some attention to it. It is made by mixing currant juice and sugar, and boiling them gently for two hours or more, and taking off the scum that arises. Some use one pound of brown sugar, to a quart of juice; others two pounds; and some two pounds of loaf sugar. The price depends on the richness and niceness of the jelly. It will probably bring from 50 to 75 cents per quart, if well made, and the quantity offered does not exceed the demand. There may be other modes of manufacturing it, which are better than the one we have mentioned. [Ibid.]

Bricks.—In the vicinity of London upwards of 2000 acres have been dug to the depth of from 4 to 10 feet for brick earth. The bricks from an acre of brick-earth produce about 18,000 dollars; and the sum paid to the owners of the soil is \$2200 per acre. An acre at 4 feet deep yields 4 millions of bricks. In the manufacture of bricks, the earth is mixed with coal-ashes and sand.—*Ib.*

The election of a representative in Congress in this city on the 23d inst. terminated in favor of Hon. BENJAMIN GORHAM. The votes were, Gorham 1659, Blake 608, Henshaw 459. Scattering 122.

Onions.—Mr. William Simonds has raised in his garden in this city, an astonishing crop of onions, considering the number planted, and the ground occupied. In two beds, each of 10 1-2 feet long, and 3 feet wide, he planted, in the spring, 532 of the Egyptian onions, which propagate from the root, and bear no seed at the top.—From these, he pulled a few days since, 2,640 onions many of them of a very large size, each onion planted having a number of others from 3 to 15 clustered around the root, and almost all of them large enough for the purpose of cooking. Sometimes as many as 18 have been produced from a single plant. The onions are of superior flavor, to almost any other of that class of esculents.—*Trenton True American.*

Remedies for the Tooth Ache.—Make a solution of Camphor and pulverised Cayenne pepper: dip thereto a small quantity of raw cotton and apply it to the affected tooth, and it will give instant relief. To prevent the composition's getting to the throat, lay a bit of rag over the tooth for a few moments. [Wilmington Herald.]

2 drachms of alum reduced to an impalpable powder, and 7 drachms of nitrous spirits of either, mixed and applied to the tooth, will prove effectual in 95 out of 100 cases. [Ibid.]

Extraordinary Cow.—A Cow belonging to a gentleman in this town, yielded yesterday at a single milking, *eighteen quarts* of milk. This milking was at two o'clock P. M. after an absence in the pasture of about 18 hours. She was milked again between 6 and 7 in the evening, and gave seven quarts more, making in all, *upwards of six gallons of milk drawn from the same cow within the short space of five hours.* [Hal. Adv.]

Remedy for Intemperance.—Messrs Reed & Howard, druggists, 44 Hanover-street, have prepared a medicine for the cure of Drunkenness, which has been fully tested by several respectable physicians of this city, and is found to possess *all the qualities* of Dr Claubers' composition.

Apricots, some of which measured *seven inches* round, have been taken from a tree in the rear of a gentleman's dwelling in Philadelphia.

Upwards of 30,000 lbs. of sugar, and 10,000 lbs. of molasses, were made in Louisiana last season.

It is reported that the Spanish minister has represented to our government, the irregular conduct of Com. Perter, in taking a station in a port in the United States, to annoy the commerce of this country.

Palm-leaf hats are now made, on an extensive scale, by Mr. Jabez Boyden, of Dedham, near Boston, Mass.

Fever and Ague.—Take 2 ounces of Peruvian bark, 2 of powdered cloves, and 1 of cream of tartar: mix them together; divide the composition into 12 equal doses; and take one dose every morning, noon, and night till the complaint is checked; then one every morning till the whole is taken. Each dose may be taken in a glass of any kind of spirituous liquor mixed with water.—*Emporium.*

Stirups and Bedsteads.—A Mr Powles of Philadelphia has invented a safety stirup to avoid the danger of having the foot caught when a person is thrown from his horse. He has also brought to perfection a *bedstead*, so arranged, that the sickening may be kept continually stretched and the joints so close as to afford no accommodation for the "red coats," those backbiting gentry that "murder sleep."

Mowing.—At a mowing match on the 4th of July at Canandaigua, N. Y. 14 candidates entered for the 6 premiums to be awarded to the man who should cut the most grass in the best manner, in one minute. The first (a fine scythe with snath) was awarded to Calvin Simmons, who cut 58 1/2 square feet; swath 9 feet 2 inches wide. The second (an axe) to John Kent, who cut 511 square feet; swath 9 feet inches wide. The third (a hoe) to John Woby, a coloured man, who cut 546 square feet; swath 9 feet wide. The fifth (a spade) to Elias Russell, who cut 557 square feet; swath 9 feet wide. The sixth (a shovel) to K. Murray, who cut 496 square feet; swath 8 feet wide. All the work was extremely well done. The premium articles were all of elegant workmanship.

Rail Roads.—The Mass. Journal of the 19th inst. contains copies of a correspondence between Governor Lincoln and the Hon. James Barbour, Secretary of War, relative to the contemplated rail road from Boston to the Hudson. The object of Governor Lincoln was, to ascertain how far it was in the power or disposition of that Department, to aid in the necessary examination of the country of the proposed route, during the present season. Mr Barbour replied that all the officers under the control of his department for similar purposes, were already engaged for the whole season, and that no co-operation could be expected from him. He considers the object of the contemplated undertaking of very great importance, and declares his readiness to co-operate in its execution whenever means will justify it. [Totland Advertiser.]

Marchioness of Wellesley.—We learn by the ship New-York, that this lady, (late Miss Caton of Baltimore,) left Dublin the latter end of April for London, where she still remains; and reports says, for six months previous to her departure, she and the Marquis had not exchanged a word with each other, nor eat at the same table; this is an excellent episode to the loving letter he wrote to our Aldermen, a few months ago, acknowledging the receipt of the canal Medal, and the volume of its history. [Morning Chronicle.]

Indians.—It is almost as great a curiosity to see an Indian now a days in this quarter of our country, as it would be at Philadelphia. Not long since, four of these sons of the forest made their appearance, about twenty miles north-west of this place, and were observed to loiter about one particular farm for the most of a day, when they borrowed a spade; went into a corner of one of the farmer's fields, and dug up three or four small sized brass kettles, which must have been buried there long before the improvements were made. This done, they talked together for some time, pointed with their fingers in different directions, then hung the kettles on their backs, and walked quietly off towards the setting sun in Indian file.—*Erie (Pa.) paper.*

Saxony Sheep.
On Friday the 21th August next, at 3 o'clock P. M. at Brighton near Boston, will be sold by public auction, a choice stock of about 100 Saxony Rams, just imported in the brig Comet, Capt. Meel, from Hamburg.
These sheep were selected from the purest blood in the kingdom, and will be found at least, equal in point of fineness of fleece and symmetry of form to any heretofore imported. The sale will be perfectly free and unlimited.

Samples of the wool from different parts of each animal may be seen at No. 46 Central street, or at the office of the auctioneers, at any time previous to the sale. COOLIDGE, POOR & HEARD.

ROMAN. This elegant, full blooded horse, a bright bay, with black legs, mane and tail, of high spirit and good temper, will stand at the farm of Mr Stephen Williams in Northborough (Ms.) at \$20 the season, to be paid before the mares are taken away.—See New England Farmer, May 25.

Subscribers to the New England Farmer are informed that they can have their volumes neatly bound and lettered at 75 cents, which is as cheap as they can be done in this city—by sending them to this office. Subscribers who began after the last volume commenced can be supplied with the deficient numbers.

PRICES OF COUNTRY PRODUCE.

Corrected every Thursday evening.

Miscellaneous.

From the Worcester Regis.

THE WONDERS OF THE DEEP.

The bounty of nature has spread flowers and herbs over hill and valley with boundless profusion. The insect hosts flutter in the sunshine or hum among the trees. Field and forest are swarming with life in its various forms. The varieties of animated being, forming a chain of existence extending to objects so minute as to elude the sight, and rising so high as to exceed the power of human observation, have been diligently examined, and catalogues and descriptions tell us the names and inform us of the manners and habits of many of the tribes of earth and air. The waters equally populous, have of course been less successfully explored. Of the monsters who feed among the caves, or gambol in the deep, we yet know but little. Occasionally some odd fish presents himself to the observation of the sailor, and the account given of its appearance is so strange that we rank it with "fish stories." Although the Sea Serpent has figured so much in the waters along our shores, and in the depositions of those gentlemen who saw the terrible glitter of his eyes through telescopes, we are still left in doubt whether it be a creature of real existence or of imagination. The diving bell has occasionally been employed in the examination of shallow places to direct the labors of industry, but the boldness of adventure never has descended to those depths where we should expect to find the haunts of monsters, and one of the most remarkable inventions of modern improvement has been ineffectual in reclaiming the treasures of human wealth gathered during successive centuries to the deep, or in discovering the gems and metals, the spars and corals that adorn its cells. Scientific enquiry has been busy in examining those animated beings so infinitely varied in form and structure and so multiplied as to exceed the power of figures to number, floating on the surface. The following extract from Scoresby, copied into the last American Quarterly Review, shows the known myriads of the population of the sea, and may give some idea of the probable extent.

"The number of medusæ," says Scoresby, "in the olive green sea, was found to be immense.—They are about one fourth of an inch asunder.—In this proportion, a cubic inch of water must contain 64; a cubic foot 110,592; a cubic fathom, 23,887,872; and a cubic mile, about 23,888,000,000,000,000! From soundings made in the situation where these animals were found, it is probable the sea is upwards of a mile in depth; but whether these substances occupy the whole depth, is uncertain. Provided however the depth to which they entered be but 250 fathoms, the above immense number of one species may occur in a space of two miles square. It may give a better conception of the amount of medusæ in this extent, if we calculate the length of time that would be requisite with a certain number of persons for counting this number. Allowing that one person could count a million in seven days, which is barely possible, it would have required that 20,000 persons should have started at the creation of the world, to complete the enumeration at the present time."

What a stupendous idea this fact gives of the

immensity of creation, and of the bounty of Divine Providence, in furnishing such a profusion of life in a region so remote from the haunts of men! But if the number of animals in the space of two miles square be so great, what must be the amount requisite for the discoloration of the sea through an extent of perhaps twenty or thirty thousand square miles." [Arctic Voyages, p. 180.]

RULES FOR GOOD MANNERS.

1. If you are at work near a man, be sure to stop, and look at every one who passes by, from the time he first makes his appearance, until he is out of sight. No one, who has not had the experience of it, can tell how much pleasure there is in seeing half a dozen men abandon their employment and gaze at him, as though they had never before seen a mortal, or were desirous to see every button on his garments.

2. When you are passing by neighbors at work never fail to stop and talk with them, especially if they are engaged in doing something of considerable importance. Every one must perceive how agreeable it is to a man to be obliged by the rules of good manners to suspend his labor an hour, especially if he has several hired men in company with him, to a trilling story, or to hear the history of his neighbor's affairs.

3. When a person passes by your house, never fail to deck the windows with as many faces as the house can supply; and if the windows will not accommodate all, let one or two stand in the door.

4. If you are passing by a house be careful to look into the windows; by this you may generally know whether its occupants are industrious.—You will likewise occasionally get a glance at a young lady as she sits in the parlor, reading novels, braiding straw, or working lace; which to say the least is worth a shilling.

5. On the sabbath take your stand before the meeting house at least fifteen or twenty minutes before the season of worship commences, and let no one escape your notice, who may come to the house of worship. The pleasure which the young lady experiences, passing twenty or thirty young gentlemen gazing intently at her, may be easily imagined; and if perchance she drop her glove or handkerchief, let the blush on her face tell how delightful the task is to pick it up.—*N. H. Sentinel.*

A gentleman made a very good reply to one who asserted that he did not believe there was a truly honest man in the whole world. "Sir," said he, "it is quite impossible that any one man should know all the world; but it is quite possible that some one man may know himself!"

Praise.—Praise is like ambergris. A little whiff of it, and by snatches, is very agreeable; but when a man holds a whole lump of it to your nose, it is a nuisance, and strikes you down.

Friends bought with money, fill with money likes; Those won by merit, not till merit dies!

Original Anecdote.—A schoolmaster in one of the neighbouring towns, while upon his morning's walk, passed by the door of a neighbor who was excavating a log for a pigs-trough. "Why," said the schoolmaster, "M.—, have you not furniture enough yet?" "Yes," said the man, "enough for my own family, but I expect to board the master this winter, and am making preparations."

A poor ragged urchin was tried (at the last Westmoreland Sessions) for stealing an old jacket from a lime-kilo; proof "was strong as holy writ," the Charman summed up with clearness and the wisdom of the county jury was now to be condensed. After a long deliberation on this knotty point, they turned round—"Gentlemen, have you agreed upon your verdict?" when the Foreman peeped cunningly from beneath a shaggy front, with about as much intelligence in it as that contained in the face of an ourang-outang, and said, "not guilty; but he ought to be severely reprimanded for stealing it."

I lay it down as a sacred maxim, that every man is wretched in proportion to his vices; and affirm the noblest ornament of a young, generous mind, and the surest source of pleasure, profit, and reputation in life, to be an unreserved acceptance of virtue. [Letters concerning Mythology.]

Great Tunnel through the Silver Mine of Kingsberg, in Norway.—A wonderful gallery has been pierced through the side of the mountain, at the depth of six hundred feet, through which the ore is now transported, instead of being hoisted to the top.—Its length is six thousand feet, and it occupied twenty-three years in its completion. It had been commenced in 1793, but during seven years of one time it was discontinued; it had just been opened. The process was most tedious, being entirely by calcination and hammering, which bro't the rock off in flakes. Only two men could work at a time; they both commenced externally; and to their credit be it recorded, that upon meeting they were only two or three feet difference in the level, and none in the direction; it is from six to seven feet wide, and from ten to fifteen high.—*Jones' Travels.*

A Green Old Age.—Mr. Moore, of Ellsworth, Me. now in his 78th year, is stated in the Ellsworth Courier to have made with his own hands, during the last nine months, 56,400 good shingles which have been sold for \$168, besides attending to the work of a farm. He can hoe, mow or rake as much in a day as any common man wishes to do.

By a letter from a gentleman now in Dresden, Saxony, it appears that the government of that country is giving particular attention to the extension of its trade and commerce—that it is desirous of increasing its commercial intercourse with the United States, and for this purpose has lately appointed Consuls to reside in our principal Sea Ports.

Yellow Locust Seed, &c.

For sale at the New England Farmer office, a few lbs. Yellow Locust Seed, superior scarlet short top Radish, White Mulberry, 13 varieties of Turnip, Girkon or pickling Cucumber, &c. with a new assortment of ornamental flower seeds.

A young gentleman who has had advantages of the best academic, university and professional education, and of acquiring the French and Italian languages abroad, wishes to obtain a situation which would be permanent, as professor or tutor in a college, or instructor in an academy or school. Any propositions, present or prospective, addressed to A. B. care of Rev. Dr. Jenks, East Mass. will receive immediate attention.

The FARMER is published every Friday, at \$3.00 per annum, or \$1.50 if paid in advance.

Gentlemen who procure five responsible subscribers, are entitled to a sixth volume gratis.

NATURAL HISTORY.

The following essay upon the natural history of the Rose Bug was prepared by Dr T. W. Harris of Milton, with a view to the premium offered by the Massachusetts Society for promoting Agriculture, for the best essay on this subject; but the professional avocations of the amiable and learned writer having prevented the completion of it within the period fixed by the Trustees, he had resolved to suppress it. The progress which he had made having come to the knowledge of the President of that Society, he urged Dr Harris to lay it before the Trustees in its present state, and they were pleased to award the Society's premium to the author. We think the readers of this journal will feel obliged to us for inserting it.]—*Ed. Mass. Ag. Repos.*

Minutes towards a history of some American species of MELOLONTHE particularly injurious to Vegetation.

Nempe *Melolontha dicitur*, quia pomorum est perniciosa.

The Linnaean genus *SCARABÆUS* is very abundant in species, and exceedingly numerous in individuals of some species. These insects are easily recognized by their moveable horns, or *antennæ*, projecting above the mouth, and terminated by several lamellated, or leaf-like joints, whence they have received the name of Lamellicorn beetles.—This genus contains insects differing much in external appearance, and in their modes of life, and has therefore been subdivided into several smaller genera by the Entomologists who have succeeded Linne. De Geer distinguished three families, according to their habits, which he called *Scarabæus de terre* (Earth beetles), *Scarabæus des arboris* (Tree beetles), *Scarabæus des fleurs*, (Flower-beetles).—Those of the second family are most interesting to the agriculturalist, because of their extensive ravages. They are included by Fabricius in his genus *MELOLONTHA*, a word used by the Greeks to distinguish these same insects, and which signified, according to Enstathius, that they were produced from or with the flowers of apple trees.* The *MELOLONTHE* are called in England *dorrs* or *chaffers*.

The genus *MELOLONTHA* may be characterized as having the *body* oblong, oval, and convex; the mouth covered above by a thin plate, called *clypeus*, beneath which are situated the *antennæ*, consisting generally of ten joints, the terminal ones united by one end to a common centre, and expanding like the leaves of a book; the *thorax* (situated behind the head) convex, more or less quadrate or trapezoidal; immediately behind this, and between the wing-cases, a small triangular piece called *scutellum*; wing-cases or *elytra*

* The French name is *hameton*, probably a corruption of *aliton* from *ali* and *lono*; to make a loud noise with the wings. By several critics the *Jelek* of the Hebrews, translated *canker-worm*, was considered as some insect of this genus. The words of Nahum, III 17, appear particularly characteristic of the manners of the nocturnal species: "which camp in the hedges in the cold day, but when the sun ariseth they flee away, and their place is not known where they are."

convex above, not embracing the sides of the body, and leaving the posterior extremity exposed; legs of moderate length; the middle part or *tibia* of the anterior ones armed with two or three lateral teeth; and each foot, or *tarsus*, consisting of five small joints, and terminated by two strong claws or *nails*.

The general habits and metamorphoses of these insects are invariable; a description of those of the common cock-chaffer of Europe, (*MELOLONTHA vulgaris* L.) will serve to elucidate those of the whole genus. These are detailed by Latreille (in the tenth volume of his *Historie Naturelle*, embodied in *Sonin's Buffon*), and by Olivier, in the first volume of his *Entomology*.

This insect devours the leaves of trees and shrubs. Its duration in the perfect state is very short, each individual living only about a week, and the species entirely disappearing in the course of a month. After the sexual union has taken place the males perish, and the females enter the earth, to the depth of six inches, or more, making their way by means of the strong teeth which arm their anterior tibiae: here they deposit their eggs, amounting to nearly one hundred in number, from every female, which are soon after abandoned, and the females ascend to the surface, and, after languishing a few days, perish also.

From the eggs are hatched, by the warmth of the earth, little whitish grubs, called, in France, *vers blancs*, each provided with six legs, situated near the head, and the mouth furnished with two strong jaws. They live on the roots of plants and other vegetable substances found in the ground; gradually increase in size, and change their skins once a year, about the commencement of spring, after which they approach nearer the surface in search of food; for during the winter they do not eat, but, having penetrated below the reach of frost, remain torpid until the succeeding spring. At the close of their third summer they cease eating, and penetrate about two feet deep into the earth: there by its motions from side to side the grub forms an oval cavity, which is lined by its excrements, and some glutinous fibres, in which it is changed to a pupa by casting its last larva skin. In this state the legs, antennæ, and wing-cases are visible through the transparent skin which envelops them, but appear of a yellowish white colour; and thus it remains until the approach of the ensuing spring, when the thin film which encloses its body and limbs is rent, and the perfect insect digs its way to the surface of the ground, where the superabundant moisture with which it is imbued, is exhaled, and it expands its wings and takes flight.

According to Kirby and Spence the grub of the cock-chaffer sometimes destroys whole acres of grass, by feeding on its roots. It undermines the richest meadows, and so loosens the earth that it will roll up as if cut by a turning spade. About seventy years ago, a farmer near Norwich in England, suffered much by them, and, with his men, gathered eighty bushels of the beetle. In the year 1785 many provinces in France were so ravaged by them, that a premium was offered by government for the best mode of destroying them.—

They do not confine themselves to grass, but eat also the roots of wheat and other grains.

In their perfect state those, with several other species, act as conspicuous a part in injuring the trees as their grubs do in destroying the herbage. Besides the leaves of fruit trees they devour those of the sycamore, the lime, the beech, and the elm. Mousset relates that, in the year 1574, such a number of them fell into the river Severn, as to stop the wheels of the water-mills; and, in the Philosophical Transactions it is stated that, in the year 1638, they filled the hedges and trees of Galway in such infinite numbers, as to cling to each other like bees when they swarm; and when on the wing darkened the air, annoyed travellers, and produced a sound like distant drums. In a short time the leaves of all the trees for some miles round were so totally consumed by them, that at midsummer, the country wore the aspect of the depth of winter.

Another chaffer (*MELOLONTHA vitis* L.) is sometimes exceedingly injurious to the vine. It prevails in certain provinces of France, where it strips the vines of their leaves, and also devours those of the willow, poplar, and fruit trees.

The animals and birds, appointed to check the ravages of these insects, are, according to Latreille, the common dung hill fowls, different species of owl, the European goat-sucker or night hawk (*CAPRIMULGUS Europæus*), bats, rats, the weasel (*MUSTELA vulgaris*), the martin (*MUSTELA foinea*) and the badger, (*URSUS meles*.) To this list may be added the common crow, which devours not only the perfect insect but their larvæ, for which purpose it is often observed to follow the plough. Our own country abounds in insectivorous beasts and birds, and, without doubt, the more than abundant *MELOLONTHE* form a portion of their nourishment.

We have several allied species of *MELOLONTHA* whose injuries in the perfect and grub state approach to those of the European cock-chaffer.—The most common one is the *M. quercina* of Knoch; (in *Melzheimer's catalogue*;) it is not described by any author to which I have had access. It is of a dark chestnut-brown colour, glabrous, punctate; the breast pubescent; and each elytron with three elevated lines; length eight tenths, breadth nine twentieths of an inch. This insect agrees very well with the figure and descriptions of *M. ferride* of Olivier; but, on the authority of Mr Say, it is considered as the species described by Knoch (in his *Nouv. Beitrage zur Insectenkunde*) by the name of *quercina*. In its perfect state it feeds on the leaves of trees, particularly of the cherry-tree. It flies with a humming noise in the night, from the middle of May till the end of June, and frequently enters houses, attracted by the light. The grubs devour the roots of grass and other vegetables; in many places the turf may be turned up like a carpet, in consequence of the destruction of the roots. The grub is a white worm, with a brownish head, and when fully grown nearly as thick as the little finger.* It is eaten with avidity by

* There is a grub, somewhat resembling this, which is frequently found beneath manure-heaps,

crows and fowls. The perfect insect is devoured by some insectivorous animal, which frequents our gardens for that purpose, and whose beneficial foraging is detected by its abundant excrement, filled with the wing-cases of the MELOLONTA.

M. balia, (Say), a smaller species than the *quercina*, may, according to Mr Melsheimer, "be found in its proper season in vast numbers under the deciduous leaves of forests: during the night the millions of wings that fan the air produce a loud humming sound, not unlike that emitted by the enraged occupants of a humble-bees' nest." This species, with another, *M. hirsuta*, (Knöch), are found in Massachusetts, but not in such quantities as the *quercina*. The *balia* is of a light chestnut brown; head and thorax blackish brown; the former and the breast beneath hairy. It is rather more than thirteen twentieths of an inch long.—*M. hirsuta* is dark chestnut, and hairy; the thorax with dilated punctures, and the wing-cases with five or six longitudinal series of hairs on each.—Length seven tenths of an inch.

Several other species are common here, but their specific names are at present unknown to me. Of the smaller ones, are some which attack the wild rose and whortle-berry bushes. These are *M. vespertina* and *M. sericea* of Knöch, and *M. violor* of Say. About the last of June and first of July the two first of these species may be found in the evening on the *Rosa rubiginosa*, in great abundance, and generally paired. Mr Melsheimer says that *M. violor* "abounds in hilly and mountainous situations, where, in the month of May, the time of the sexual union of the species, it may be seen flying amongst the whortle-berry bushes in profusion."

These species are nocturnal insects, never appearing, except by accident in the day, during which they remain under the shelter of forests, or concealed beneath the leaves of shrubs and grass. Others are truly day-fliers, committing their ravages by the light of the sun, and always present to our observation.

One of them appears about the middle of May. It eats the leaves of the pear-tree, and feeds also on those of the poplar and oak. It is a large insect, and was described by Linnaeus as the *SCARABEUS lanigerus*. The body is of a broad oval shape, and compressed or flattened; the head and thorax yellow, bronzed; the wing-cases pale yellow, punctate; the legs brownish yellow with shades of green; the body beneath green bronzed, and clothed with long yellow down. Length nearly one inch; breadth rather over half an inch. It is not constant in its appearance; in some seasons being found in great profusion, when, by shaking the young pear-trees, any number of them may be obtained.

Another large species attacks the grape-vine. It is the *SCARABEUS punctatus* of Linnaeus. The wing-cases are testaceous or brownish-yellow, with three distant black spots on each: the thorax darker, slightly bronzed, with a black spot each side; the head green-bronzed round the eyes; the body beneath and the legs deep green, bronzed. Length one inch, breadth over half an inch.

and is commonly called *muck-worm*; it differs, however, in some respects, from that of the MELOLONTA, and produces an insect generically distinct, which is described as the *Scarabaeus relictus*, by Mr Say.

A small species also attacks the vine; it is closely allied to the *M. ritis* of France; but, fortunately its ravages are not so extensive as those of the latter. It is the *M. varians* of Fabricius: is of a broad-oval shape, and the elytra testaceous; the central part of the thorax, the head around the eyes, the body beneath, and the legs blackish green, and bronzed, in the male; in the female these parts are of a pale brown colour.—Length of the male seven twentieths, breadth one fifth of an inch. Length of female two fifths, breadth five twentieths of an inch. It feeds on the cultivated and wild grape vine, and also on the smutch.—(To be concluded next week.)

BLIGHTED OATS.

Through the whole season till within a few days, the fields have promised a rich harvest of oats. But the last week has changed the face of things in this particular. Nearly all the Oats in this town and vicinity are said to be so blighted that they are scarcely worth harvesting. How extensive this failure of the crops may be is uncertain, but persons from several different towns have all concurred in the same tale, that their own fields of oats would be mowed and the stalks given unthreshed to the cattle. Our own observation has discovered acres of this grain, where ten days ago the stalk had attained nearly four feet in height and indicated a great burden, but in which now the stalks have lost their erect position, have crinkled down as it is called, in all directions as if unable to sustain their own weight. This shrivelling is a sure indication of blight. What can have been the state of the atmosphere to destroy the crop of oats, while all other grains are good, we know not, but the fact is beyond dispute. Had this blight been perceived while the stalk was yet green, it might have been mowed and converted into the best of fodder; so that the loss would have been much less. But as it was, the grain had begun to ripen, and the stalk turned yellow, before the appearances of blight were much noticed.

Concord Gazette of July 28.

From the National Intelligencer.

CULTIVATION OF SILK.

The culture of silk seems likely to be seriously entered into in this country: practical men in different parts of the Union having taken the experiment in hand. Amongst these is Mr Joshua Peirce, whose nursery and farm on the banks of the Rock creek are at the distance of a short but romantic ride from this city and Georgetown.—From him we have received the following letter, which shows that he is liberally disposed, not only to acquire information, but to impart it for the benefit of others.

Linnaean Hill, near Washington, }
June 7th, 1827. }

Messrs Gales & Seaton—Having engaged in the raising of Silk Worms with a view of making an experiment as to the practicability of making it a lucrative business, and of introducing them into this section of our country, I have now on hand about eight or ten thousand which have just commenced spinning, and, as a number of my acquaintances have expressed a wish to see them, you will much oblige me by giving notice in your paper, that they will be exhibited gratis for the present and next week, Sunday excepted. All persons desirous of seeing them are invited to call

at my residence at Linnaean Hill. As it is a subject that has of late excited much attention, some account of the silk worm, its history, management &c. and the cultivation of the mulberry tree, will no doubt be read with much interest by many of your subscribers. I send you McMahon's gardening, which contains quite an interesting article on the subject, and beg leave to suggest to you the propriety of inserting it in your paper.

Yours, with much respect,

JOSHUA PEIRCE.

We have pleasure in availing ourselves of Mr Peirce's suggestion, by copying the following from McMahon's Gardener's Calendar:

About the year of Christ 551, two Persian monks, employed as missionaries in some of the christian churches established in India, penetrated into the country of Seres or China. There they observed the labours of the silk worm, and became acquainted with the art of working up its productions into a variety of elegant fabrics.—They explained to the Greek Emperor at Constantinople these mysteries, hitherto unknown, or very imperfectly understood in Europe; and undertook to bring to the capital a sufficient number of those wonderful insects. This they accomplished, by conveying the eggs of the silk worm in a hollow cane. They were hatched, and afterwards fed with the leaves of a wild mulberry tree, and multiplied and worked in the same manner as in those climates where they first became the objects of human attention and care. Vast numbers of these insects were soon reared in different parts of Greece, particularly in the Peloponnesus. Sicily afterwards undertook to breed silk worms, with equal success, and was imitated, from time to time, in several towns of Italy. In all these places, extensive manufactures were established, with silk of domestic production.

From the reign of Justinian, it was mostly in Greece, and some of the adjacent islands, that silk worms were reared. Soon after the conquest of Constantinople by the Venetians, in 1204, they attempted the establishment of the silk manufacture in their dominions; and in a short time the silk fabrics of Venice vied with those of Greece and Sicily.

About the beginning of the fourteenth century, the Florentine manufactures of silk became very considerable. It was introduced much later into France; the manufacture of silk though considerably encouraged by Henry IV. not having been fully established there, till under Louis XIV. by Colbert.

It is an established and well known fact, that both the white and the black mulberry trees grow as well in almost every part of the United States as in any country on earth; and also that silk has been raised and manufactured into almost excellent fabric, under the direction of that great and venerable patriot, and friend of mankind, Dr Benjamin Franklin. That so useful a pursuit should be suffered to die away, in a country as well adapted for it as any in the universe, is as extraordinary as it is unfortunate and injurious to the real interest of the nation."

"Old Soaker." Professor Francis, in giving his testimony before the Court in New York during a recent trial there for murder, stated, that on opening the skull of the deceased, an effluvia came out resembling that which proceeds from old soaked rum casks

Abridged notices, from the Bulletin des Sciences, for the Hampshire Gazette.

RUSSIA.

The state of agriculture in Russia is very low. Grain is raised in sufficient quantities to supply the country with bread and whiskey, and to leave a large excess for exportation; yet by a comparison of the crop with the seed for several years, it appears that the produce is only 3 for 1. There are a few estates which yield 10 to 12 for 1, but there are so many that give only 2 for 1, that the average crop cannot be more than 3 for 1 of seed. The peasants have no lands of their own; they cultivate those of the crown or of their lords, and have no inducement to adopt any new modes of culture. They have but few wants, and are extremely ignorant and indolent. In Denmark rye produces 8, barley 10 to 14, and oats 10 for 1.

BEES.

In Livonia, the inhabitants make hollow places in the trees of the forest, to receive and cultivate bees. Some of them had hundreds, and even thousands of these bee-hives. Mr Butner, a Livonian clergyman says the air, at some distance from the ground, is better for the bees than that of the bee-houses which receive the exhalations of the earth. Where forests are not conveniently situated, he says it is advantageous to place the hives upon trees standing alone, at 12 or 15 feet above the ground.

HAIL.

Storms of hail are frequent and destructive in the southern parts of Europe, and the subject of protecting the crops from their ravages by paragreles, or hail-rods, has excited much attention and discussion in France, Italy, Switzerland, &c. The Bulletin for March, 1827, notices 23 publications, (some of more than 300 pages) upon the efficacy of these rods. Many fields furnished with paragreles have been preserved from the hail, while those in the vicinity, which were not so armed, have been ravaged. In some places, however, the hail-poles have not afforded effectual protection, and these failures have furnished arguments for those who oppose the system.

Paragreles are poles set in the fields, around which are wound ropes of straw, iron-wire, or other conductors of electricity. It is believed in France that electricity is an important agent in the formation of hail, and that this formation may be prevented by drawing the electric fluid from the clouds, by the aid of elevated metallic points.

SHEEP.

The English have had more regard to the form than to the fleeces of their sheep, and most of the 44 millions in that country are of the long-wooled large breeds. Fine wool for the manufacturers is imported from Saxony and Spain. The Saxons have given their attention to the fleeces, which they have brought to so great perfection that Spain possesses no flock that can be compared with some of those in Saxony. Sheep of the Saxon race are pretty numerous in the neighbouring countries of Silesia, Moravia, &c. In France there are but few flocks of pure merino blood. The French import great quantities of fine wool from Spain and Saxony, and they are now making efforts to introduce the Saxon race of sheep into France. Some of the French farmers have purchased sheep of the English long-wooled races,

and are attempting to acclimatize them in France. This long wool is in demand for the manufacture of smooth stuffs, as bombazets, &c. It is admitted that the English sheep eat twice as much as the merinos.

M. L. de Chateauxvieux says the merino sheep are so multiplied in Europe that there must necessarily be a reduction in the price of their wool. He thinks the price of the superfine wool from the Saxon merinos will continue to maintain a high price, because there are but few persons who will bestow that care and attention on their flocks, which these small and delicate sheep require.—He expresses an opinion that the Saxony sheep come from the race of Segovia in Spain, and that most of the other merinos in Europe proceed from the race of Leon, which is larger and more vigorous, but less fine.

Domestic Economy.

(BY THE EDITOR.)

Remedy for a Sore Throat.—We are informed by a person, who has experienced its good effects, that the essence of tar is a remedy for that affection of the throat, which often times terminates in ulcers, and sometimes proves fatal. The essence of tar may be had of apothecaries, and the mode of administering is to drop a little on a lump of sugar, which is permitted to dissolve in the mouth and the solution swallowed. It should be taken, he says, as soon as any symptoms of the complaint are felt, in small portions at a time, and repeated till the pain is mitigated, and the patient convalescent. The essence of tar we should suppose would produce effects on the human system similar to those produced by spirits of turpentine; and should recommend caution in its use, without advice from a regular physician.

Cod-fish.—Dun, or dried cod-fish ought not to be boiled to have it tender; it operates as on an egg, an oyster, or a clam,—the more you boil it, the harder it grows. Let it simmer on or near the fire, in a kettle, two or three hours, according as the fish is hard, and then change the water; and, before dishing, put this up to near boiling heat, but not higher. This management does not draw out, but revives the glutinous, and enlivens the nutritious substance in them, and leaves the fish tender and nutritious.

Ants.—When you find ants in quantities near home, pour hot water on them. The farmer when he manures his land, if he uses ashes, lime or salt sand, will not be troubled with those insects. Dr Rees' Cyclopaedia recommends boiling rain water with black soap and sulphur, and saturating the ground with it, which is infested with those insects.

Bells.—The nearer bells are hung to the ground, other things being equal, the further they can be heard. Dr Franklin has stated that some years ago the inhabitants of Philadelphia had a new bell imported from England, and in order to judge of the sound the bell was raised on a triangle in the great street of that city, and struck, as it happened on a market day; when the people coming to market were surprised on hearing the sound of a bell at a greater distance from the city than they had ever heard any bell before. This circumstance excited the attention of the curious; and it was discovered that the sound of the bell when

struck in the street, reached nearly double the distance it did when raised in the steeple.

Ink.—Nutmegs, in powder 4 ounces, Logwood 2 ounces. These are to be boiled for an hour in six pounds, (three quarts) of water, or until one half is evaporated. It is then percolated through a hair sieve, and to the liquid are added, copperas 2 ounces, gum Arabic half an ounce, Blue Vitriol half an ounce, Sugar Candy half an ounce.—It should be sufficiently warmed to dissolve these ingredients. It is then to be well stirred, and suffered to stand 24 hours. It is then poured from the sediment, and should be preserved in well stopped glass or stone jars.

It is fit for immediate use. This composition was the formation of Mr Ribancourt. It is unquestionably the best writing ink in use. Dr. Cox of Philadelphia says he has tried a great variety of recipes for the formation of ink, and has found none equal to this.

Sore Throat.—Let the throat be steamed with hot water, in which hops are infused, and apply the hops after having been scalded for some time externally to the diseased part of the throat.

Wen.—Anointing the afflicted part with rattlesnake's oil is said to be of great service.

Dairy Secret.—Have ready two pans in boiling water; and on the new milk's coming to the dairy take the hot pans out of the water, put the milk into one of them, and cover it with the other.—This will occasion great augmentation in the thickness and quality of the cream.

Wen in Cattle.—Rub the part affected with an Indigo bag, which has been some time in use in a dye-pot.

MAGNOLIA.

Near Fish creek, in Virginia, ten or twelve miles from Ohio, there is a grove of the lofty magnolia, and in the season of flowering, they fill the wilderness with delicious fragrance for several miles round. The leaves are more than three feet in length and of a proportionate width. There are no other trees of the kind within 500 miles. It has been stated, that the magnolias in Florida, have been smelt the distance of 60 miles.

A new three story brick building fell down in Robinson-street, New York, on the 27th inst. while the workmen were slating the roof. One person was killed, and five others hurt, three very badly, one of whom has since died. The wall next to a wooden building was eight inches thick; and that adjoining another brick building, was four inches thick. The bricks appeared perfectly clean, and the mortar crumbled between the fingers like ashes.

Footstool being at table next to a gentleman who helped himself to a very large slice of bread, after he had eaten a mouthful or two, Footstool took up his bread, and cut a piece off.—“Sir,” said the gentleman, “that is my bread.”—“I beg a thousand pardons, sir,” said Footstool, “I protest I took it to be the loaf.”

The Quebec Gazette states that much sickness prevails amongst the emigrants from Great Britain, which proves fatal to many.

From the N. Y. Evening Post.

GRAPE VINES.

*Horticultural Garden,
Brooklyn, July 21, 1827.*

SIR—I take this opportunity to inform my friends and the public, to whom I announced with what perfect safety the vines producing table grapes, imported by me from the north of France, had sustained, without any covering, the intense cold of the last winter, that they are the kinds which I now offer for sale by subscription. The different kinds of vines for vineyards from the north of France bore the winter equally well.

I deem it necessary also to inform the public that the experiment I tried at the same time upon vines from the south of France, has resulted in a total disappointment. They have all perished, and I cannot show a single plant of those that were left without covering. I attribute this ill success to their vegetating later in the autumn, and to their coming from a country favored by nature with an extraordinary mildness of climate. The vessels containing the sap in those vines are more dilated, whereas the sap vessels in the plants from the north are more compressed. It is the opinion of Dr Pascalis, who is a native of the south of France, that this observation applies more particularly to exotic grape vines, and that the plants should be chosen from a climate and temperature as similar as possible to those of the country to which they are to be transplanted. Besides, the vines from the south being more early in vegetation, are more liable to be affected by sudden changes from cold to heat, and from heat to cold, so prevalent in this climate in spring.

I warrant my vines to grow, not only by assertion but by proof, and that they are of the genuine kinds, having an establishment of which I must maintain the reputation. I undertake also to designate the different kinds most congenial to each soil and situation. The established price for vineyard vines is 25 cents by the quantity.

Those persons who have followed my instructions are perfectly satisfied with the success of the planting and growth of their vineyards.

Mr B. has formed a vineyard at his country seat on Long Island. The plants were not furnished by me. He has told me himself that he had lost 1000 of the 8000 plants that he had set in the ground this spring, which is an enormous loss considering the price of labour, the delay, the discouragement and the expense to which it subjects the proprietor in replacing them. This disappointment has happened to him although the spring has been uncommonly favourable by a succession of warm rains and genial heats, which are the most powerful promoters of vegetation. It is therefore astonishing he has lost so many: for such favourable springs cannot be often expected in this climate.

Respectfully yours,

ANDREW PARMENTIER.

A Bobinet factory has been discontinued at Ipswich. The British having improved so much in the machinery, as to be able to manufacture with greater rapidity, and to undersell the Americans in our market, though the domestic article is the best. The factory discontinued, employed 300 young ladies in Lace Work. A new net factory is however, to be established at Ipswich. The Newport School purchases its bobinet.

CROPS.

In this neighborhood, the crops were never more bountiful than the present season. The rye harvest is begun, and so stout is the grain, that a clip or two will fill the hand of the reaper. The shocks stand thicker than we have sometimes seen sheaves in other years, and it is, the farmers say, narrow dodging to drive between them with the cart. The grass is so heavy, that it requires a strong arm to carry the scythe through the swaith, which, when turned out, looks like a whole winnow of itself. In many fields, unable to support its own weight, it has long since lain down; and when cut there is hardly room on the ground to dry it. The corn, which was rather puny before part of the season, has of late become stout and strong; and if you had the patience to watch it, you might see it grow. Every thing looks smiling—except that you now and then see a cloud on the brow of the farmer, caused by dull hay weather, or the scarcity of help to secure his crops—and there is reason for every body to smile, the manufacturer, the mechanic, the merchant, and the professional man, as well as the cultivator of the soil; for the former, although they are growers neither of corn nor beef, are nevertheless people of *taste*, and love good eating as well as the agriculturalist. [Berkshire American.]

FISH.

Dr. Franklin having observed in New England, that the herrings ascended from the sea into one river of that country, while a single individual was never seen in another river, separated from the former by a narrow tongue of land, and which communicated also with the sea, this philosopher took the leaves of some plants on which the herrings had deposited their eggs, already fecundated, and conveyed them to the river which was deprived of the annual visit of these fish. The success of this experiment surpassed his expectation; the eggs were completely productive, and the following year the river was filled with a numerous shoal of herrings, which, since that time, have continued to frequent it. Dr. Mitchell of New York, informs us that he transported two dozen and ten yellow perch from Rochonkoma pond, in Suffolk county, Long-Island, to Success pond in the town of North-Hampton, a distance of 40 miles. In two years these few fishes multiplied so fast, that they might be caught with a hook in any part of the water, which is about a mile in circumference! "Planting" oysters, as it is termed, is a common practice.

When fish are kept in large pools or ponds boiled malt, or fresh grains, are proper food: thus, carp may be reared and fed like capons, and perch will also prosper. If reared in a stew, any sort of corn, or leguminous fruit boiled, especially peas and malt coarsely ground, are equally fattening. [Domestic Encyclopedia.]

Bridgetown, N. J. "STEAM BOAT." A cow, so called, (whose power we should call a 100 horse,) in the possession of Dr. Wm. Elmer, of that place, produced last week, a male and a female calf, at one birth, averaging 80 pounds each—this is the second time in succession she has brought forth twins, and each pair averaging 160 pounds at a birth. She is now the mother of five living calves, the oldest but twenty-five months old, and if killed and dressed now, they would weigh 500 lbs.

Mass. Journal

FOUNDERED.

A disease in the feet, to which horses are subject. It is occasioned by hard riding, severe labour, great heats, sudden colds, &c. that inflame the blood, and, as the farriers express, it, *melt the grease*, which descends into the feet; where it settles and causes such a numbness and pricking in the hoof, as in some instances to render the animal affected unable to stand.

The general methods of removing this disorder are, first, bleeding, which operation, if opportunely performed, is calculated to afford immediate relief. The rapid and irregular circulation of the blood is then to be diminished, by giving the horse cooling salts internally, clysters, an opening diet, and plenty of diluting liquor four or five times every day, together with emollient poultices; which ought to be applied warm round the hoofs, in order to soften them, and to promote a free and equal perspiration.

But the sole or frog of the foot affected, should on no pretence be pared to that excess, which is too frequently done by ignorant farriers. It will be sufficient to clear away the hardened surface of the sole, that the poulitice may properly open the pores. All greasy and oily applications should likewise be avoided, being all calculated to accelerate the cure.

[This disease is a kind of gout, produced by permitting the animal to eat or drink heartily while hot; or by violent exercise on a full stomach. The cure is bleeding, purging and rest. Take off the shoes.—T. C.]

[Domestic Encyclopedia.]

IMPROVEMENT IN THE ARTS.

We observe, in the Auction Hall of the Exchange, a large street lamp, or lantern, manufactured at the Jersey Glass Works, in a manner different from that of any article of the kind heretofore produced in this country. Its peculiar merit consists in being made of *stained and marbled glass*, by an artist from England; who we should imagine could not fail to find encouragement in his line in the United States. The colouring and ornamenting of the material (common window-glass) is beautifully done, and may be adapted to the greatest variety of fashionable and useful purposes. The dyeing or staining has been witnessed before, in some specimens from the same hand, but nothing in its present state of finish, though frequent in Europe, has been seen before in America. From what we perceive of this improvement in the art, we may rationally expect the attention of builders and directors of churches, and other public edifices, to be attracted towards it—so peculiarly adapted to the solemn and magnificent in architectural beauty and grandeur, as well as calculated for the more humble but general and practical accommodation of the fanciful and curious in the minor branches of commerce and trade.

MACHINE FOR RAISING WATER.

G. Bradley of Newton, Con. has sent us a partial account of a self acting machine, invented by them for raising water. There is a brook a little distance from their dwelling house, the bed of which is 18 feet lower than the sill of their house. The water of their well would not answer to wash with, and they were compelled to resort to the brook, until their necessities became the mother of invention to them. They have invented a sim-

ple but durable machine, at a cost not exceeding ten dollars, which raises water to the amount of 140 gallons per day. There is no wheel or pump attached to the machine. They are fully satisfied from this experiment, that water may be raised on the same principle to the height of 50 feet or more, in large quantities, for the purpose of carrying water wheels of every power—supplying distilleries, tan-yards, and farms on which there is no living stream, &c. They have not given a very satisfactory description of the machinery, but say "a fall of 3 feet is necessary in raising the water 10 feet, and in that proportion for a greater or less distance." Suppose a person has a spring near his house, he has only to set up a penstock, throw the water into the top of it, and then put in a lead pipe at the bottom of the penstock, and take it to your house." They will give further information to those who will write them, (post paid.)

N. H. Register.

CANADIAN, OR TREE ONION.

This is remarkable for producing a bulb or onion at the top of the stalk.

The stem of this plant is naked and round; and the leaves are flat and narrow.

These onions are well deserving of attention, both as objects of curiosity, from producing an onion upon the stalk, and also for their use. When pickled they are generally thought superior in flavour to the common onion.

They were originally imported from Canada; are perennial, and are propagated by planting the bulbs in the spring or autumn. Either the bulbs of the root or those on the stalk will grow.

TO FATTEN FOWL.

At this season of the year, the most economical method of fattening chickens is to give them curdled milk. The practice, as far as we have observed, is to shut them up in some cool place, and confine them to sour curdled milk, with a little meal or corn two or three times a week. On this food they soon become fat. [N. York pap.]

GINGER WINE.

The following recipe for making a pleasant ginger wine, is recommended from experience.

To 20 gallons of water, add 80 lbs. honey, or 70 lbs. sugar, the former in preference; boil and skim as the feculent matter rises; put the mixture into an open head, and add half an ounce of ginger coarsely ground or bruised, to every gallon of the mixture; and when cooled, ferment and proceed as in elder wine, adding to every 10 gallons, when bunging close, one fourth of brandy; and if the flavour of the orange is required, proceed as in currant wine.

BURNING-GLASSES.

These instruments are undoubtedly of very ancient origin; the most celebrated were those of Archimedes and Proclus; by the former of which the fleet of Marcellus was destroyed at the distance of a bow-shot. In modern times, there have been several inventions of this kind, remarkable for their large diameter and powerful effects; the principal of which are those of Magine, of Septala, Scitalla, and Buffon; the latter of whom made one that consisted of 400 mirrors, which reflected all their rays to one point, and with this he could melt lead and tin at the distance of 140 feet.

Sir Isaac Newton presented a burning-glass to the Royal Society, which consisted of seven con-

cave glasses, so placed that all their foci join in one physical point. This instrument vitrifies brick or tile in one second, and melts gold in half a minute.

New Well.—Mr. Disbrow has been employed for some time in boring a well for the Corporation in Jacob-street; and has lately stopped on striking an abundant spring, at the depth of 125 feet. The water is thought to have peculiar properties, and has been submitted to a hasty analysis, which gives a large quantity of muriate of Soda, and a little of the sulphates of magnesia and soda, muriate of magnesia, and carbonates of magnesia, lime and iron. 1. Shows little evidence of uncombined gas; and the only decided taste it has is something like that of tar, the cause of which we believe has not been ascertained. Many thousands persons have already been to the spot to taste the water.—V. F. paper.

Cure of Intemperance.—A few doses of Dr. Chambers' Medicine for intemperance have been administered in this village to individuals who are in the almost constant practice of indulging in the vile habit of drunkenness. The effect is that a complete reformation has taken place in their tastes, so that instead of hauntering after the hourly dram, the very smell of spirituous liquor has become offensive. We hope it will prove lasting. *Herkimer American.*

There is a very large manufactory of mill saws in Philadelphia, at which it is said they are made one third cheaper than they can be imported, and so much better that persons, who know the value of an American saw would give one third more for it.

The price of poultry in London at present is enormously high. Young fowls were selling at \$2.00 each, and ducks were equally dear. Contrast this with the price of poultry in this country.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, AUGUST 3, 1827.

STUBBLE.

There are four modes of managing stubble land, viz. 1. To plough in the stubble as soon as possible after harvest. 2. To cut it up close with a scythe and cart it into the barn yard for manure. 3. Burn it on the land without cutting. 4. Let it remain till it wastes away, and is decomposed by the course which nature adopts in restoring vegetable and animal substances to their primitive elements. We will speak of each in its turn.

1. When your land is light and sandy, the stubble of wheat and rye may be ploughed into the soil to enrich it. This, together with the weeds will be equal to a moderate portion of manure.—With ploughs of the common kind, however, the ploughing in of stubble is difficult and disagreeable. The plough is apt to choke up, so that it is more than a man can well do to keep it clear.—Ploughs for this work should be much deeper built than the common ones. And this work might be greatly facilitated, if a heavy roller were passed over the stubble, to lay it flat to the ground before ploughing. When this is doing great care should be taken to pass the roller the same way that the plough is to go. By means of this, the coulters will but seldom be clogged with the stubble. If this rolling be neglected, a small roller annexed

to the fore end of the plough beam, in the place of a foot, or even a foot itself, will greatly help to clear the way for the coulters. But the most effectual mode for preventing a plough from clogging is to use what is called a *plough cleaner*, invented by Mr. Joseph Kersey of Pennsylvania, of which we gave a drawing and description in the *New England Farmer*, vol. i. page 107. It consists of a piece of timber, pinned to the plough beam just before the coulters, with a staff or handle attached to its upper end, so placed as to come within reach of the ploughman, who by pulling the handle, turns the piece of timber on the pin, and causes the lower end to scrape the ground just before the coulters, and thus remove stubble, weeds, and other obstacles to smooth ploughing.

2. The celebrated Arthur Young advises the cutting wheat and rye stubbles, and raking into heaps for carting home to the farm yard for litter; and says: "This is a business strangely neglected in most parts of the kingdom; but is nevertheless of great importance; the stubble left on the land is not of much advantage as a manure; it prevents the plough from turning in the land with neatness, and a crop does not succeed soon enough to feed on it; but carted into the farm yard it becomes an excellent manure. Any sort of litter there is valuable, and serves for the cattle treading into the dung. In those parts of the kingdom where this use of stubble is common, the price for cutting and raking into heaps is from 2s. 6d. to 2s. 6d. per acre (1798); a very small expense compared with the great advantages that undoubtedly result from it."

3. The mode of burning stubble on the ground has been heretofore detailed in the *New England Farmer*, vol. i. page 413, and vol. iv. page 6. It is highly recommended, and in many cases is, doubtless the most eligible practice.

4. Letting stubble remain to waste and decompose on the field can only be advisable when there is a good bite of grass growing among the stubble which you intend shall serve as fall feed for your cattle. See further on this subject, *N. E. Farmer*, vol. iv. pages 5, 6.

HARVESTING PEASE.

Garden pease are harvested by picking them off as they ripen; but field pease must of course be harvested all at once. They should be mown before they begin to shell out. Those among them which are unripe, will ripen, or at least become dry, after they are cut or pulled up; and such pease, when well dried are not unfit for the table, though their colour renders them less valuable in market. Mr. Young says "The stalks and leaves of pease being very succulent, they should be taken good care of in wet weather; the tufts, called wads, or heaps, should be turned or they will receive damage. The straw, if well harvested, is very good fodder for all sorts of cattle and for sheep; but if it receives much wet, or if the heaps are not turned, it can be used only to litter the farm yard with."

London observes that "in the early crops, the haulm is booked up into loose open heaps, which, as soon as they are perfectly dry, are removed from the ground and put into stacks for the purpose of being converted to the food of animals, on which they are said to thrive nearly as well as on hay. When intended for food for horses, the best method would seem to be that of having them cut into chaff and mixed with other food."

CATTLE AND SHEEP IN PASTURES.

Careful graziers make it a rule, however extensive their farms may be, to ride round and see every beast in every enclosure at least once a day. Plagued with flies, suffering from thirst or want of food they are very apt to break through fences, and commit trespasses, which at this season are more than commonly injurious on account of the state of the crops.

FOLDING SHEEP.

Mr Arthur Young says, "in respect to folding sheep, a very great change has taken place on inclosed farms in the practice of the best farmers, especially in Norfolk. They are now fully convinced, that it is an unprofitable practice, except where the openness of downs and common fields renders it necessary for the purpose of confinement. The number of sheep that may be kept on a farm, without folding, is much greater than can be supported with it. This is a very essential point. There is a deduction from the farmer's profit, in the injury done by folding, to both ewe and lamb, which has been estimated, by experienced judges, at from 2s. 6d. to 4s. per ewe; so that a farmer should consider well before he adopts a practice which, from a multitude of observations is pronounced unprofitable. Mr BAKEWELL used to call it robbing Peter to pay Paul.

"I am perfectly persuaded, that it would have been impossible for me to have kept on the same land, nearly such a stock as I have done, if in one parcel with folding. I do not conceive that the fields would have carried three-fourths, so managed. When sheep are kept in numerous parcels it is not only driving to and from fold that affects them, but they are, in fact, driving about in a sort of march all day long, when the strongest have too great an advantage, and the flock divides into the head and tail of it, by which means one part of them must trample the food to be eaten by another. All these points are the very reverse of their remaining perfectly quiet in small parcels.

"I attended, through the course of a summer, many gentlemen over my fields, with a view to examine whether the sheep had seemed to have rested only on spots, to the too great tannering of such; or on the contrary, to have distributed themselves more equally; and it was a pleasure to find, that they seemed generally to have spread in every part, if not equally, at least nearly so.—The improved countenance of several old lays fed in the same manner convinced me as well as my bailiff, that the ground had unquestionably been improved considerably.

Folding in littered yards is described by Dickson (Complete Farmer, art. Sheep) as combining all the advantages of folding on arable lands without any of its disadvantages. By this practice the sheep are confined in a yard well and regularly littered with straw, stubble or fern; by which means the flock is said to be kept warm and neatly in a bad season, and at the time a surprising quantity of manure accumulated. A great improvement on this method, it is said, would be, giving the sheep all their food (except their pasture) in such yard.

But even this method of folding sheep, though warmly recommended by some celebrated English agriculturists, is condemned by others. The writer of the art. *Agriculture* in the *Supplement to the British Encyclopædia* says "that such a method may be advantageous in particular cases, it would

be rash to deny; but generally it is not advisable either on account of the sheep, or any alleged advantage from the manure they make."

We believe that folding, or crowding them together in close pens may be very injurious to their health; and doubt whether, in general, any benefit derived from their manure can compensate for forcing them in large flocks into comparatively small yards, pens, or enclosures, especially in warm weather. Still, in our climate, they sometimes require, or at least are the better, for occasional shelter. Sheep are so well clothed by nature that they rarely if ever suffer from cold, provided they are kept dry. But foul air and moisture are very injurious to this animal. The opinion of Mr Lawrence appears to us to be correct, who says, "To every farm yard ought to be attached a sheep-yard or home fold, completely fenced in, and either totally or in sufficient part surrounded with sheds composed of any cheap material. The sheds to be closed up, having windows for the admission of air, to as great an extent as may be judged necessary, the remaining space to be left open. The whole to be divided into pens for the needful separation of the flock. The bottom to be littered, and I think it is better for the health of the sheep, that their manure should be frequently cleared away, rather than suffered to remain a whole season as is usually practised. On extensive sheep farms, there should be as many of these covered folds, in the most convenient situations, as are necessary in order to completely secure the whole flock. The most convenient part of these folds or enclosures, must ever be reserved for the first ewes expected to lamb; and thither they must, after selection, be driven and confined in good time; and so on in succession, by which a numerous train of risks and mischiefs may be avoided. In feeding, the sheep should be divided into lots, sufficiently small, and properly assorted, as to strength and condition. In grazing abroad, upon enclosures, the practice of division into small flocks of strong and weak, is excellent, and productive of numerous advantages unattainable in the old system.

A very strong argument in favour of usually permitting sheep to feed at large in pastures, as well as increasing the numbers of this very useful animal, may be found in the benefit, which the soil receives from their being pastured upon it.—Mr Young observes (Annals of Agriculture, vol. xxvii.) that it is the opinion of many eminent farmers that nothing recruits poor soils so much as heartily feeding them with sheep for some years, provided the sheep are not folded away from the land, and he himself has practiced upon this principle with success. The effects of keeping a very full stock of sheep upon the land is that they prevent any seed stems from rising to exhaust the soil, and thereby give to the grass plants, which they constantly keep pared down and bare by their close bites, a habit of matting, and spreading their roots, so as to form a firm turf, and a close growth of delicate grasses. This, like every other valuable practice any, no doubt, be over-done, particularly during a long, hot, and dry summer: because, such a season, if the land is much overstocked with sheep, they are under the necessity of biting so close, that they are apt to destroy the roots of the grass. In other respects, however, there is no doubt, that both by the mode of eating, and by their dung, grass lands are greatly meliorated by being fully stocked with these animals.

As there are very few plants which they do not eat when young, they have a tendency to clear pasture land of almost all noxious weeds, and encourage the exclusive production of grass."

Folding sheep on land for the purpose of preparing a particular spot for turnips is a practice not without its advantages; and formerly a turnip yard, in which sheep or neat cattle had been enclosed for a certain number of nights, was an appendage to almost every farm. But it may well be doubted whether sheep are not more injured by being crowded together in yards, in a season of the year, when, if left to themselves, they would feed principally in the night, than the land or its owner is benefited by the practice of folding.—Turnips may, we think, be raised with more economy, as a second crop, by ploughing and preparing stubble or grass land, than by the old method.—But though sheep should rarely if ever be folded, we think they should as rarely be destitute of sheds as other buildings, in which they may obtain shelter or remain in the open air at their option.—Sheep, as well as animals in general, are the best judges of their own wants, and seldom make a wrong choice when allowed the liberty of choosing.

FOOD FOR CATTLE.

We know of no person in New England, who has been so successful in that branch of rural economy which consists in the breeding and rearing of neat cattle as Col. SAMUEL JAMES, jr. of Charlestown, Ms. and we think that he has merited the thanks of the agricultural community for his liberality and public spirit, in communicating the mode by which he has fed his fine stock, with probably less than half the expense which would have been incurred in the common methods of treating the animals. The gentleman who furnished us with the receipt has also had us under great obligations, and will please to accept our acknowledgements for the favor.

The following has been used by Col. JAMES with the best success for feeding cattle,

Take Rata бага, cut fine,	2 bushels
Wheat bran	1 bushel
Powdered oil cake	$\frac{1}{2}$ bushel
English hay, barley straw,	
and salt hay, cut, of each,	7 bushels.
Water	10 gallons.

Let them be perfectly mixed. Give a bushel of the mixture to a cow of the common size every night and morning, and proportionably to greater or smaller animals.

Whortleberry Pudding.—We are assured by a friend to improvement in domestic economy, that the whortleberry will make a very excellent pudding, when properly mixed with flour and water, and a little salt for seasoning, without the addition of milk, butter, eggs, &c. according to usual mode of making puddings. The whortleberry adds a richness to the other ingredients which supercedes the necessity of other and more expensive materials.

How to subdue the Flag, or Cat's Tail Weed.—There are few weeds which infest our mowing grounds which are more pestiferous, or are generally considered more difficult to subdue than the flag, by some called cat's tail, so common in swamps and low meadows. A gentleman assures us however, that by cutting the plants as close to the ground as possible in June, in warm and dry

weather they may be subdued. The grass among which they grow, and which may be cut with them will soon start again, but the flags will be quite destroyed root as well as top.

Pine Apple Cheeses.—The Litchfield Post says Mr Timothy Collins of Goshen, (Con.) makes 12 pine apple cheeses daily, weighing 7 pounds each, which will sell for from 12 to 20 cents per pound. These cheeses are called *pine apple cheeses*, from the great resemblance they bear to that fruit.—The processes of pressing and drying are novel and interesting. Cheeses of the same kind are made at other dairies in Goshen. They possess no advantage over the common kind, except that of keeping longer in warm climates.—*Hamp. Gaz.*

For 11 years past, the average proportion of deaths in Boston has been one in 41; New-York one in 38; Baltimore one in 35; Philadelphia one in 32. In New-York one in 5 of the deaths are by consumption; in Boston one in 5.—*Ibid.*

Defeat and Butchery of the Greeks.—The last Paris papers contain melancholy tidings concerning the poor Greeks—two thousand five hundred of whom had been put to the sword! The Commercial Advertiser says—

“The Greeks, it seems, had assembled 10,000 men for the relief of Athens. Four thousand had marched in the direction of Asonato, at the north of the Pyreus, for the purpose of attacking the Turks in the rear, who occupied a fortified position among the olive groves, while the other troops were to attack them in front. On the 4th, Kariakaki commenced the attack on the Turks and was killed, with 300 of his men. On the 6th an engagement took place between the Turks and those Greeks who had effected a landing from the fleet. Two thousand men, sent by Redschid Pacha, attacked them, and the defeat and slaughter of the Greeks was horrid. Out of 22 Philhellenists, 18 were killed. The total loss of the Greeks in killed was 2,500 men. Lord Cochrane with difficulty succeeded in taking on board the fleet the remnant of the Army, and General Church in rallying his troops, narrowly escaped being made prisoner. The expedition is said to have been well planned, and the defeat is attributed to the superiority of the Turkish cavalry. The Greeks, however, tho’ defeated with great loss, still continued their efforts for the preservation of Athens. At the receipt of the last intelligence, General Church still kept possession of the heights of Phalermo with 3000 men, and on the 16th of May, that is ten days after the defeat, the Acropolis held out. On the 13th, Lord Cochrane was scouring the Archipelago in search of reinforcements.

The garrison of St. Spiridion, manned by a few hundred Turks, had been taken by the Greeks, who massacred their infidel foes. This movement so incensed Redschid Pacha, that he caused all the Greeks in his power to be beheaded. On the 25th of April, it is stated, upwards of 2000 Greek women and children were massacred!

A fine corvette, of 18 guns, built at Marseilles for the Pacha of Egypt, was said to have been captured by a Greek brig.

Nearly all the national vessels at Toulon, France were preparing for sea with the greatest expedition. Various rumours were afloat on the subject

At Ballston the celebration of the 4th was peculiarly interesting and appropriate. The revolutionary veterans of the vicinity were assembled, and proceeded to the battle ground of Gates and Burgoyne. The different spots and positions distinguished by the most remarkable events and scenes of that memorable campaign, were visited and brought to the recollection of the spectators by the recitals of these living witnesses and actors of the day.

A new Catholic Church was opened at Opelousas, Louisiana on the 10th ult. About 1000 persons were present. The church is calculated to contain between 1 and 2000. This is a further proof of the growth of the country—which will be great and happy, if people will restrain their passions, and not suffer themselves to be excited to violence for imaginary or small evils.

The late Mr. Windham was at a country sessions, at which applications were made by six persons for licenses to preach. Out of the six, four differed in their mode of spelling “Minister of the Gospel,” and not one of them was correct.—Of the other two, one could read, but not write; but the other “preacher of the word” could neither read nor write. On admitting this fact, one of the magistrates asked, in amazement how he could “preach the word,” without the facility of some little reading? “Very well,” was the reply; “Mother can read, and I can ‘spound.’”—*Dublin Morning Register.*

The Haverhill Gazette states that two enterprising individuals of that town have purchased a new steam engine, and are now preparing a boat to run as a regular packet on the Merrimack, between Haverhill and Newburyport. The boat will probably be in readiness for passengers in all next month.

The Newburyport Herald states that the boats which have returned to that port from mackerel fishing have not landed fish enough to pay their outfits. The fish are said to be very scarce in the Bay this season.

Patterson, a manufacturing town in New Jersey, contains 6236 inhabitants. 1453 persons are employed in the factories, whose annual wages are 221,000 dollars.

A jury in England has returned a verdict of manslaughter against the Engineer of a steamboat for the bursting of the boiler, by which a person got scalded to death.

A Leap.—We hear that some rude, unfeeling boys, a few days since, took a Dog and threw him into the rapids of the Niagara river, just above the Falls, and that the poor animal, in despite of his exertions, was precipitated over the stupendous precipice: when, strange to record, the Dog was discovered in the tumbling flood, by the ferryman, pulling for the shore: upon reaching which he was found to have sustained only a slight injury on one of his legs. [Black Rock Gaz.]

A letter from an American gentleman in Paris, says that Mr Warden, former consul of the U. S. has met with a book, 100 years old, which contains a theory of the earth similar to that of captain Symmes.

It is reported that the venerable Charles Carroll, the only survivor of the Signers of the Declaration of Independence, has given \$70,000 towards the Maryland and Ohio Rail Road. The Rail Road Scrip is at 100 per cent advance.

A communication from Smithfield, R. I. will appear next week.

Wool.

On Thursday, the 23d of August, at the lower division of the hall over the new Market House, under the direction of the *New-England Society*, will be sold, a large assortment of American fleeces WOOL. Wool-growers and others, who wish to benefit by this favourable opportunity for disposing of their Wool, are informed, that we are prepared to receive it, any time previous to the 17th of August, at which time the catalogue will be closed. COOLIDGE, POOR & HEAD, Auctioneers Boston, July 27, 1857.

For sale at the Agricultural Warehouse, No. 52 North Market street, two of Pope’s improved hand or horse power Threshing Machines. Satisfactory proof of the utility and operation of this Machine may be had on application as above.

Yellow Locust Seed.—Turnip Seed, &c.

For sale at the New England Farmer office, a few lbs. Yellow Locust Seed, superior scarlet short top Radish, White Mulberry, 13 varieties of Turnip, Girkin or pickling Cucumber, &c. with a new assortment of ornamental flower seeds.

Subscribers to the *New England Farmer* are informed that they can have their volumes neatly half bound and lettered at 75 cents, which is as cheap as they can be done in this city—by sending them to this office. Subscribers who began after the last volume commenced can be supplied with the deficient numbers.

Miscellaneous.

The following beautiful Epitaph on the death of Mrs Hawksworth, was written by her husband Dr. Hawksworth, and is, we think, a model of this species of composition.

ON THE DEATH OF MRS HAWKSWORTH.

BY HER HUSBAND.

Whoe'er, like me, with boding anguish brings
His heart's whole treasure to fair Bristol's springs:
Whoe'er, like me, to sooth disease and pain,
Shall pour these salutary streams to vain;
Condemn'd like me to hear the faint reply,
To mark the flushing cheek, the sinking eye,
From the chill brow to wipe the damps of death,
And watch with dumb despair each shortening breath,
If chance direct him to this atless liee,
Let the sad mourner know, his pangs were mine.
Ordained to lose the partner of my breast,
Whose beauty warm'd me, and whose virtue blest;
Form'd every tie that bids the soul to prove
Her duty friendship, and that friendship, love;
But yet, remembering that the parting sigh
Ordained the just to slumber—not to die;
The falling tear I check'd and kiss'd the rod,
And not to earth resign'd her—not to God.

MONEY DIGGERS.

Digging for money hid in the earth is a very common thing, and in this state it is even considered an honourable and profitable employment.—

We could name, if we pleased, at least five hundred respectable men, who do, in the simplicity and sincerity of their hearts, verily believe that immense treasures lie concealed in the Green Mountains, many of whom have been industriously and perseveringly engaged in digging it up.—Some of them have succeeded even beyond their expectations. One gentleman in Parkstown, on the summit of the mountain, after digging with unyielding confidence and unabating diligence for ten or twelve years, found a sufficient quantity of money to build him a commodious house for his own convenience, and to fill it with comforts for the weary traveller. On stopping lately to refresh, we were delighted by the view of an anchor, on the sign, emblematical of his hope of success, while we left him industriously digging for more. Another gentleman on lake Champlain, we were credibly informed, has actually dug up the enormous sum of fifty thousand dollars! The incredulous and unbelieving may stare at this assertion, but it is nevertheless true: and we do not hesitate to declare our belief that digging for money is the most certain way for obtaining it.—Much, however, depends on the skilful use of the genuine mineral rod. *Don't dig too deep*, is an appropriate maxim with all those who are versed in the art. Wood's Iron Plough, skilfully guided, is sure to break the enchantment, and turn up the glittering dust in every furrow. Countless treasures yet remain in the earth. Speed the plough—ply the hoe—'twill all come to light.—*Montpelier, Vt. Watchman.*

A little world.—A few twigs, full of sap, were placed in a small quantity of water for several days, until a part of the sap became incorporated with the water. A drop of this water was put on the head of a large pin, and by the solar microscope it was found to contain more than 30,000 living creatures!—*Mathews on Sord.*

SPANISH PROVERBS.

Every body must live by his own labor.
It is better to be alone than in bad company.
A widow's child is generally spoiled by the love of his mother.
Guardians & administrators generally live well, but are frequently deficient in their accounts.
We must take pains, if we expect to get any thing.
He who has a wolf for his companion, must carry a dog under his cloak.
The devil lies in a covetous man's chest.
It is sound policy to suffer all extremities, rather than do a base action.
Many drops make a shower; light grains make a heavy purse.
Do not sign any writing which you have not read, nor drink any water which you have not seen.
He that sells and lies, shall find the lie left in his purse.
Old reckonings make new quarrels.
Short reckonings make long friends.
What we learn in our infancy remains forever.
A regular diet cures more people than physic.
Patience, application, and courage, overcome all difficulties.

Water drinkers are never drunk or never run in debt.
The first wife sweeps, the second is a lady.
There is no better looking-glass than an old friend.
Manure the earth well and work it, and you will obtain a good harvest.
The happiness of a wife, and the cultivation of a vine depend on the care of a man.
People who take out, and do not put in, soon find the bottom.
The best catch at dice is not to play.
Giving alms never empties the purse.
Children tell in the streets what they hear at home.
Not to see a workman is the loss of one's money.
He that has no bread to spare must not keep a dog.

Plough deep, and you will reap abundance of corn.
A secret between two is God's secret; a secret between three is every body's.
Love is shown by kind actions, and not by fair speeches.
It is better to go round the stream than drown in crossing.
The best work a mother can do, is to take care of her children.
Nothing great can be effected without trouble and labour.

Nantucket.—Perhaps there is not a community in the world which has grown up to the magnitude of the town of Nantucket under such singular and untoward circumstances. This island was settled in 1639. The first civilized inhabitant was *Thomas Macy*, who fled from the spirit of persecution, which would have inflicted its barbarous punishment upon him for protecting against the mandates of the puritans, a defenceless Quaker. It was then inhabited by Indians. The whites cleared the land and devoted themselves to agriculture, and it can hardly now be received with full credit, that such was the fertility of the soil, the first settlers were not only able to produce food enough for their own consumption, but that from

a place now importing the chief part even of the kitchen vegetables, quantities of pork were shipped from Boston. In 1690 the first whale was taken from the beach and a new direction given to the pursuits of the inhabitants. The right whale was a visitant of the coast in the spring. He could not but attract the attention of adventurers and daring men. On the Cape they had already commenced pursuing this game, and the people here became eager to share in the toil, the danger, and the profits of the pursuit. At the time above stated, one *Paddock* came to this place, and the business commenced from the south side of the island, on the broad Atlantic. On the beach, where the waves have rolled unnoticed by the whaler for almost a century, was all the activity and bustle consequent upon landing, in a single day, sometimes no less than eight fish. It is curious to see how these fish departed farther and farther from the coast, and how the fishing, in consequence, has expanded from the shores of this little spot to the North Atlantic ocean, in spite of obstructions which it seems strange were ever overcome.—*Nantucket Journal.*

"No Trust."—This should be the motto in every bar-room. If well observed, it would be for the advantage both of the landlord and the customer. The landlord would sell less, but get more money; the customer would drink less, work more, advance his own comfort and reputation, and the happiness of his family. A bar-room is the ruin of thousands. It affords so great a facility for a man to get rum when his pockets are empty, that he will take but little pains to fill them by industrious habits. Besides, the man who takes his frequent drams, his slings, his gall-bursters, his phlegm-cutters, his anti-fogmalies, his eleven-o'clocks and his four-o'clocks, is not aware what an enormous bill he is running up; and if he were required to launch the ready four pence for every glass, would often look twice at the money, before he allowed it to escape his fingers. [*Berkshire American.*]

Immortality.—Baurow, in presenting a poet to M. d'Hemery, addressed him, Sir, I present to you a person who will give you immortality; but you must give him something to live upon in the mean time.

At the Jersey Glass works near N. York, stained and marble glass is manufactured. Coloring and ornamenting the common window glass, is beautifully done.

Sorony Sheep.

On Friday the 24th August next, at 3 o'clock P. M. at Brighton near Boston, will be sold by public auction, a choice stock of about 100 Saxony Rams, just imported in the brig *Comet*, Capt. Mee, from Hamburg.

These sheep were selected from the purest blood in the kingdom, and will be found at least, equal in point of fineness of fibre and symmetry of form to any heretofore imported. The sale will be perfectly free and unlimited.

Samples of the wool from different parts of each animal may be seen at No. 36 Central street, or at the office of the auctioneers, at any time previous to the sale.

COOLIDGE, POOR & HEAD.

The FARMER is published every Friday, at \$3.00 per annum, or \$1.50 if paid in advance. Gentlemen who procure five responsible subscribers, are entitled to a sixth volume gratis.

HORTICULTURE.

DISEASE IN GRAPE VINES.

Mr FESSENDEN.—The enclosed letter, being a reply to one from me making inquiries respecting the cause of a disease which has this season attacked my grape vine, I send for publication, (being authorized by the writer,) presuming the information contained in it may be useful to those who are cultivating the vine in New England.—In order to give a better understanding of the letter, and with the view of eliciting further information on the subject from some of thy correspondents, I will briefly state the manner of attack, and the progress of the disease alluded to.

I received from Flushing, Long Island, in the spring of 1823, a grape vine of the celebrated sort called *Isabella Grape*, which grew finely, and produced in 1826 about three bushels of grapes.—About the time of its blossoming this year, I observed a number of leaves on the lower part of the vine, to have spots on them resembling iron rust, which in a short time extended over the leaf, and finally killed it. The spots would also appear on the leaf stem, and on the young shoots of the vine, not, however, affecting the fruit until it attained to the size of a large pea, when it attacked that also. A small reddish spot, resembling a rotten speck in an apple, would appear on one side of the grape, and spread so rapidly as in one or two days completely to surround, and entirely to kill it.—The disease, thus far, has been confined to about half the vine, on which part the fruit is mostly filled.

Respectfully, thy friend,

JOHN OSBORNE.

Smithfield, (R. I.) 8th month, 1, 1827.

[TRANSLATION.]

To Mr JOHN OSBORNE—I have received your favour of the 13th current, concerning the malady of the grape vine, which you planted in 1823. I answer you in French, because although I understand the English language, I am not habituated to writing it. The disease is a very dangerous one, for which the remedies hitherto applied are not wholly effectual. It proceeds, oftentimes, from two opposite causes—a soil too highly manured, or too poor—the application of too powerful and active dung may occasion it—or if the vine has not a sufficiently free circulation of air. Rains and humidity may often produce the disease. It is not an insect, which causes it; it is a plant of the fungus tribe, which propagates itself in an extraordinary manner. Some plants of this sort are white, and are called generally the miller—others are red or black. They are all dangerous on account of the extent and rapidity of the injury which they do to trees. This complaint is not common in open and exposed situations. The curative or remedial means are, to collect all the leaves which fall, and to burn them, which should be repeated till the plant loses its last in autumn,—washing the leaves with a composition of flour of sulphur, black soap, and tobacco leaves, a receipt for which I sent to my respectable friend Hon. JOHN LOWELL, President of the Agricultural Society of Massachusetts, who caused it to be inserted in the New

England Farmer, last year,* which you probably take, or can procure from one of your friends.

This composition, which can never produce any ill-effects, will in a great measure check the progress of this fungus or parasitic plant, the cause of the disease on your vines.

I am sorry that you did not write to me earlier, for if you continue to abandon your vine to itself, I would not answer for its life. Be pleased to write me, if you should receive any benefit from the application of my remedy, for it is a point of great interest with me, to see the vine successfully cultivated in this country. As this disease affects the plant greatly, and weakens it, I would advise you to sacrifice the fruit which is now on it, for they will come to little or nothing. This may give more force to the vine, which at best will suffer by being obliged to push forth new leaves. I would also strip off a quarter of the leaves which are most injured, but not more.

You are authorized to publish this letter in the New England Farmer, for the Editor of which I have the highest esteem; and I shall be happy if I can aid the numerous readers of that paper in the culture of a fruit so delicious as the grape.

I am, with esteem, your

Very humble servant,

ANDREW PARMENTIER.

Horticultural Garden, Brooklyn, N.Y. July 17.

DISEASE IN APPLE TREES.

Mr FESSENDEN—I am grieved to state, that a disease has this year appeared on many of my apple trees, (from 20 to 30 years old) which resembles in its effects the disease of the Pear trees.—It attacks the extremities, which die suddenly with the fruit upon them, which instantly becomes dry, and as hard as dry wood. The trees attacked are in all sorts of soils, some in bearing, and some which never bore. I have been always afraid that the insect would go to the apple, as its wood is so much allied, or so similar, to that of the pear, being, in fact, of the same family.

Respectfully yours, J. LOWELL.

Roxbury, Aug. 1, 1827.

FRUIT TREES.

Mr FESSENDEN.—The following question is addressed to experienced cultivators of fruit, and an answer requested by

W. D.

Will suckers proceeding from the roots of fruit trees, if grafted, make as good and fruitful trees, as seedlings?

ARABIAN HORSE.

The Arabian horse *Godolphin*, the best ever imported into England, was introduced in the following manner. Col. Cook, a man of wealth, education, and polished manners, but a highway robber, committed two acts of felony about the year 1720; and thinking it impossible to elude the hand of justice if he remained in England, he embarked for the Mediterranean, and travelled through Syria into Arabia Petrea, where he made constant inquiries of the Arabs concerning the best horses in the country. Having received information that a cer-

* See New England Farmer, vol. v. page 49.

tain Sheik had the best horse in all Arabia, he went to him, and offered him any sum of money he pleased to demand for said horse. The Arab scornfully rejecting his offer, he skulked about in the vicinity, and when a favorable opportunity offered, stole the horse, and travelled through the deserts until he arrived at Damietta, near the mouth of the Nile, where he embarked with his horse, on board of a British ship. He arrived in England, and knowing his crimes were so great that he must perish, unless the prime minister interposed in his behalf, he went to lord Godolphin, under a fictitious name, and after many entreaties persuaded his lordship to accept of this fine Arabian horse as a present. Soon after this, he was discovered, arrested, and committed to prison for his former crimes. He wrote to lord Godolphin, disclosing his real name, and requesting his intercession with the king. The king ordered a writ of *nolle prosequi* to be issued, declared that Cook could not be the man who committed the felonious acts, and restored him to his former rank and family.—The foregoing is an abstract of an account published in a Virginia paper.

Dr Sturm, professor of agriculture in the University of Bonn, in his breeds of horses, calls the Arabian horse the primitive race, or the horse of the dry plains. The breeds the nearest to the Arabian, and which have been produced by crossing, are the Egyptian and Persian, which differ but little from the Arabian; the Turkish, derived from a mixture of the Arabian and Persian; the Barbary and Tartar; the breeds of Hungary and Poland; and the English saddle horse, which is a product of all.—(Translated from the "Bulletin des Sciences.")—*Hamp. Gaz.*

VOLCANOES.

Dr. Daubeny, who has examined and described most of the volcanoes in Europe, ascribes their action to the heat produced in the metallic bases of the earths and alkalis in the interior of the earth, by the access of water. As the lavas and other products of volcanoes are composed of materials intimately allied with the constituent parts of granitic and other primary rocks, feldspar and mica, variously modified, forming more than nine-tenths of the whole; Dr D. concludes that the volcanic force is situated among the older rock formations, at a depth at least as great as that to which granite extends. The enormous quantity of matter that has been ejected from volcanoes, affords conclusive proof that the volcanic agency is situated at a great depth. The matter thrown out by Vesuvius at different times far exceeds the bulk of the mountain, and yet the latter has undergone no diminution. With regard to water finding access to the inflammable, metallic bases, Dr D. states that nearly all the volcanoes on the globe are situated within a short distance of the sea, or occur in ranges of mountains the extremities of which are close to the sea; and he supposes that the water at the bottom of the ocean is forced through the pores and crevices of the subjacent rock, by the powerful influence of pressure derived from the vast column of superincumbent fluid. Earthquakes are believed to derive their origin from the same cause. The shocks are most

severe in countries where there are no volcanoes to give vent to the elastic force. The eruptions of Vesuvius and Etna are almost always preceded by earthquakes, which cease as soon as an opening has been made in the mountain.

Dr. D. describes the vast extent of the volcanic matter which Etna has poured forth. Some of the beds of lava are 4 or 5 miles in breadth, 15 miles in length, and from 50 to 100 in thickness.

DR HARRIS' ESSAY ON THE MELOLONTHIA.—CONCLUDED FROM PAGE 10.

The *rose-chaffer*, or *rose-bug*, as it is commonly called, is also a diurnal MELOLONTHIA. It is, exclusively, an American insect, and presents such peculiarities in form as would warrant its separation from the genus MELOLONTHIA,* although it agrees with others of the genus in habits and economy.

This species is described by Fabricius as MELOLONTHIA *subspinosa*, because the thorax is armed, on each side, with a blunt spine, or tubercle; it is called *M. polyphaga* by Melzheimer, probably because of its voracity; *elongata*, by Herbst, from its elongated form; and *angustata*, by Beauvois, from the narrowness of its thorax. A description of this well known insect would be superfluous.

As to its habits—among the most remarkable are its voracity and salaciousness. It attacks, without much discrimination, almost every tree, shrub, and plant, such as the oak, elm, cherry, and apple trees, the rose, sumach, and elder shrubs, and even herbaceous plants, particularly the common white-weed, CHRYSANTHEMUM *leucanthemum*. Generally, during the day-time, we find these insects paired, the male holding the female closely embraced, even when not in *coitu*. The male is readily distinguished by the greater length of the legs, and the elongated, pointed extremity of the body.

The *rose-chaffer* makes its appearance at the time of blossoming of the damask rose, which usually happens about the middle of June. It is remarkable that it does not attack the cinnamon rose, which blooms earlier, and is often found on the elm and oak before it appears on the garden and wild rose. It continues about four weeks, and then suddenly disappears, and in three or four days scarcely an individual is to be seen.—The first *rose-chaffer* that I observed the present year (1826), was discovered on a small elm shrub, on the sixth of June; none had as yet appeared on the rose. The general disappearance of these insects took place on the eighth of July, although a few individuals still remained on the flowers of the elder, as late as the fifteenth of July. A vul-

*STENOCHORAX would be an appropriate name for the subgenus having the *subspinosa* for its type.

SCARABÆUS *lanigerus*, LINNÆUS MELOLONTHIA *lanigera*, Fabr. has been referred to the genus RUTELA; but Schonherr says it is not a RUTELA, and arranges it between *M. fastuosa*, and *M. aurata*, L., belonging to the genus ANOPLA? it may therefore be considered as the type of a new subgenus. See Schonherr's Synonymia Insectorum, III. p. 591. SCARABÆUS *paucitatus*, Linn., MELOLONTHIA *punctata*, Fabr. or RUTELA *punctata*, Latreille, belongs to Mr MacLeay's genus DELIDNOFA.

MELOLONTHIA *parvius*, Fabr. is congenetic with the ANOPLA *ritis* of Megele and Koppé.

gar notion prevails that the *rose-bug* turns into a green horse-fly, because the common TABANUS makes its appearance about the time that the former disappears. This opinion is incorrect, though not more inconceivable than the known metamorphoses of insects.

After the sexual union is accomplished, the males perish: you may then see thousands of them dead on the ground beneath your *rose-bushes*, and you will seldom find a female among them. The latter at this time enter into the earth to deposit their eggs. I have found the female more than a foot below the surface, where she was probably preparing to oviposit. Towards the termination of their ravages the females are frequently found solitary, seem considerably defaced, the downy coat which covers their thorax and elytra being rubbed off. From this circumstance we may conjecture that these individuals have already entered the earth and deposited their eggs, and have returned to the surface to linger a few days without further sexual union.

I have not ascertained the period when the larva is hatched, nor the length of time that expires before it attains its growth. Nor am I positive as to the identity of the larva; although I have strong reasons for believing that what I have taken to be such is really so; further observation is however necessary. The supposed larva is a small white grub; the head covered with a corneous shell of a yellowish colour: the mouth armed with strong mandibles or teeth; and the anterior extremity furnished with six short feet; a dark line runs down the back, occasioned by the dorsal vessel, containing a blueish fluid, which is conspicuous from the transparency of the skin.—The larva moves with considerable celerity when first taken out of the earth: it is about half an inch long, and one line in diameter. That it is the grub of a MELOLONTHIA is certain from its close resemblance to that of others of this genus; that it is, most probably, the larva of the *rose-bug* is to be inferred from its being found in the same location as the pupa, and in considerable quantities.

The pupæ, from which I obtained *rose-bugs*, were found, early in June, (1826,) three or four inches beneath the surface of the ground. They are of a yellowish white colour, which gradually becomes darker as they approach the perfect state. In the pupa the rudiments of the wings, the antenna and the legs are discoverable, folded under the body, and enclosed beneath a thin membrane, which wraps each separately; the eyes appear as two blue spots: the dorsal segments of the body are prominent in ridges; the tail is acuminated, and retains upon it, the exuvie or cast-skin of the pupa, until a few days before it throws off its last covering, and emerges from the earth a perfect insect. This last and important change is not effected but by the greatest efforts, during which the pupa appears to writhe in agony, until, by its continued exertions, it bursts its membranous shroud, and crawls to the surface, where its wings are expanded and dried, and it becomes, from a crawling worm of the earth, an animated tenant of the air. This interesting metamorphosis I had the pleasure of witnessing through the side of a glass vessel containing earth in which I had placed several of the pupæ.

An insect in its larva or grub state may be said to be in *embryo*; as its organs are more and more developed, the different membranes, or skins, are

successively ruptured and cast off, and when it has finally extricated itself from its last covering, and emerged from its mother earth, it bursts into life a perfect adult, and finds itself endowed with new powers, and feels the influence of new desires. In this state, only, is it capable of continuing its species, and furnished with wings to carry it through the air in search of companions and food.

Rose-bugs are eaten greedily by fowls; but young chickens sometimes suffer severely from swallowing them alive. A simple remedy consists in pouring sweet-oil down their throats.—When the powers of the *rose-bug* are exhausted it falls to the ground, and furnishes food for various insectivorous animals, particularly ants. In France, a large insect, called *vinagrerie*, (*CANARIS auratus*, Linn.) devours the female MELOLONTHIA *vulgaris* at the moment when she is about to deposit her eggs. I have taken one specimen of this fine CANARIS in this state, and we have several other species which are equally predaceous, and which probably contribute to check the increase of our native species of MELOLONTHIA.

French writers mention several methods which have been proposed for the extermination of these insects. Most of them are ineffectual.* Et cetera. In his *Histoire des Insectes nuisibles*, I. 132, says, that Christian Kieeman, in a memoir sanctioned by the Electoral Palatine Academy, gives the history of that species called by the French *Hanneton vulgaire*. His observations were made in 1761 and 1762, when these insects were very numerous and destructive. He recommends making a general pursuit of them; declaring that he had killed more than one thousand in one day. This I suspect will prove to be the best method. It has been found useful to strew upon the grape-vine air-sacked lime, which causes the *rose-bugs* to abandon it. Fires by night do not attract them. I have held a bright light, without in the least exciting them; and although this light was exhibited in the open air, in their immediate vicinity, for a long time, not one *rose-bug* approached it. The ABBE ROSIER, in his *Cours d'Agriculture*, (article *Hanneton*.) advises to collect and destroy the perfect insect for several years in succession. This should be made a general pursuit in order to be effectual; and females and children might be employed in it.

The causes that contribute to the growth and increase of the larvæ are not sufficiently understood. The severity of winter, and the coldness and moisture of a succeeding spring, do not always appear to check the numbers of the perfect insect, which are often, according to Olivier,† developed in greater abundance after such seasons. Neither can we predict a great increase from an abundant oviposition; for the eggs may not be hatched, the larvæ may perish, or the pupæ remain too weak to undergo their last metamorphosis. On the contrary, a small number of eggs, deposited under circumstances favorable to their being hatched, and the larvæ perfected without accident, will cause an increased quantity of the perfect insects.

Certain localities are thought to be favorable to the increase of the *rose-bug*; what these are I have not ascertained; but should imagine that a

*See Nouv. Dictionnaire d'Histoire Naturelle. article *Hanneton*.

† Olivier's remarks refer to the *M. vulgaris*.

warm fertile, and rather dry soil, which is not disturbed by the plough or spade, would furnish an appropriate *nicus* for the egg.

ON MARL.

Marl, like lime, may be viewed as a stimulant, forcing the soil to produce crops of corn and grass, which otherwise would not have been obtained. Marl has been long known to the husbandman of Great Britain; and, if we give credit to Pliny, this article was used prior to the Roman invasion. Several kinds are enumerated by the ancient Latin writers, and all of them declare that the soil was greatly enriched by the application of marl.

In many parts of this island the value of land has been much augmented by the application of marl. Treating of this article in a practical way, it may be divided into shell-marl and earth-marl. Shell-marl is composed of animal-shells dissolved; earth-marl is a fossil. The color of the latter is various; white, black, blue, red, and its hardness is as various as its color; being sometimes soft and ductile like clay, sometimes hard and solid, like stone, and sometimes extended into thin beds, like slate. Shell-marl is easily distinguished by the shells which always appear in it; but the similarity betwixt earth-marl and many other fossil substances renders it difficult to distinguish them.

Shell-marl is very different in its nature from clayey and stone-marls, and, from its effects upon the soil, is commonly classed among the animal manures. The Rev. Mr. Dickson states, "That it does not dissolve with water as the other marls do. It sucks it up, and swells like a sponge. It is a much stronger attractor of acids than they." Dr. Hume says, that it takes six times more of acids to saturate it than any of the other marls which he had met with. But the greatest difference betwixt the shell-marl and the other marls consists in this, the shell marl contains oils. It is uncertain if the other marls contain any oils; but this kind it is said, contains them in great plenty.

This marl, it would seem, from the qualities which it possesses, promotes vegetation in all the different ways. It increases the food of plants; it communicates to the soil a power of attracting this food from the air; it enlarges the pasture of plants; and it prepares the vegetable food for entering their roots.

The shelly sand, often found deposited in beds in the crevices and level parts of the sea-coasts, is another substance capable of being employed both as a manure and stimulant; not only on account of its containing calcareous matter in greater or less proportions, but also from the mixture of animal and vegetable substances that are found in it. The portion of calcareous matter which it contains must vary according to circumstances; but, when the quantity is any way large, and in a reduced or attenuated state, the quality is so much the more valuable. On that account, the quantity which ought to be applied to the soil must be regulated entirely by the extent of calcareous matter supposed, or found, upon trial, to be contained in the article, which, as already said, is very variable.

The clayey and stone marls are distinguished by their colors; viz. white, black, blue, and red. The white, being of a soft crumbly nature, is considered to be the best for pasture land; and the blue, which is more compact and firm, for corn land. In the districts where marl is much used, these

distinctions of management are attended to, though either of the kinds may be employed with advantage if the following rules are adhered to.

If marl is of the blue kind, or of any kind that is compact and firm, lay it upon the land early in the season, so as the weather may mellow it down before the last plough; and, if on pasture land, let it also be early laid on, and spread very thin, breaking any lumps afterwards which are not completely separated by the first spreading. If marl is of the white, or any of the loose or crumbling sorts, it need not be laid on so early, because these varieties break and dissolve almost as soon as exposed to the weather.

There are many kinds of impure and mixed marls, such as sandy, clayey, loamy, and stony marls, according as these varieties of soil are incorporated or mixed with the principal substance. These sorts, of course, are inferior to the pure marls; but the stoney kind is considered to be the best, because its efficacy is more lasting, though the fat and crumbling kinds enrich or operate more speedily. The hard marls, however, in every case, operate for the greatest length of time, and are often followed with bad consequences to the soil unless good management, with regard to cropping, is exercised during the period of their operation. After being long excessively fruitful and productive, the soil will gradually become so sterile and barren as scarcely to be worth cultivating; in which case, the greatest exertion can hardly procure a return of fertility. In this respect, the effect of over-cropping land that has been marled, is precisely the same as takes place with lime. An uncommon exertion is made, occasioning a proportionate debility; though, were good husbandry studiously practised, the exertion would neither be so excessive, in the first instance, nor the after-consequences so mischievous. In numerous instances, land has been reduced so much as to be thought little better than useless, by the effects of lime and marl. Both, however, are excellent agents in forwarding agriculture, though often their agency has been misapplied, and used for mischievous purposes. Under a correct rotation of cropping, and with a suitable supply of dung, neither the lime nor marl is injurious. Reverse these circumstances, and the contrary effect must necessarily be produced.—*Brown's Treatise on Agriculture and Rural Affairs.*

HARVESTING.

When crops are suffered to stand on the ground until they have fully ripened, they exhaust the soil considerably more, than if taken off in a green state. The same is the case in regard to weeds of every description. Perhaps the remark is not so fully applicable to crops of roots.

It may therefore be said that lands are negatively improved, in a saving of their usual exhaustion, by taking such crops off the ground as soon as they have attained a sufficient degree of maturity. This is a matter that is worthy of consideration, especially when it is remembered that several kinds of crops may be severed from the ground, without injury, in some cases with a saving, before they have fully ripened.

Thus, Indian corn may be cut up while the stalks are still greenish, and set up in shocks for the ears to harden; and in this way much good fodder will be saved; the ground is less exhausted, and the grain is said to be as good. By harvesting oats while the stalks are somewhat green

they will be the better for fodder, and the grain will receive no injury thereby. The same may be observed, to a certain extent, in regard to crops of wheat and rye.

Flax pulled when just out of blossom is considered by some the best. The pea-pod is injured by standing too long; as in that case the hull becomes of little value. In short, no crops of grain derive any benefit from standing until the stalks are completely dead, except when the grain is to be used for seed.

The period at which wheat, and in short, all the other sorts of white crops should be cut, is when the straw begins to shrunk, and becomes white about half an inch below the ear; the circulation is then cut off and all further benefit from its standing is at an end; the grain has, in fact, taken every thing that is requisite to perfect it from the ground.

By cutting early it will yield more and whiter flour; will waste less by shelling; the harvesting will be expedited, so as to prevent the waste of shelling, by having the last cuttings become too ripe; and as far as the value of the straw, whether for fodder or other purposes, is concerned, an advantage is gained by cutting it while the circulation is going on, and by that means preserving a part of the natural juices; the value of straw, like that of hay, depending upon the proportion of natural juices it contains, and the pains which have been taken to preserve them.

Some farmers determine when grain is fit to cut, by the following signs: when the straw is all turned, excepting at the joints; when the kernel becomes so hard that it cannot be mashed between the thumb and finger; or when the straw below the ear becomes so dry, that no juice can be forced out by twisting it. If the weather is fine, it can be bound, and put into the shock immediately after cutting; but if the stalk is stout, and the ear full and heavy, it should lay till the after part of the day; it can then be bound, shocked, stacked, or carted with safety, provided it is housed where it can have free air, or the mows do not become too large. Sheaves should generally not be larger than can be bound with a single length of the straw. Grain should be carted when the air has a small degree of dampness, to prevent scattering.

When a severe blight or rust has struck rye or wheat, it should be cut immediately, even if the grain be in the milky state; and it should lie on the ground, but not so close as to injure the heads, until such time as the stalks have become dry and the grain somewhat hardened.

It is mostly advised that such grain as is much infested with weeds, should be cut three or four days earlier than is usual, that the weeds may wither before the grain become too ripe. A single shower, or even a day's gentle rain, while it lies in swath will not injure it. It is a most essential object, to cut the crop very low, to prevent both the waste of grain, and the loss of straw, the unavoidable consequences of high cutting.

When grain is stacked, a light floor of boards should be mounted on four blocks, set in the ground, and so high as to prevent the entering of vermin. In building a stack, care should be taken to keep the seed ends of the sheaves in the middle, and a little higher than the outer ends.—*Farmer.*

Hon. William Jarvis, of Weathersfield, is nominated a candidate for Governor of Vermont.

From the American Farmer.

ON THE SACCHARUM OF THE SWEET POTATO,

AND ITS FITNESS TO MAKE BEER,

By Robert Hare, M. D. Professor of Chemistry in the University of Pennsylvania.

PO JOHN HARE POWELL, ESQ.

Corres. Sec'y of the Pen. Ag. Soc'y.

Dr Tidyman, of South Carolina, lately supplied me with some sweet potatoes, of a kind in which sweet matter is peculiarly abundant, and requested that I would ascertain if there were any sugar in them. Having pared, and by means of the instrument used for slicing cabbages or cucumbers, reduced them to very thin slices; about a pound was boiled in alcohol of the specific gravity of 845, which appeared to extract all the sweetness, yet on cooling, yielded no crystals of sugar. The solution being subjected to distillation, till the alcohol was removed, an uncrystallizable syrup remained. In like manner, when aqueous infusions of the potatoes were concentrated, by boiling or evaporation, the residual syrup was uncrystallizable. It appears, therefore, that the sweet matter of this vegetable is analogous to molasses, or the saccharum of malt.

Its resemblance to the latter was so remarkable, that I was led to boil a wort, made from the potatoes, of proper spissitude, say s. g. 1060, with a due quantity of hops, about two hours.

It was then cooled to about sixty-five degrees, and yeast was added. As far as I could judge, the phenomena of the fermentation, and the resulting liquor, were precisely the same as if malt had been used. The wort was kept in a warm place until the temperature was 85 F. and the fall of the head showed the attenuation to be sufficient.*—Yeast subsequently rose which was removed, by a spoon. By refrigeration a further quantity of yeast precipitated, from which the liquor being decanted, became tolerably fine for new beer, and in flavour, exactly like ale made from malt.

I have computed that five bushels of potatoes, would produce as much wort as three bushels of malt; but I suppose that the residue would, as food for cattle, be worth half as much as the potatoes employed.

I believe it possible to make as good liquor from malt in this country, as in England, but that in our climate much more vigilance is required to have it invariably good, principally because the great and sudden changes of temperature, render mashing much more precarious. Should the saccharum of the sweet potato prove to be a competent substitute for that of germinated grain, the quality will probably be less variable, since its development requires but little skill and vigilance.

Besides, as it exists naturally in the plant, it may be had where it would be almost impossible to make, or procure malt. Hops, the other material for beer, require only picking and drying to perfect them for use.

They are indigenous to the United States, and may, no doubt, be raised in any part of our territory.

I have dried in my evaporating oven, some of the sweet potatoes in slices. It seems to me that in this state they will keep a long while, and may be useful in making leaven for bread. They may

* In passing to this state, there should be a loss of gravity of about 4 per cent.

take the place of the malt necessary in a certain proportion, to render distillers' wash fermentable. The yeast yielded by the potato beer, appeared in odour and flavor, to resemble that from malt beer surprisingly, and the quantity, in proportion, was as great. In raising bread it was found equally efficacious.

I propose the word *suaivin*, from the Latin *sua-vis*, sweet, to distinguish the syrup of the sweet potato. The same word might, perhaps, be advantageously applied as a generic appellation to molasses, and the uncrystallizable sugar of grapes, of honey, and of malt.

Crystallizable sugar might be termed *saccharine*, since the terminating syllable of *saccharum* is appropriated in chemistry to metals.

PICTURE OF A DROUGHT.

The last Macon Telegraph, after stating the very flattering prospects of the planter a few weeks since, says, the scene is now changed.—From almost every part of the state we hear the most melancholy accounts of the long continued drought, and the utter prostration of the hopes of the farmer—the structure on which the prosperity of the whole community is based.

With a few exceptions, the drought is very general. In some districts no rain has fallen for many weeks; the earth has become fairly baked, and vegetation entirely suspended. Whole cornfields are entirely destroyed; the cornblades, contorted and scorched, fall to the ground; and the shrivelled stocks smoke with heat.

The cotton plant, from its slower growth and deeper roots, suffers later than corn; but it also begins to feel the effects of the drought. The leaves burn up and flowers wither and fall, leaving no boll in their place.

The animal as well as the vegetable kingdom pants with the excessive heat and drought. Inhabitants of ponds and streams are boiled in their own element, or perish by its evaporation. Cattle crop the juiceless herbage, and look to man in vain for succor; their emaciated carcasses and sunken eyeballs, as they watch the reluctant clouds, speak the keenness of their suffering.—Large streams have sunk to narrow rills, and fountains are drying up. Instead of dew, impalpable dust, lifted into the air by its dryness and buoyancy, falls on the thirsty herbage. Indeed the atmosphere, in many parts, travellers assure us, is so filled with dust, that respiration is extremely difficult. [Savannah paper.]

CANADA THISTLES.

Dr. Silas Holbrook, of Venice, N. Y. some years since purchased a farm, where he now resides, and found a spot of a quarter of an acre of the Canada Thistle in one of his fields, which from appearance had tenanted the spot for some years. He waited until the blossom appeared, then set his boys to thrash or bruise them thoroughly to the ground; a very few stalks sprouted up again that season, which he bruised and sprinkled with salt. The next season but one solitary stalk made its appearance in the field, which he destroyed in the same way; and declares, he has never seen one on the premises since. [Auburn Free Press.]

A London Alderman is said to have lately made £50,000 by his dealings in hops, and that he would have made £100,000, if it had not been for the perverse intermeddling of the press.

ACACIA.

The *Robinia*, *Pseudo-acacia*, or false acacia, is a native of the United States. It is commonly termed locust tree.

It grows best in warm, sandy land, and becomes fit for timber in about twenty-five years. The greatest use made of the trees, is for ship trencels, fence posts, mill cogs, and fire wood; or, if worked into posts to be set into the ground for garden fences, and other inclosures, they are superior in point of durability to almost any known wood.—The acacia is ornamented as a flowering tree.—The blossoms unfold in June, and perfume the air to a considerable distance with their sweet and fragrant odour. It is easily cultivated, and is of quick growth. As commerce and manufactures improve, the demand for this valuable timber will increase.

The multiplication of this tree has seldom been attempted by seeds, but almost constantly by young trees sprouting up from the wounded roots of the old one. The readiness of the roots of the parent tree, to vegetate, soon after the incumbent sward is broken up by the plough, surpasses that of any other tree; for in soils favourable to their growth, the farmers are obliged to grub with great labour to prevent them from overrunning the land, and whenever suffered to indulge their native luxuriance, they will soon convert a piece of cleared land to forest. It makes good hedges.

Acacia may be propagated by setting the seeds, and, when it is once introduced, numerous plants may be obtained, by cutting its roots near the surface of the ground. As the roots extend rapidly along the surface of the earth, and shoot up numerous suckers, the Acacia may be advantageously planted on the banks of rivers, for consolidating and securing the soil from the encroachments of the current; farther, its wood is eminently adapted to ship building, and, though inferior in point of durability to the oak, it is perhaps preferable to any other timber for barges, and similar vessels of a small size.

The leguminous seeds of this tree, after being divested of their acrid taste, by infusing them in different waters, and afterwards ground into meal, are by the Tungusian Tartars converted into a wholesome bread: these seeds are also eagerly eaten by poultry, which may thus be speedily fattened.

It has been asserted, that the leaves of this tree, when prepared in the same manner as *indigo*, may with great advantage be substituted for that expensive dyeing drug. The foliage of the smaller variety of the False Acacia, however, is reputed to be better adapted for such purpose: its culture corresponds with that above stated; and it certainly merits to be more generally cultivated in ornamental shrubberies, where it thrives rapidly, and produces elegant odoriferous yellow flowers, which abundantly supply bees with honey.—The seeds of both varieties also afford a large proportion of expressed oil. It deserves to be noticed, that the yellowish wood of these trees, though hard and tough, is very brittle while the plants are young, and they ought, therefore, in exposed situations, to be supported by stakes.

The leaves of acacia are said to afford an agreeable nourishment to horses and horned cattle.—They may be given either green or dry, alone or mixed, with hay or chopped straw.

The flowers of the acacia are said to be used by the Chinese in making that beautiful yellow with.

which they stain their silks and stuffs, and colour their paper, in the following manner; take half a pound of these flowers before they are fully blown, and roast them over a clear and gentle fire in a very clean copper pan, continually stirring them with a brisk motion; when they begin to turn yellow, pour on a little water, and let it boil till it become thick, and acquire a deeper colour; then strain the whole through a piece of coarse silk.—To the liquor thus expressed, add half an ounce of alum, and one ounce of calcined and finely-powdered oyster shells; when the whole is well mixed, it will be fit for use.

Domestic Encyclopedia.

EFFECTS OF LIBERTY.

In the dark ages which followed the downfall of the Roman Empire, several republics were founded in the northern parts of Italy; and while ignorance and barbarism prevailed in other European countries, these states under the influence of free institutions, became rich and powerful, and enjoyed the comforts and ornaments of life. "Their ships covered every sea; their factories rose on every shore; their money changers set their tables in every city; and manufactures flourished. We doubt whether any country of Europe, our own perhaps excepted, have at the present time reached so high a point of wealth and civilization as some parts of Italy had attained 400 years ago." The revenue of the republic of Florence was greater 500 years ago, than that which the Grand Duke of Tuscany (in whose dominions Florence is situated) now derives from a territory of much greater extent. The manufacture of wool alone employed 200 factories and 30,000 workmen in that republic; and the cloth annually produced sold for a sum equal to \$11,000,000 of our money. Eighty banking houses conducted the commercial operations, not of Florence only, but of all Europe. Two banking houses advanced to Edward the Third of England, a sum in silver equivalent to \$3,300,000, when the value of silver was quadruple what it now is. The city and environs contained 170,000 inhabitants; 10,000 children were taught to read in the various schools; 1200 studied arithmetic; and 600 received a learned education. The progress of literature and the arts was proportioned to that of the public prosperity.

All the seven vials of the Apocalypse have since been poured out on those pleasant countries.—Their political institutions have been swept away; their wealth has departed; literature and the arts have declined; the people are trampled on by foreign tyrants, and their minds are enslaved by superstition; eloquence is gagged and reason hoodwinked. [Edinburgh Review.]

WOOL.

A procession of waggons arrived yesterday from Pittsford, (Vt.) with about 19,000 lbs. of Wool.

What is to be done with American Wool, if it is not to be manufactured in America. Sent to Europe? Send "Coal to Newcastle." If the Wool is not to be manufactured here, it cannot be grown here to any profit. The growers want a home market on some terms. *Boston Palladium.*

THAMES TUNNEL.

The aperture which had broken in the Tunnel under the Thames has been closed, after much labour and difficulty.

MULBERRY LEAVES.

Within a year past, the demand for Mulberry leaves has so rapidly increased, that it would be well for those who gather the fruit, to be careful in the preservation of the seed. By thus laying a foundation for a nursery of young trees, a benefit will be conferred on all who feel interested in the increase of the silkworm. In the course of a few years, it is anticipated that the manufacture of silk will form an important article in our domestic concerns, and although there will necessarily some time elapse previous to its being carried to any great extent, yet every Mulberry tree that is planted now will contribute something towards its advancement. [Phil. Album.]

CURE FOR DYSENTERY.

A friend has communicated the following, as a cure for that terrible complaint, the Dysentery, which is so apt to prevail at this season of the year. He says he has repeatedly tried it, with the fullest success:—"Take the yolk of three eggs, two ounces loaf sugar, one gill brandy, and one nutmeg, grated, the whole to be incorporated together.—For a grown person, a teaspoonful every two or three hours—a proportionably less quantity for children. [Prov. Pat.]

A lady who has found the following remedy for the prevention of bed bugs, wishes to make it public. After cleansing the bedstead thoroughly, rub it over with hog's lard. The lard should be rubbed on with a woollen cloth. Bugs will not infest such a bedstead for a whole season. [Ohio pa.]

NEW ENGLAND FARMER.

BOSTON, FRIDAY, AUGUST 10, 1827.

FALLEN FRUIT.

Be very careful to gather all punctured or decaying fruits, whether on your trees or on the ground, and give them to your hogs. If you do not, the worms which they contain, and which have been the cause of their premature decay, will make their escape into the ground, and you will find the evils, which await their visitations will increase upon you another season.

GRAFTED TREES.

Look over your fruit-trees, which were grafted last spring, or budded last summer, and suffer no shoots from the stocks to remain, for these will rob the grafts of their nourishment.

BUDDING FRUIT TREES.

The operation of common budding is performed any time from the beginning of July to the middle of August; the criterion being the formation of the buds in the axille of the leaf of the present year. The buds are now to be ready by the shield or partition of bark to which they are attached, easily parting with the wood. The buds preferred are generally those on the middle of a young shoot, as being neither so apt to run to wood as those at the extremity, nor so apt to lie dormant as those at the lower end. Stocks for budding may in general, be much smaller than for grafting, as the operation may be performed on the same year's shoot. But it may also be performed on shoots or stems of several years' growth, and in such, by inserting a number of buds, a complete tree may be formed at once. For gathering the shoots containing the buds, a cloudy day or an

early or late hour is chosen, on the principle, that the leaves being at these periods in a less active state of perspiration, suffer least from being separated from their parent plant. They are preserved fresh, and may be sent a great distance by inserting their ends in water or moist moss; though, in general, they should be used as soon after gathering as possible; indeed, as in grafting and narching the whole operation ought to be performed with the greatest celerity.

There are a great many kinds of budding, but we shall describe only the four following, which are copied, in substance, from Loudon's Encyclopedia of Gardening.

Shield budding, or T budding is thus performed:—Fix on a smooth part on the side of the stock, rather from than towards the sun, and of a height depending, as in grafting, on whether dwarf, half or whole standard-trees are desired; then with the budding knife make a horizontal cut across the rind, quite through to the firm wood; from the middle of this transverse cut, make a slit downward perpendicularly, an inch or more long, going also quite through to the wood. This done, proceed with all expedition to take off a bud: holding the cutting or scion in one hand, with the thickest end outward, and with the knife in the other hand, enter it about half an inch or more below a bud, cutting near half way into the wood of the shoot, continuing it with one clear, slanting cut, about half an inch or more above the bud, so deep as to take off part of the wood along with it, the whole about an inch and a half long; then directly with the thumb and finger, or point of the knife, slip off the woody part remaining to the bud: which done, observe whether the eye or gem of the bud remains perfect; if not, and a little hole appears in that part, it is improper, or as gardeners express it, the bud has lost its root and aoother must be prepared. This done, placing the back part of the bud or shield between your lips, expeditiously with the flat haft of the knife separate the bark of the stock on each side of the perpendicular cut, clear to the wood, for the admission of the bud, which directly slip down, close between the wood and the bark to the bottom of the slit. The next operation is to cut off the top part of the shield even with the horizontal first made cut, in order to let it completely into its place, and to join exactly the upper edge of the shield with the transverse cut, that the descending sap may immediately enter the bark of the shield, and protrude granulated matter between it and the wood, so as to effect a living union. The parts are now to be immediately bound round with a ligament of fresh bass, previously soaked in water, to render it pliable and tough, beginning a little below the bottom of the perpendicular slit, proceeding upward closely round every part, except just over the eye of the bud, and continue it a little above the horizontal cut, not too tight, but just sufficient to keep the whole close, and exclude the air, sun, and wet.

Shield-budding reversed, or reversed J budding, differs from the former in having the transversed cut made at the bottom of the perpendicular slit, instead of at its top, and of course the shield is reversed in its position. This mode is represented as preferable to the other by such as contend that the sap rises in the bark equally with the wood; but as this opinion is now generally considered as exploded, the first or T mode, may justly be considered as the most scientific mode of

budding.

Scalope budding consists in paring a thin tongue-shaped section of bark from the side of the stock; and in taking a similar section from the shoot of buds, in neither case removing the wood. The section or shield containing the bud is then laid on the corresponding scollop in the stock; its upper edge exactly fitted, as in shield budding, and at least one of its edges as in whip-grafting. After this it is tied in the usual way. The advantages of this mode are, that it can be performed when the wood and bark do not separate freely; on trees having very stiff suberose [cork like] barks, and at any season of the year. Its disadvantages are, that it requires longer time to perform the operation, and is less certain of success. The French gardeners often bud their roses in this manner in spring; and if they fail, they have a second chance in July by using the common mode.

Budding with double ligatures is a mode invented by Knight, and described by him (Hort. Trans. vol. i. 149) as "a new and expeditious mode of budding." The operations are performed in the manner first above described; but instead of one ligature, two are applied, one above the bud inserted on the transverse section through the bark; the other, which had no farther office than that of securing the bud, was applied below in the usual way. As soon as the buds had attached themselves, the lower ligatures were taken off; but the others were suffered to remain. "The passage of the sap upwards was in consequence much obstructed, and the inserted buds began to vegetate strongly in July (being inserted in June); and when these had afforded shoots about four inches long, the remaining ligatures were taken off to permit the excess of sap to pass on; and the young shoots were nailed to the wall. Being there properly exposed to light, their wood ripened well, and afforded blossoms in the succeeding spring; and these would, he adds, "no doubt have afforded fruit; but that, leaving my residence, I removed my trees," &c.

Future Treatment. In a fortnight at farthest after budding such as have adhered may be known by their fresh appearance at the eye; and in three weeks all those which have succeeded will be firmly united with the stock, and the parts being somewhat swelled in most species, the bandage must be loosened, and a week or two afterwards finally removed. The shield and bud now swell in common with the other parts of the stock; and nothing more requires to be done till spring, when just before the rising of the sap, they are to be headed down close to the bud, by an oblique cut, terminating about an eighth or a quarter of an inch above the shield. In some cases, however, as in grafting, a few inches of the stalk is left for the first season, and the young shoot tied to it for protection from the winds.

STEAMING FOOD FOR SWINE, &c.

Some sort of apparatus for steaming food for swine next cattle, &c. should be considered as necessary for every farmer, as a pot or other proper vessel to cook his own food in. This is a truth which is now pretty generally acknowledged; many farmers have conveniences for steaming potatoes and other roots for swine, on a small scale, and some few, machinery on a large scale, for steaming hay, &c. for cattle. Loudon says "It has been long known that many sorts of roots, and

particularly the potato, become much more valuable by undergoing this sort of preparation. And it is equally well known that when thus prepared they have been employed alone as a substitute for hay, and with cut chaff both for hay and corn, in the feeding of horses as well as other animals.—To a farmer who keeps many horses, or cattle, or even swine or poultry, the practice of boiling their food in steam is so great a saving and advantage that it deserves the most particular attention.—Though potatoes have often been given raw both to horses and cattle, they are found to be infinitely preferable when cooked by steam, as they are thereby rendered much drier, and more nutritive, and better than when boiled in water; this has been long since shown by the experiments of Wakefield of Liverpool who in order to ascertain it, fed some of his horses or, steamed and some on raw potatoes, and soon found the horses on the steamed potatoes had greatly the advantage in every respect. Those on the steamed potatoes looked perfectly smooth and sleek, while the others were quite rough. Eccleston also found them useful instead of corn; and the extensive and accurate trials of Curwen have placed the utility and advantage of them in this way beyond all dispute.

The reader may see in the 5th vol. of the New England Farmer, page 306, some notice of the mode of steaming food for cattle, made use of by Robert Smith, Esq. President of the Maryland Agricultural Society. This was more particularly described in an Address delivered to the Maryland Agricultural Society, by Mr Smith. The following is an extract:

"Economy in the feeding of stock is an object of the highest importance, interesting alike to the public and to the individual. The great waste of hay, straw, corn fodder, chaff and other offal apparent on every estate under the prevailing practice of the country, has suggested to me the expediency of having at my dairy farm a steaming apparatus. This I have recently established on a plan so simple and so cheap, that any person in any part of our country may have a similar one, greater or smaller, according to the extent of his farm, and the proposed number of his stock. It consists of an iron boiler and two wooden boxes. The boiler contains 100 gallons. One of the boxes is eight feet, the other five feet long; both three feet wide and three feet deep. The boiler is globular, and was made by screwing together the brims of two salt pans. There is also attached to it a hoghead for any extra cooking.

"The boiler is fixed in brick work, calculated to afford the greatest degree of heat with the smallest waste of fuel. Without pretending to give directions as to the particular construction of such a furnace, I would merely remark, what the physiologists have told us, namely, that heat being produced by the combined operation of the fuel and of the air feeding the fire, that portion only of the air, which passes in contact with the burning fuel, contributes to the production of heat, and that therefore if the fire place should be longer than the heap of burning fuel, a certain portion of air will insinuate itself without going through the fire, and of course, not being decomposed will contribute nothing to the heat.

"To the water in the boiler is given all the heat necessary to generate the required steam. The steam is conveyed into the boxes by copper pipes attached to the bottom of each box, and a false

bottom, consisting of several sheets of copper perforated with holes. Into this chamber, four inches high, formed by the two bottoms, the steam is conveyed, and passing through the holes of the false bottom, diffuses itself throughout the whole contents of the box, and thus effectually cooks the great mass of food therein contained. When sufficiently boiled, the steam, by means of a common stop cock, is turned into the other box. At one end of each box and near the bottom, is a spigot and faucet, by means of which are drawn off the condensed steam and liquid matter, which had oozed out of and been extracted from the cooked materials. This decoction is of a deep chocolate colour and highly flavored. It may be given to calves or it may be returned to and mixed with the steamed food. It, however, may not be amiss to remark, that when a liquid food is proposed, the false bottom is not used.

"In the corner of the steam house next to the pump there is a hoghead of water in which is inserted a leaden tube, the other end of which is immersed in the water of the boiler and nearly to the bottom of it. The admission of the regular supply of water from this reservoir into the boiler is regulated by a stop cock. And the cold water being specifically heavier than the warm will necessarily take its place at the bottom, whilst the hot water will remain at the top. This simple plan is preferred to the self supplying valve, which is apt to get out of order. At the top of the boiler there is a safety valve for the escape of all the redundant steam, the electric force of which would otherwise endanger the whole establishment."

Mr Smith observed that his boiler of 100 gallons had enabled his people for some time to cook every day for more than one hundred head of stock, nourishing food, consisting of cut hay or straw, or corn tops and blades, or corn husks mixed with meal produced from the corn and cob ground together, or with other meal and a due proportion of water. But a boiler of the lowest price, containing 30 gallons would be sufficient to cook food for the stock of most farms in our country. A simple apparatus for the purpose of steaming potatoes and other roots for swine, &c. has long been used in many parts of New England.—The following is a brief description of it. A kettle, holding twelve gallons or more, is set in a furnace of brick or stone, and over this a hoghead with one head taken out, and the other bored full of holes. This is set so close that the steam of the kettle, when boiling, can only rise through the holes, and thence ascend among the articles to be boiled in the hoghead, and pass off at the top.—In this way a hoghead of potatoes will be nearly as soon boiled as a small part of them would be if placed in the kettle underneath.

As the kettle is so closed as to prevent any steam from passing off but through the bottom of the hoghead, a pipe or tube is set in such a manner that with the aid of a funnel water may be poured into the kettle as often as is necessary.—After being poured in, the tube is stopped with a plug for that purpose.

Grain of all kinds may be steam-boiled by this apparatus, to great advantage, for feeding or fattening cattle; but in that case, it is requisite to have the bottom of the hoghead covered with a cloth, to prevent the grain from running down through the holes.

The annexed cut will give an idea of a steaming machine described in the Farmer's Magazine

(a work printed in Scotland) vol. xviii. page 74.—It consists of a boiler and wooden chest or box placed over or near it. The box may be of any size, and so placed as to be supplied and emptied by a wheel and hand barrows in the easiest manner either by the end or top, or both being made to open. "If the box is made 8 feet by 5, and 3 deep, it will hold as many potatoes as will feed 50 cows for 24 hours, and these may be steamed in an hour." When the chest or box is placed by the side of the boiler, care must be taken so to regulate the fire or arrange the apparatus that the water from the boiler may not boil over into the box. This may be done by carrying the steam pipe up the out side of the box, and letting it enter near the top and then lead down and terminate beneath the false bottom. The boiling water by flowing up a pipe of some length, exposed to the air will be so far cooled as to prevent its running into the box.

Root Steamer.

Remedy for Poison.—A respectable cultivator assures us that a decoction of Thoroughwort (*Eupatorium perfoliatum*) externally and internally applied, is an excellent remedy for poison, either by ivy or dogwood. This plant and its uses are well described by Dr Bigelow in his *American Medical Botany*, vol. i. page 33. It has been long used in New England for various medical purposes, but we have never before heard of its application as an antidote to poison.

Remedy for Burns—The grease of the skunk, or American pole cat, we are informed, by the person, who communicated the above, is an efficacious application to burns.

Harrisburg Convention.—Delegates to this convention from 13 states assembled at Harrisburg on the 30th ult. Hon. JOSEPH RITZER, of Penn. was chosen President, Jesse Buel, Esq. of New York, and Frisby Tilghuan, Esq. of Maryland, Vice Presidents; and Redwood Fisher, Esq. of Philadelphia, and William Halstead Jr. Esq. of New Jersey, Secretaries. On the 31st and the two following days Committees were appointed and resolutions formed, which had a tendency to promote the great objects of the meeting.

M. Andre Parmentier, proprietor of the Horticultural Botanic Garden of Brooklyn, N. Y. has been presented with a diploma of corresponding member of the Linnæan Society of Paris and member of the Linnæan Branch of New York, through the hands of Dr Felix Pascalis, President of the Linnæan Branch of France in America.

Catalogues of Prince's Linnæan Botanic Garden, with large additions are now published.—They will be forwarded to any person, by dropping a line to Wm. Prince, Flushing, N. Y. post paid

Western Rail Road.—The Commissioners appointed to survey a route for a rail road from Boston to the Hudson river at or near Albany, consisting of Judge Mitchell, Col. Samuel M. McKay, and Col. James F. Baldwin, are to commence their tour of observation this week.

Swimming School.—The Trustees of the Humane Society of this city have voted to recommend to the inhabitants of Boston to avail themselves of Dr Lieber's instructions to acquire the art of swimming: and have appropriated \$100 to pay for such instruction.

Counterfeit one hundred dollar bills of the bank of the United States of the plate for the Branches are said to be in circulation.

The U. S. ship of the line, North Carolina, commodore Rodgers, arrived in Norfolk, from the Mediterranean, on the 28th. ult. She has been absent 28 months, and her officers and crew are in good health.

The navy of the United States, when all the vessels authorised to be built are afloat, as nearly every one of them may speedily be if required—will consist of 12 ships of the line, 20 frigates, 16 sloops of war, and seven other vessels, exclusive of those on the lakes. To man these will require more than 20,000 men, one half of whom must be seamen.

A Cotton Manufactory is about to be put in operation at Petersburg, Virg. by a company of gentlemen incorporated at the last session of the Legislature of that state. The necessary funds have been subscribed, and the site of the Factory purchased on the Appomattox river. This is the first establishment of the kind in Virginia, and we have no doubt it will be rapidly followed by others.

Manufactories are to be desired so long as they enable the public at large to buy cheap. They become a national evil as soon as they raise the price to consumers. In these two sentences, is contained the great principle which should regulate the establishing and maintaining Manufactories.

The skeleton of a mammoth has been found near Scheoley's mountain in New Jersey, by the workmen who were excavating the Morris Canal. It was about three feet below the surface, and in a remarkable state of preservation. One of the tusks weighs 140 pounds, and the grinders look remarkably fresh, though they have probably been buried a thousand years.

Stuart's full length portrait of Washington has been sold to a Russian gentleman for \$1000.

The trial of Strang for the murder of Mr. Whipple is concluded, and the prisoner found guilty.

The trial of Mrs. Whipple as an accessory commenced on Monday of last week, and determined on Friday in a verdict of acquittal. Mrs. Whipple was defended by Messrs. Tabor, Williams & Van Vechten.

Yellow Locust Seed.—Turnip Seed, &c. For sale at the New England Farmer office, a few lbs. Yellow Locust Seed, superior scarlet short top Radish, White Mulberry, 13 varieties of Turnip, Ginko or pickling Cucumber, &c. with a new assortment of ornamental flower seeds.

Agricultural Books.

Just received for sale at the New England Farmer office, No. 52 North Market Street, the following agricultural books in addition to those advertised July 30.

Parkinson on Live Stock—Lawrence's new Farmer's Calendar—Hayward on Horticulture—Suaclair's Code of Agriculture—Torrey's Botany—one copy of Madlock on the culture of Flowers, with beautifully coloured plates from nature—Nicol's Villa Garden Directory. American Gardener, &c.

Fresh Mulberry Seed.

For sale at the Farmer office, No. 52 North Market Street, genuine White Mulberry Seed, raised in Mansfield, Con. 1837.

Wool.

On Thursday, the 23d of August, at the lower division of the hall over the new Market House, under the direction of the *New-England Society*, will be sold, a large assortment of American fleece WOOL. Wool growers and others, who wish to benefit by this favourable opportunity for disposing of their Wool, are informed, that we are prepared to receive it, any time previous to the 17th of August, at which time the catalogue will be closed. COOLIDGE, POOR & HEAD, Auctioneers Boston, July 27, 1837.

Miscellaneous.

Sir Jonah Barrington remarks in his sketches, "in truth, the only three kinds of death the Irish peasantry think natural, are dying quietly in their own cabins; being hanged about assize time; or when the potato crop is deficient."

Some caution is requisite in passing our opinions upon strangers: a caution, however, which few of us adopt. At a public levee at the court of St. James, a gentleman said to Lord Chesterfield, "pray, my lord, who is that tall, awkward woman, yonder?" "That lady, sir," replied Lord Chesterfield, "is my sister." The gentleman reddened with confusion, and stammered out, "no, no, my lord, I beg your pardon; I mean that very ugly woman, who stands next to the Queen." That lady, sir, is my wife."

A shopkeeper at Doncaster, had, by his conduct obtained the name of 'the little rascal.' Being asked why this appellation had been given him, he replied, "To distinguish me from the rest of my trade here, who are all great rascals."

The being Prime Minister of England has often been attended with a dreadful fate.—Of 31, since the reformation [it may be inferred it was worse before]—13 have been executed—2 murdered—8 died in prison or exile—some committed suicide—and 4 are said to have saved themselves by sacrificing their Masters.

Reminiscence.—It is stated in the first of Caleb Atwater's notes on Ohio, that the first vessel ever launched by Europeans on the Upper Lakes, was built in 1680, by La Salle, a Frenchman—one hundred and forty-seven years ago! She was called the Griffin.

Increase of Population.—The Annual Report of the American Education Society states that the population of the United States is advancing at the rate of 1000 every day—365,000 a year.

Sheep.—About the time of the adoption of the Federal Constitution, it was looked upon as extravagant that the number of sheep in the United States should be estimated at one million.

There is a prospect of an abundant harvest throughout the England. A gentleman who had just returned to England from a journey through Russia, Poland, Sweden, and Denmark, states that the crops of grain are, if possible, more promising than in England.

Letters from Frankfort on the Main announce that the continual rains which have prevailed for some time, have given occasion to extensive business in corn. In Hungary the crop of fruit is completely destroyed. On several other points of Germany the winter wheats present a wretched appearance. The fine alone is in a thriving state.

Mr. Vaughan, the British Minister, paid to Mr. Clay, at the Department of State, on Monday, the second and last instalment, amounting to upwards of £600,000, payable by the Government of Great Britain, under the Convention of November last.

Silk Reel.—Any person having a model for a French Reel for reeling Silk from the Cocoon, will confer a favour on a cultivator, of silk by sending their address to the office of the Baltimore Patriot.

MAHOGANY.

The Honduras Almanac for 1827 gives a long account of the manner in which mahogany is cut and transported in Honduras, a British province on the Mosquito shore, Guatemala. The mahogany tree is of enormous size and height, and the branches spread to a great distance. A tree is not fit for cutting until it is 200 years old. This beautiful wood was discovered in 1559, and was first carried to England about the year 1700.—The first article made from it was a candle box, and the fine colour and beautiful polish were so pleasing that bureaux and other articles were soon manufactured from the same material. The mahogany cutters go into the forests in August, in gangs of from 20 to 50 each, and the "huntsman," having climbed a tall tree, surveys the surrounding country, ascertains where the mahogany abounds, and leads the gang to the place. Having felled a great number of trees, they cut a road through the thick forest to the nearest river, make bridges, build huts for themselves and cattle, &c.—About the first of December they begin to saw each mahogany tree, both trunk and branches, into logs. These logs vary in length and size—the largest ever cut in Honduras was 17 feet long, 5 feet 4 inches deep, and weighing 15 tons. After the sawing is completed, the logs are reduced by the axe, from the round to the square form, to lessen their weight, and prevent their rolling on the truck. When the dry season commences, about the first of April, they begin to draw the logs to the river. The distance is generally from 6 to 10 miles; each truck requires 7 pairs of oxen, 2 drivers, 2 or 3 to cut food for the cattle, and several loaders. The heat of the sun is so great that every thing must be done by night. The teams start from the river at 6 o'clock in the evening, and return with their loads the next morning; the drivers after throwing the logs into the river, retire to rest. Thus goes on the routine of trucking during the months of April and May. This process of drawing down mahogany to the river, presents an extraordinary spectacle. Six trucks and 40 yokes of oxen occupying the road for a quarter of a mile—the drivers half naked, and each bearing a torch light—the wildness of the forest scenery—the rattling of the chains—the sound of the whip echoing through the woods—all this activity and exertion so ill corresponding with the silent hour of midnight—make it wear the appearance of some theatrical exhibition. About the end of May the rains commence, the roads are impassable, and all trucking ceases. After the rivers are swollen, the logs are floated down a distance of 200 miles, until they are stopped by a boom, where each gang separates its own cutting. The logs are then brought to the wharves, taken out of the water, and the surface made smooth by an axe, when they are ready for shipping.—*Hamp. Gaz.*

Hard Soap.—To make hard soap Soda should be dissolved and leached through quick lime.—Six times as much olive oil or tallow are to be added as the quantity of Soda used. The lye is then to be gently boiled, and the ingredients will unite into a hard white Soap, if the carbonic acid be properly taken from the Soda. If a quantity of rosin be added it forms the common yellow bar Soap. To make the soap marbled, soap makers add copperas, cinabar, &c. to it before it is made into cakes.

The Albany Argus speaks in favorable terms of "Pope's improved hand threshing machine." It combines simplicity and strength in its construction, and with two men at the wheel, and one to feed the machine will thresh five bushels per hour, throwing out the grain thoroughly. The cost of it is not one third the average cost of the Scotch and English machines. It has been highly approved of by the Massachusetts Agricultural Society, in all instances where an opportunity has been afforded to test its practical utility.

Domestic Economy.

Rice Jelly. This is one of the most nourishing preparations of rice, particularly for valetudinarians or convalescents. It is thus made: Boil a quarter of a pound of rice flour, with half a pound of loaf sugar, in a quart of water, till the whole becomes one uniform gelatinous mass; then strain off the jelly and let it stand to cool. A little of this salubrious food eaten at a time, will be found very beneficial to those of a weakly and infirm constitution.

To cleanse the Teeth and to improve the breath. To four ounces of fresh prepared lime water add a drachm of Peruvian bark, and wash the teeth with this water in the morning before breakfast, and after supper. It will effectually destroy the tartar, and remove the offensive smell from those which have most decayed.

Vinegar of Roses. This fine vinegar is made by putting a quantity of fresh rose leaves loosely into a jar or bottle, pouring upon them the best white wine vinegar so as to fill it up to the height first occupied by the leaves, if, for example, the jar be thus apparently filled, there will be still room enough for the proper quantity of vinegar; let it remain for three weeks in the sun or some other warm situation, when it may be strained off and passed through a cotton or flannel bag. If it is not sufficiently fine, after having been strained, to put up into bottles, it is to be cleared in the usual way, either by means of isinglass or a little alum-water. It is commonly kept in large bottles; which should be well corked and kept in a dry place. A lump of refined sugar should be put in to each bottle. In this way are also to be made vinegar of gilliflowers, elder flowers, &c. &c.

Saxony Sheep.

On Friday the 24th August next, at 3 o'clock P. M. at Brighton near Boston, will be sold by public auction, a choice stock of about 100 Saxony Rams, just imported in the brig Comet, Capt. Meef, from Hamburg.

These sheep were selected from the purest blood in the kingdom, and will be found at least, equal in point of fineness of fleece and symmetry of form to any heretofore imported. The sale will be perfectly free and unlimited.

Samples of the wool from different parts of each animal may be seen at No. 46 Central street, or at the office of the auctioneers, at any time previous to the sale.

J. & A. Fales' Patent Hoes,

Constantly for sale by French & Weld, 31 & 32 South Market street, sole agents for vending the same.

The FARMER is published every Friday, at \$3.00 per annum, or \$2.50 if paid in advance. Gentlemen who procure five responsible subscribers are entitled to a sixth volume gratis.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

BOSTON, FRIDAY, AUGUST 17, 1827.

No. 4.

AGRICULTURE.

MACHINE FOR SOWING TURNIPS

a a Wheels attached to the axle which turns with the wheels.

b Band passing over two drums g g.

c c c Rakes which cover the seed.

d d d Cylinders which contain the seed.

e e e Ploughs which furrow for the seed.

f The draught.

The centre of the machine may be used as the entire machine for one row, or the outside cylinders may be added where much work is to be performed.

THOS. G. FESSENDEN, Esq.—Inclosed is a draught of the Drill for sowing the various description of Turnip Seed, which are alluded to in the New England Farmer, vol. i. page 67, and vol. ii. page 285.

I have foreborn any communication concerning it until I had sufficient opportunity to test its utility by actual experience.

The quantity of ground I usually sow with turnips is about quarter of an acre, which after the ground is raked I can sow in forty minutes.—The drill I use is calculated to sow but one row at a time, which is furrowed, sowed, and covered, at one operation, as fast as a man can walk backward. For a farmer who has a large stock, or for him who is in the practice of sowing for the market, it must be a great saving of labour, and that at the time when labour is most in demand.

I am persuaded that with the drill which sows but one row at a time, a man will in one hour, sow as much ground as two men could sow in a day without any drill; or as is commonly practised, by dropping the seed with the fingers. *He will not use more than half the quantity of seed*; and it will be sowed so much more even as will save half the labour also in thinning them.

In constructing the machine the wheels were calculated at eight inches diameter, and being firmly fixed on the axle, at every evolution of the wheels, the cylinders containing the seed are moved by the revolving band to perform also one revolution. On the thirds of each cylinder are holes

to drop the seed, calculating the distance at which they would be dropped, would be determined by the diameter of the wheels—but experience shows that the seeds do not drop *precisely* when the hole is down, but are dropped in continuity as the cylinder proceeds, and equally while the holes are descending or ascending as they pass over the aperture.

Satisfied of your zeal to promote the interest which you patronize, and of your judgement of the means you advocate, I place this at your disposal without hesitation.

And am, sir,

with high estimation,

your humble servant,

W. JACKSON.

Plymouth, August 8, 1827.

WHEAT IN MASSACHUSETTS.

For about thirty years immediately preceding the year 1813, few attempts were made to raise wheat in parts adjacent to the sea coast in Massachusetts; and a belief generally prevailed, that it could not be made to thrive there, owing to peculiarity of climate or some other inexplicable cause. Since that time, however, it has been considerably cultivated.

Mr. Dudley Hardy sowed, on three quarters and an half quarter of an acre of land, in Brighton, near Boston, twenty-eight quarts of spring wheat originally from Londonderry. The land the preceding year had been planted with Indian corn.—It was ploughed in the fall; and in the month of March, before the frost was all out of the ground, was ploughed over again two or three times, and then harrowed with an iron tooth harrow. The grain was prepared by steeping it in ley made of ashes twenty-four hours, and on the 7th. of April sowed, and harrowed in with the harrow. "After this," says Mr Hardy, "I bruised the ground smooth with a brush harrow." The twenty-eight quarts produced eighteen bushels, weighing sixty pounds a bushel. One bushel, ground and bolted gave forty-six pounds and an half of flour. Mr. Hardy thinks, that spring wheat should be sowed in the month of March, if the frost will permit.

Mass. Agricultural Repository, vol. iii. p. 31.

Mr J. Lowell gives the following account of a trial of the same kind of wheat.

"I had but one small piece of ground in a proper state to receive wheat. It measured one third of an acre. The soil was very thin over a bed of gravel, extremely subject to drought, and incapable, as I thought, of bearing a large crop of any sort. Potatoes had been cultivated on it for two years preceding. It had been twice ploughed the fall before, after the potatoes were dug. In the spring, four horse cart loads of horse dung were spread u on it and ploughed in. On the seventh day of April, I sowed upon it three quarters of a bushel of Mr Hardy's wheat. This wheat was of small size, and rather shrivelled. It is said to be the same known and cultivated as Londonderry wheat.

"The crop looked extremely well; none of it was blighted; and on the second of August it was reaped. It weighed from fifty-six to fifty-eight pounds the bushel."—Massachusetts Agricultural Repository, vol iii. p. 216.

The same publication, pages 217, 218, contains the experiments of Hon. J. Quincy, and Hon. P. C. Brooks, which, though somewhat less successful than the preceding, (Mr Quincy having raised fifteen, and Mr Brooks fourteen bushels to the acre) yet as the grain was of good quality, and free from blast or smut, establish the fact that the climate of Massachusetts is not unfavourable to the cultivation of wheat.

Bezaleel Taft, Jr. Esq. of Uxbridge, likewise states in substance, that his father, about fifteen years since, procured a bushel of spring wheat from Barry, on the Onion river, in the state of Vermont. The produce of this was fifteen bushels. He continued to procure his seed from that quarter for several years, but at length sowed the seed of his own growth prepared by washing it clean, stirring it well in two or three changes of water. After washing it was soaked about twelve hours in a weak ley; and after turning off the ley, about two quarts of slaked lime was stirred into a bushel of wheat.

The ground selected for the cultivation of wheat was such as would be most sure to produce a good crop of Indian corn, and the wheat was sown early in the spring as the soil could be stirred and remain light.

Five pecks of seed were sowed to an acre, and the crops have been from 12 to 22 bushels; and about sixteen upon an average to an acre.

This communication was dated the 19th November, 1814, and the writer says, "For the last three years, I believe this town has produced annually about a thousand bushels, and the last season we had at least four times as many bushels of wheat as of rye from the same numbers of acres, in the same state."

The writer considers wheat as more favourable to a future crop of grass than rye or oats, as it shades the grass less; and when the crop is removed, it is not so apt to be scorched, having been more accustomed to the rays of the sun. In that quarter of the country, wheat is invariably washed before it is sent to the mill, not to free it from smut or mildew, but from dust which adheres to it in consequence of the sandy nature of the soil.—He says, that "an active man will wash ten bushels in two or three hours. Care ought to be taken not to leave it remain longer than necessary in the water. We usually dry it on blankets or sheets in the sun. Care should likewise be taken not to have it get too dry, as the flour in that case is not so nice. One day's sun is sufficient to dry it in the summer, and two in the fall. If suffered to become too dry, the hull or bran is brittle, and cuts to pieces in grinding, so as to mix with the flour. When only dried sufficient to prevent its clogging in the mill, the flour separates much better from the bran, and is far preferable for use."—Mass. Ag. Repository, vol. iii. pp. 218, 219, 220.

Mr John Venks gives a statement of his experiment relating to the same subject. His ground was two acres, and seed four bushels. A part of this seed was soaked in weak ley, and part in sea water, and the parcels kept separate. Both were soaked eight hours, the water drained off, the wheat spread on a tight floor, lime sprinkled on it and raked over, until it was all covered with the

lime and dry, and appeared all over as white as rice. There was no discernible difference in the growth of the grain soaked in sea water, and that soaked in ley. One peck of this seed was soaked in weak ley only an hour, and then limed and sowed by itself upon a quarter of an acre adjoining the land already sown, part of the two acres. This was much blighted, and produced little in comparison with the other part of the two acres. The produce of an acre and three quarters, which was sowed with the wheat longest soaked was forty-four bushels, weighing sixty-two pounds the bushel when first sowed. The land on which this grew was a good dark rich mould, and herds'-grass and clover was sowed with the wheat. The grass was well grown, and covered the ground when the wheat was reaped, and the writer supposes that if no grass had been sown, the crop of wheat might have been better.—*Agricultural Repository*, vol. iii. p. 221.

In the spring of 1814, Gorham Parsons, Esq. sowed four acres and thirty-two rods with four bushels; ploughed in eight loads of manure to the acre, and laid it down with herds'-grass, red-top, and red clover. It produced eighty-four bushels and an half of wheat, besides a good crop of grass, which was mowed in September. Mr Parsons thinks that his crop would have been better had double the quantity of wheat been sown, or two bushels to the acre.—*Agricultural Repository*, Vol. III. p. 271.

In 1816 J. Lowell, Esq. observes, that "I selected a piece of land, measuring nearly three quarters of an acre; its quality is but indifferent, a light thin soil on a gravelly base. It had been leased to different tenants for six years, and was very much exhausted, having been constantly in tillage, and never surcharged with manure.

"I sowed only one bushel of wheat, at least one half less than I should have sown; it was steeped in brine for three days, limed, and sown with one bushel of plaster of Paris. The crop was sixteen bushels of very fair, full and heavy wheat; that is, about twenty-two bushels to the acre."—*Agricultural Repository*, Vol. IV. p. 272.

Mr Justin Ely writes to the President of the Massachusetts Agricultural Society as follows:—"The largest crop of winter wheat was raised in Springfield last summer (1816) that is known ever to have been raised in this vicinity, and perhaps larger than was ever before raised in New-England.

"Four acres of land, one of the house-lots in Springfield-Street, belonging to the distillery company, three years ago last spring were English mowing. It was mowed and ploughed up and planted with Indian corn, and dung put in the hills. The crop was abundant. The next spring it was covered with very rich manure from the distillery, and hemp seed sowed thereon. The crop was large and heavy. The land was then ploughed twice and sowed with the bald wheat, one bushel and three quarts to the acre. The produce was two hundred bushels of good, clean, heavy wheat, from the four acres.

"About half an acre of the hemp was not pulled with the other hemp, but was suffered to stand till the hemp seed was ripe, whereby the sowing of the wheat, on that part, was delayed too late in the season, which diminished the crop of the wheat on that part, six or eight bushels, as supposed.

"It is the opinion of many people, that, the un-

precedented cold and drought of the last summer checked and retarded vegetation so far as to prevent the destruction of the crop by blast and other causes, and that if the last summer had been as warm and wet as usual, the whole crop would have been blasted and lodged, so as to have been wholly ruined."

For further experiments relating to the culture of wheat, see *Massachusetts Agricultural Repository*, Vol. IV. p. 195. 267. 278. 315. Vol. V. p. 65. 192. 265. Vol. VI. p. 239.

Mr Payson Williams, of Fitchburgh, Massachusetts, gives the following account of his method of raising a crop of spring wheat, being twenty-eight bushels and thirty quarts on one acre and an eight part of an acre, for which he received the Massachusetts Agricultural Society's premium of forty dollars, October 1819.

The land on which the wheat was sown, was in 1818 planted with potatoes, (for one acre of which I obtained your premium) which, after harvesting, was ploughed a short time before the setting in of winter. In the spring of 1819, as soon as practicable, (after spreading on six loads of fermented manure) it was again cross-ploughed—26th April sowed on the furrows two bushels of what is known by the name of the *Gilman* wheat, (which I procured of the Hon. P. C. Brooks of Boston) on one acre and twenty square rods, and cross-harrowed the same, following the harrow at the same time with the clover seed, which in turn was cross-harrowed in. The wheat before sowing was washed in water until perfectly clean, then immersed in a liquor, or ley, made in the proportion of four pints of water to every pound of wood ashes, then add one pound of unsacked lime to every bushel of seed, as recommended by M. Du Hamel. When the wheat plant was out of ground two inches, I sowed on a part of the field plaster of Paris at the rate of ten bushels to the acre, which I never have been able to discover, has had the least effect, (I had the like ill success in the use of a ton, on various parts of the farm.) The amount of the wheat by actual measure, was twenty-eight bushels and thirty quarts. It may not be improper here to state, that on the most close examination, I could not discover one kernel of smutty grain in the whole crop; and had it not been for the ravages of the grasshopper in this field (in many parts of which they cut off one fourth part of the heads, which were of course lost,) there would probably have been thirty four bushels. I esteem this kind of wheat a valuable acquisition to this part of the country. The grain weighing sixty-two pounds to the bushel, and yielding at the mills in this quarter, forty-five pounds of flour, in quality equal, I think, to the best Baltimore."—*Massachusetts Agricultural Repository*, Vol. VI. p. 32. 3.

Extraordinary Yield.—On the 24th inst. in a field of rye growing upon the farm of Gen. A. Forbes, in Windsor, Vt. were found 73 stalks of rye, growing from one root, the produce of one kernel, each stalk having a fair head. The heads were shelled and found to contain 3000 kernels!

A coat of mail has been found by a farmer in Vermont, while ploughing his field. The body is composed of iron rings linked into each other, about one eighth of an inch in diameter. The collar is made of brass rings, so closely interwoven as to be perfectly stiff.

From the Norfolk Republican.

Messrs. Fisk, Hayward, and Phillips, Commissioners appointed by the State to examine the different routes for a Rail Road to Providence, started from the Norfolk House on Wednesday last, and commenced viewing. There are 2 or 3 different routes which will be shewn them, taking about half a mile westward of Mr Davenport's house, near the Blue Hills, as a point to approach, which I understand is on an air line from Boston to Providence. I was with the commissioners viewing one of the routes to this given point, and was astonished to find, by starting from Mr John Heath's farm in Roxbury, and continuing a course with Stony Brook, passing near the estates of John Lowell and John Amory, Esqrs. thence through to, and crossing Dedham turnpike over a part of Dedham and Dorchester, and near the Dedham old factory to the point above alluded to, near Mr Davenport's, which is about nine miles from Boston, that this distance could be obtained without the smallest difficulty. In coming to this point, I have supposed the commissioners had in view that on the proper course from this point the extensive level meadows by which a level route may be obtained some 8 or 9 miles farther, which would make a distance of at least 18 or 20 miles from Boston, or half the distance to Providence without meeting a ten foot immediate rise the whole way. Beyond 12 or 20 miles on this or any other route, I know nothing of the situation of the country. RAIL ROAD.

Roxbury, Aug. 11 1827.

Very flattering accounts of the progress of arrangements for the establishment of Rail Roads, Canals, and Highways, reach us from various States. They exhibit the union of Public Spirit and Individual Munificence.

De Roos's Travels.—We are requested to state, that the Honourable Mr De Roos's Personal Narrative of Travels in the United States, with Observations on the dockyards and the Maritime Resources of America, Emigration, &c. &c., and containing numerous illustrative plates, will be ready for delivery on Saturday, the 16th. inst.

London paper, June 17.

Another Brick Building in rains.—On Wednesday afternoon during the gust, a two story brick building erected in the north west corner of Greenwich and Leroy streets, fell down and is in complete ruins. We understand that the work had been suspended for some time in consequence of the death of the owner.—*Evening Post*.

On the subject of the flimsy manner in which some of the buildings of New-York are erected, the Times observes "We have seen erected within the last 6 months a number of buildings with brick walls of four inches thickness, and have seen these very walls propped up by timbers from the outside, until the mortar should become sufficiently hardened to hold the rookeries together.

Sir Jonah Barrington says in his Sketches, that he once saw a Bishop play the fiddle at one of the public concerts of the first Lady Westmoreland, in Dublin Castle. The editor of the National Gazette has seen several of the Judges of the High Court of Sessions of Scotland, dancing highland reels at the Duchess of Gordon's balls, in Dumbreck's hotel, Edinburgh.

From *Memoirs of the Mass. Ag. Soc. for June 1827.*

ON THE CULTURE OF LUCERNE.

There is no branch of agriculture which has been more neglected in the State of Massachusetts than that of the cultivated grasses. Till within a few years our farmers rarely sowed any grass seeds, but those of clover and herd's grass seeds, or timothy, as it is called in the middle States.

If the farmer should say, that they are good enough for all their purposes, our reply would promptly be, how can you know that until you try others? That there are better grasses than either of them for certain purposes, and on certain soils, we know.

The objections to red or Dutch clover are numerous. It is apt to be winter killed, much more so than the plant we shall recommend in its place; in strong soils, it is too luxuriant; its stalks are coarse, and are rejected by all but very hungry cattle; its leaves are very apt to fall in drying, and every time the hay is removed; lastly it lives but two years; if it did not sow itself, when left to stand till herd's grass is ripe, there would not be a trace of it the third year. These are serious objections. There are some objections to herd's grass, though smaller in degree. It is not well adapted to dry soils; it is a late grass, gives no early feed, and no after math or after feed to any valuable extent. We shall speak of its partial substitute hereafter,—we mean the Orchard grass. This grass has been the subject of discussion these thirty years, but it is only within ten or fifteen years, that its merits have been admitted, and that it has been cultivated for some purposes in preference to Herd's grass. The Connecticut farmers, we believe, were the first who cultivated it in New England, and John Prince, Esq. was the person who first introduced it into this vicinity. It may be now considered as having fairly overcome prejudices, and when its seeds can be easily procured and at a cheap rate we shall see as many fields of it as of herd's grass; the latter, however, will always be preferred in low lands. It is not to us extraordinary that it did not make its way earlier. Our farmers have a contempt for every thing new, especially if it is proffered by "look farmers." It was more than forty years after "*Spinach*," was introduced into the gardens of the opulent before you could buy it at Boston market, though it had been a regular and important article at Covent Garden, and in the Paris markets, for more than one hundred years. The disgrace of being so slow to receive valuable novelties is not confined to our farmers and gardeners. The medical faculty of Paris proscribed as poisonous the *potato* one hundred years after that plant had raised millions of vigorous, and athletic troops, who, under Marlborough, had beaten the finest armies of France! Let us delay our translation one moment more, by saying that even now the *Salsify* can hardly be said to be a regular marketable article; that the *Rhubarb* was twenty years in coming into favor, and that the *Sea Kale*, the favorite vegetable of Great Britain, cannot find one intelligent cultivator, who will tempt the Boston gentlemen with this luxury.

As Orchard grass is now admitted to be worth cultivating, we may hope that Lucerne, or as the French call it, Luzerne, will have a fair trial as a substitute for clover. Will Lucerne bear our climate? It will; it is hardier than clover. The late Mr John Gore had a field of it at Dorchester

nearly twenty years ago; its early, vigorous growth attracted notice; and it endured many years. The writer of this article received a pint of the seed of Lucerne from Florence, under the name of Lupinella, by which it is known in Italy. He sowed it five years ago; not a plant has ever died. His experience enables him to state, that it starts earlier than clover, grows more rapidly. On this day, April 30, 1827, it is nine inches high, and several inches higher than clover by the side of it. It has been cut every year four times; its stalks are not so coarse or woody as those of clover; its leaves are more numerous; it is eaten greedily by cows and horses, both green and dry. Such is the experience derived from the culture of two rods square only. An half acre has now been sown with it the present year. We shall now proceed with the translation of the Abbe Rozier's article, under the head of Luzerne.—France has cultivated this grass for a century at least, and no man could be a better judge of it than this learned agriculturist.

Translated and abridged from the course of agriculture of the Abbe Rozier.

"OF THE SOIL ADAPTED TO LUZERNE."

"Many authors assert that it succeeds in all sorts of soil. This assertion as a general one is true, but it is very false as a particular one. I have often said in the course of this work, that you may lay it down as a safe rule in agriculture, that the roots of plants will show what sort of soil they require. The root of the Luzerne is (what we call) tap rooted: has few fibres (or small roots) and runs directly down as soon as it finds a soil adapted to it. It is not uncommon to find plants of Luzerne whose roots are six, and sometimes even ten feet long. It is clear from this fact, which I certify to be true, that this plant would not succeed, or would grow poorly in a soil purely stony or sandy; in a strong, clayey, compact soil, or even in a vegetable soil whose thickness does not exceed from six to twelve inches, and which rests upon a basis of gravel or clay.

The roots in that case cease to run down, and at the least drought the plants suffers, languishes, and afterwards perishes. The great point is to seek a deep soil. The best soil for it, doubtless, is one that is both light and substantial. Intervale lands have the requisite qualities, rich sandy loams, and generally all lands which are situated at the foot of hills or mountains, because they are constantly enriched by the earth brought down by rains. On the quality of the soil depends the duration and beauty of the Luzerne. In suitable soils, when none of the accidents to which we shall advert happen to it, it will last in southern provinces (of France) from ten to twenty years. Its duration diminishes in proportion as the soil is less adapted to it, and sometimes it will not last more than four or five years or even less; in this case it is hardly worth while to sow it, except as an alternate crop, or to restore a field exhausted by over cropping with wheat."

[NOTE.—Though the Abbe Rozier would seem to restrict the culture to the best soils only, yet he admits that other writers contend that it is fitted for any soils; and the land on which we have seen it flourish here is not remarkable for its goodness; any good loam easily penetrated by its roots would suit it; but no doubt, a plant so luxuriant in its growth, and with such a quantity of

leaves, could not sustain drought on a gravelly or chryey soil.]

Of the choice of seed and the time of sowing.

The seed is usually gathered only from old fields of Lucerne, which are about to be destroyed, and in that case, you leave it to dry on the stalk till the first frost. As the seed vessel or pod of this plant is in a spiral form, and opens with difficulty, the farmer is not pressed as to the time of thrashing out, or harvesting the seed. In the northern parts of France the grass should not be cut in the year in which it is intended to gather the seed; but in the south of France you may make a crop of early hay, and the second crop will ripen its seeds. [Experience has shown, that we may in America take a first crop of hay, and that the second growth will ripen its seeds in great abundance.] It is very important, that the seeds should be thoroughly ripe, otherwise they will not vegetate. The seeds should acquire a brown colour, or else they will come up thinly, and not cover the ground. When you judge that the seed is ripe enough, you cut it in a dry day, and leave it exposed to the heat of the sun several days running, after which, it is carried under cover, in order to be thrashed on some dry day in the following winter. I have remarked that the pods open with great difficulty, and that the seeds come out very hardily. You must not then be weary in thrashing it thoroughly, in winnowing it often, and in thrashing that which has been winnowed—in short, it requires patience to separate this seed; of course, the winter, as a season of leisure, is chosen for this purpose. You must take care not to throw the chaff on the dung heap, for many seeds will still remain, and if carried out with the dung will grow and be difficult to eradicate, or destroy. Many authors maintain, that the seeds of this plant are not good for sowing after the first year, but the Abbe de Rozier's experience was to the contrary, though he thinks it safest to sow new seed, but by no means to throw away old seeds.

Of the proper time of sowing Luzerne.

To point out a precise moment would lead to error. It depends on the climate and the season. In the south of France there are two seasons, one in the course of September, and the other at the end of February, and so on into March, and even later, even till the middle of April. The sowings in September gain one year; the next season following the sowing, you cut the Lucerne like all other grasses; in that case (of fall sowing) the plant flowers later the first year, and you cut but one crop. [In the northern parts of the United States we cannot sow in autumn; the plants would be winter killed.] Mr Rozier says, that in the northern parts of France, the sowing must be governed by the season and may be done as soon as the frosts have ceased, and should not be regulated by Saint's days. We should not be in haste to take a crop, and it is prudent to take but one the first year, in order not to exhaust the plant, and especially to permit it to grow so thick, as to stifle all pernicious weeds. When the Lucerne has once taken hold in a field, it demands very little care. Some recommend thin sowing in order that the root may have room to send up many stalks. Mr Rozier on the other hand advises to sow it thick because all the seeds will not grow.

and the strong plants will destroy the weaker ones, but he admits that too thick sowing is injurious. "I think (says Monsieur Rozier), that it will succeed, if sowed with wheat, but I have never tried it." [We know that it will.]—Editors. "We cannot estimate exactly the quantity of grain estimated by weight which should be sown on a given space of ground; so much depends on the nature of the soil, and the time of sowing. If sown in September, it should be sown thicker, for it has to encounter ants, birds, and overflowing rains of winter. In spring it has fewer risks to encounter. [In our country, at least, in New England, fall sowing will never answer.]—Editors. You may, however, say, that upon a surface of four hundred square toises [one third of an acre] you ought to sow something more than one sixteenth of a hundred weight, (say seven pounds.) This would be at the rate of twenty one pounds to the acre. If you can procure good seeds from a distant province, the plant will gain by the exchange. The planters in the north of France were for a long time persuaded, that it was absolutely necessary to procure their seed from the south, and they were right, because the plant had not then become acclimated, but at present, these distant transportations do not take place. I am inclined to think, says Rozier, that at this moment it is better to sow northern seed in the south. I repeat it, change of seed is useful in the case of Lucerne, but not as much so as for wheat crops."

[We add, that in Massachusetts, the Lucerne sows its seeds as freely as clover.]—Editors.
(To be concluded next week.)

LIME.

The facts we have lately witnessed of the beneficial effects of lime in agriculture, impress us with the belief that a greater revolution will be produced by the general introduction of lime as a manure, than by gypsum or any other fertilizer of land that has ever been used or known. It has for some years been used in the lower counties, and we have seen and heard of its great benefits, but they have not been suitably noticed or made known. The good effects of lime on land in this country is more remarkable than in the places we have mentioned. A neighbour of ours spread lime over a strip of his corn field, and the difference in the appearance of the corn which was limed in comparison with that which was not is indeed truly astonishing. Every hill of corn which was limed may be most distinctly seen by its rank luxuriant growth. The stalks are nearly twice the height of the other corn, and in other respects proportionably strong and vigorous.

Last year we limed part of a garden, the effect was striking and palpable. This year we did the same with another, and vegetation in it is almost too rank to be controlled and kept in order.
Philadelphia Miner's Journal.

Effect of hot water in raising flowers.—In *Thomson's Annals of Philosophy*, it is said that, if flowers which have been 24 hours out of water, and are decayed, that if plunged into hot water, as the water gradually cools they become again quite fresh. This fact, while many discredit it, has long been familiar to those who live in the vicinity of hot springs; and who have remarked, that decayed flowers, plunged into the waters of the springs, became again fresh and beautiful.

CHOLIC—CHOLERA MORBUS.

It should not be forgotten that a burnt cork, pulverised and mixed with molasses and brandy or other spirits, will give almost immediate relief from the diseases so common to this season of the year. In the absence of cork, a crust of bread is a tolerable substitute. The business is best performed by covering the cork entirely in the hot embers, and it will be charred there in about ten minutes.—*Mid. Gaz.*

SINGULAR ORGANIC RELIC.

Capt. Bell, of the schooner *Three Sisters*, of Polly Landing, Accomac county, Virginia, has brought from that neighborhood a very curious skull, with tusks and teeth resembling ivory. It is in a complete state of petrification, and weighs fourteen pounds. It was found by Mr Cropper on the sea shore, and it is a matter of uncertainty whether it washed up by the surf, or disintegrated by the waves. The latter is probably the fact.—The specimen has been referred to the order of cetaceous animals which are herbivorous, or feed upon vegetables, such as the *Manati*, the *Dugong*, and the *Reptina* of Zoologists. But Dr Michill, who received the specimen from the finder, thro' Mr H. P. Havens, is inclined to consider it as having belonged to some antediluvian creature, who no longer exists in a living state, but has, like many others, become extinct in the course of age. By him Mr Cropper has been exhorted to make search for other parts of the skeleton.

N. Y. Et. Post.

POTATO.

Not long since a paragraph was copied from the "New England Farmer" into the *Advocate*, recommending it to farmers to pluck the blossoms from potatoes for the sake of improving the root. The practice is recommended there by the result of the author's experiments; and the general principle on which it rests is well established, and extensively acted upon in some kinds of cultivation; particularly in dressing the vine. There the luxuriance of the growth is checked, by taking off the shoots, and thus the sap and juices, instead of being expended in producing a useless extension of the branches, is turned to the useful purposes of enlarging, maturing, and enriching the fruit. Plucking the fruit would doubtless leave more nourishment to be supplied to the branches.

In the potato it is the bulbous root we value and use—and this, it is very reasonable to suppose, will receive a larger share of the nutritive matter gathered from the earth and atmosphere by the plant, if the balls, or apples, do not take it up. But the object of this paragraph is principally to direct the attention of your readers to a fact that often renders it unnecessary to be at the trouble of plucking the blossoms.—They often fall off themselves, a little below the germ, so that no apples or balls are found. I believe most of the varieties of the potato now cultivated, usually do so. In looking over mine, I find only a few hills on which apples are forming. I think it was otherwise with most kinds of potatoes cultivated when I was a boy. I am sure my potato yard will not supply the means of such obnoxious peltings as boys used then to give one another with potato balls.

It is necessary also to be aware of the fact that potatoes often spontaneously shed the germ of the

apples with the flowers; else experiments may prove deceptive—as no other benefits can be expected from plucking, than follow from this spontaneous failure of the apples.—*American Advocate*

ELDER WINE

The wine, made from the elder, is in general use in England, and is said to be excellent, and to constitute the basis of a most healthy and delightful beverage. In this country, it is unknown. Will not some gentleman from that country furnish a recipe for making this Wine; and also for compounding the after mixture. The berries abound in this country and are suffered to drop to the ground unmolested.—*N. Y. Daily Adv.*

RECIPE.

To make Elder Berry Wine.—One bushel, when picked from the stalks, produces seven gallons, or upwards, of berries—put these to seven gallons soft water; after standing forty-eight hours, put them into the copper, let them boil one hour, then press the juice through a coarse cloth, then put the liquor into your copper again, with twenty pounds of raw sugar, half a pound of Jamaica ginger, bruised, one ounce of cloves, and one ounce of allspice. Boil the whole together one hour—then put it into a tub, and when cold enough, add some good barm, or yeast, spread on a toast, and in two days, put it all into a cask, and lay the bung lightly on for two months; then add one quart of brandy; this wine will keep, if required several years.

CORNISH MINES.

At a time like the present, when the public attention is fixed upon such stupendous undertakings as tunnels under the Thames and Mersey, the following extract cannot fail to be interesting.—It is transcribed from the *Selector*, or *Cornish Magazine*:

"*Tin Mine.*—On the shore, about half a mile towards the old fishing village of Newlyn, is the spot where a tin mine was worked under the bed of the sea; its name was the Wherry Mine, and as its history exhibits the ingenuity and adventurous spirit of the Cornishmen, it will please the reader. This mine was first attempted to be worked about 1700, when, at low water, there being some appearance of metal, a shaft was sunk some way into the rock; but the difficulty of excluding the water caused its abandonment.—However, about 1778, a common miner of Breage boldly began again, and with a very small pittance, a good head and hard work pursued his plan.—His difficulties were indeed great—the distance of the rock from the dry beach at high-water above 100 fathoms. At first, work could only be done at low water; and at high spring tides, nineteen feet of water was above the rock. In winter, the heavy waves prevented all operations. After 3 years, a pump was fixed in an upright, square wooden tunnel or shaft, twenty feet high, cemented to the rock, and reaching above the tide; then machinery came into action. Thus, with great perseverance, the ore was raised, and proved so rich that profit crowned the endeavour, and added courage to those who had assisted with money the genius of the old miner.

In 1791, Wheal Wherry was worked about five fathoms deep, with eighteen feet breadth of working. Such success and great indications of metal, made the work proceed briskly, as much as the tides and lost time of winter would allow; and in

the summer of 1792, it was said that £3,000 worth of tin was obtained from this extraordinary mine. There was a steam-engine erected on the shore with a wooden stage or causeway, above high water, to the rock, on which the working rods were conducted to the mine pump, and this bridge served to convey the sacks of ore.

Imagine (says Dr. Maton) the descent into a mine through the sea!—the miners working seventeen fathoms below the waves, the rod of the steam-engine on shore, 120 fathoms in length the water always draining through in every part, and the roaring of the sea continually heard! Those scientific gentlemen, J. Hawkins, Esq., and D. Gilbert, Esq. valuable members of the Geological Society, have ably written on this mine; the former concludes thus:—"In this manner the mine was conducted, and ore to the amount of £70,000 was raised from it. The treasures were not exhausted at its close, which occurred in the year 1798; and the conclusion was as romantic as its commencement. An American vessel in Gowanus Lake broke from its anchorage, and striking against the stage, demolished the machinery, and thus put an end to the adventure, which both in its ingenuity and success was probably never equalled in any country.

The adventurers were awed by the expense of repair, with the perpetual danger and risk; so all was removed, and no trace at this time is visible."

NEW ENGLAND FARMER.

BOSTON, FRIDAY, AUGUST 17, 1827.

LAYING DOWN LAND TO GRASS.

Young's Farmer's Calendar, under the date August says "This is the best season of the whole year for laying down land to grass; and no other is admissible for it on strong, wet or heavy soils. Spring sowings with corn [grains.] may succeed, and do often, but that they are hazardous I know from forty years' experience."

The mould of the ground, which is laid down to grass, should be made very fine, as the seeds being very small, may otherwise be covered too deep, by falling below, or be scorched by lying above large clods. Like other seeds they require a due degree of moisture to cause them to vegetate, and therefore should not be left exposed to the sun's rays without being covered: for unless rainy weather follows immediately after sowing, many of the seeds will not vegetate. On this account it is well to harrow the ground immediately after sowing, with a light close-toothed harrow, and it should then be rolled with a wooden roller, which will make the surface even for the sycle, and prevent the seed from blowing into patches. No one circumstance so effectually ensures the vegetating of these small seeds, as sowing them as soon as possible after the ground is ploughed, while the soil remains moist. It is always good economy to lay down rich and not poor ground to grass.

Sir John Sinclair says, "it is a bad system to mix seeds of different sorts of grass before sowing them, in order to have the fewer casts. It is better to sow each sort separately, as the expense of going several times over the ground is nothing compared to the benefit of each sort equally distributed. The seeds of grasses being so light, ought never to be sown in a windy day, except by machinery, an equal delivery being a point of

great consequence. Wet weather ought likewise to be avoided, as the least degree of poaching is injurious."

S. D. Witt, Esq. of Albany, in a valuable paper published in the third volume of Memoirs of the New-York Board of Agriculture observes, "that in order to have good pastures or meadows, no pains or expense must be spared to enrich the soil where that is needed, to destroy as fast as possible by a suitable course of husbandry, every weed and plant that previously occupied the field, to have the ground perfectly pulverised by ploughing and harrowing, and then to sow on it a plentiful quantity of grass seeds, suited to the soil, and of those kinds which hath been proved to be the best for those purposes. The fault I mean to find with our practice contrasted with that of the English, is this, for pasture or meadow we sow in the spring of the year, on a field of winter grain, a small quantity of grass seed, from which we expect our future pastures and meadows, and trust to their branching out in two or three years so as to make tolerable pastures or meadows. In the mean while other grasses and weeds spring up so as to occupy most of the ground; and this is most notoriously the case in our new country, where the seeds of thousands of varieties of plants lie in the ground ready to spring up and overcome the growth of artificial grasses. In order to do this the English practice before described is the more necessary here. The aboriginal weeds must be first destroyed by preceding crops, especially by such as require the use of the hoe, and then such a quantity of clean well selected grass seeds must be sown as will cleverly fill the ground, and in their growth smother every other vegetable. For this purpose too much seed cannot be put in the ground at once. The practice of putting a small quantity of grass seed on ground laid down for pastures or meadows, is one of the greatest errors in the husbandry of our country. On this subject I wish that our farmers would consult a book published in London, called the *Complete Grazier*. It gives receipts for the kinds and quantities of seed per acre proper to be sown on all varieties of soils, such as *clay, loam, sand, chalk, peats, up-lands, mid-lands, lowlands*.

As a sample I will copy the recipe for an acre for low lands.

Meadow Fox-tail, - - -	2 pecks.
Meadow Fescue, - - -	2 do.
Rough stalked poa, - - -	2 do.
Ray grass, - - -	1 do.
Vernal grass, - - -	1 quart.
White clover, - - -	2 do.
Marl grass, - - -	2 do.
Rib grass, - - -	2 do.

In the receipts for the various soils the quantity of seed is generally about a bushel per acre. Let this be compared with our practice.

Here it is proper to be observed, that in laying down grounds for pasture lands, the English select the seeds of such grasses as will come to maturity in succession; but I think they carry this scheme to excess, and that there is no necessity for a mixture of such a variety of seeds to be used for these purposes. In our country the most esteemed grasses are—white and red clover, timothy or herds grass, the red top and foul meadow. With those some other indigenous grasses intermix, the merits of which deserve to be investigated. Our best grasses for meadows are unquestionably the timothy, the red top, and foul

meadow. The merits of this last mentioned grass are not generally known, and I suspect it to be the best, for low alluvial soils, to be found in our country. It appears to me to be a variety of the red top, *Agrostis vulgaris*, and preferable to it, being more delicate in its structure, and having leaves more slender, longer, and in greater abundance. I have been told by an acquaintance from Orange county, that it is chiefly used on the reclaimed drowned lands there, and preferred to all other grasses, and that it yields most abundant crops. I know from my own observation for a number of years, that without any artificial preparation it has gradually supplanted the coarse aquatic grasses on the lower parts of the lowlands at Ithaca. There can be no better hay than that which is made of it. On a rich moist soil it will grow uncommonly dense, and I should think would yield as much from an acre as any other of the best cultivated grasses.

FOR THE NEW ENGLAND FARMER.

MULBERRY HEDGES.

MR FESSENDEN—During a short tour in England, last summer, I was much pleased with the appearance of the beautiful green living partitions, which separate the fields and plantations one from another, and afford a protection and security to every enclosure against the intrusion of domestic animals and fowls, which our walls and fences can never give. Most farmers are but too well acquainted with the vexation that often attends upon a fence being broken down, and cattle, hogs and sheep admitted to a field where rest, perhaps, the hopes of the owner for the coming year. By substituting strong and well pruned live hedges, these vexations and disappointments would be in a great measure avoided; for though rains sometimes undermine your walls, and winds lay your fences prostrate, the fast-rooted hedge stands secure,—sheep may climb your walls, your oxen throw your fences, your pigs and geese creep through your barn door, fowls fly, the well set living hedge opposes to all a barrier, which none will dare attempt; and even from unruly boys your gardens and orchards will be more secure.

One improvement on the English plan of hedging seems to be important; and to suggest such improvement is the object of the present article.—It is probable that the thousandth part of the land in England is occupied by hedges which serve no other purpose than that of giving beauty and security to the enclosures. Upon this reflection I was led to inquire whether these hedges might not be made a source of profit by adopting some shrub that would yield a valuable produce; and having had some experience in growing *White Mulberry trees*, I believe that secure and permanent hedges may be made with them in a shorter time than with any of the shrubs now used for that purpose; and the trimming necessary to keep the hedge close, strong and within proper limits, would furnish an abundant supply of food for silk worms, by which means alone the United States might produce silk enough to clothe the whole world.

The above suggestion is thrown out with the hope that some practical agriculturist will make the experiment next spring by setting a hedge of young mulberry trees. They should be placed about one foot apart, and should be protected until they have acquired sufficient strength. When the hedge has attained five feet in height, the clippings—

may be commenced by cutting with shears from the top and sides, to keep it down to that height, and about eighteen inches in thickness; this being done only in the season of feeding the silk worms, the double object of pruning the hedge and procuring food for the worms, is obtained by the same process.

ARNOLD BUFFUM.

Fall River, 8th mo. 14, 1827.

Licences in New Hampshire.—By a law passed at the last session of the New Hampshire Legislature, some good provisions have been made against intemperance. "No person can now sell spirituous liquors, to be drunk on their premises, without being duly licensed by the selectmen of the several towns in which they reside, and the selectmen are authorized to license only such as in their opinion are of good moral character and who will not abuse the privileges thus granted to them." The fee for a yearly license is 20 Dollars.

The quantity of Boots and Shoes manufactured in Massachusetts is believed to amount to many millions of pairs annually for exportation, beside those for home consumption. Massachusetts may be said to supply (independent of those sent to N. York) most of the Southern and Western States, South America, the West Indies, &c. It is astonishing how little the extent of this business is known. The sale of leather is co-extensive, and the article is drawn from all quarters to this city. Why are there no wholesale shoe manufactories in Boston, as in New York City, Baltimore and Philadelphia? If Boston should get a manufacturing turn, its population would treble in a few years. [Palladium.]

A number of emigrant paupers have died at St. Andrew's, N. B. and 30 were in the poor house there at the last date. A tax on Emigrants is proposed in N. Brunswick.

Several young men have returned to Connecticut and New York who were enlisted in the Colombian service some years since at New York. They represent their treatment and that of more than 400 of their countrymen as very cruel.—They were recently discharged from the navy, starving and almost naked. The American Consul at Carthagená refused to assist them, as they say.

Peace between Brazil and Buenos Ayres. Capt. Hedge from Pernambuco, confirms the news of the conclusion and promulgation of Peace between Brazil and Buenos Ayres; that there was great rejoicing on the event, and that business as well as the people wore a new aspect.

The Commissioners and Engineer on the Western Rail Road, are actively engaged in the duties of their appointment. They have explored two routes between the Charles and Concord rivers, and we understand are still engaged on that part of the route.

The leak in the Thames Tunnel has been so far stopped that the work was to be resumed in a few days.

The accounts from the manufacturing and agricultural districts in England were very favourable.

Mr Madison has entirely recovered from his late illness.

MEAD.

This is an agreeable liquor prepared of honey and water, with the addition of spices.

Various methods are practised in the brewing of mead; which, however, do not essentially differ from each other: the following is one of the most approved:—Let the whites of six eggs be well incorporated with twelve gallons of water, to which twenty pounds of honey are to be added. The ingredients should boil for the space of one hour: when a little ginger, cloves, cinnamon, and mace, together with a small sprig of rosemary, are to be put into the liquor. As soon as it is cool, a spoonful of yeast ought to be added, and the mead poured into a vessel which should be filled up, while it works. When the fermentation ceases, the cask ought to be closed, and deposited for the space of six or eight months in a vault or cellar, of an equal temperature, and in which the liquor is not liable to be affected by the changes of the weather. At the end of that period, it may be bottled, and is then fit for use.

A more simple, and, to some palates, more agreeable method is, to mix the honey in the proportion of one pound to a quart of water, which is to be boiled, scummed, and fermented in the usual manner, without the addition of any aromatic substances. It ought to be preserved in a similar manner, and bottled at the expiration of the same period of time.

The following recipe is recommended by the same correspondent who furnished that for the currant wine.

To 30 gallons of water, add 90 pounds of pure honey, boil and skum, put the liquor into a large open tub, and add two ounces of bruised ginger-root, half an ounce of cinnamon, the same quantity of pimento; let the whole stand until of a proper temperature, then add yeast as in *current wine*, flavour and barrel it up for use.

Mead was formerly the favourite liquor of the ancient Britons, and Anglo-Saxons.—It still retains its place at country feasts in the western parts of Britain; where considerable quantities are brewed annually. Being an wholesome and pleasant beverage, it is far preferable to brandy, gin, or other pernicious spirits; though it does not always agree with the bilious, asthmatic, or those whose breast and lungs are in the least affected. But if it be kept for a number of years in proper vessels, and dry cellars, it acquires a flavour and strength equal to the best Madeira or even Tokay wines: in this state, mead is a true medicine to the aged and infirm, when used with moderation.—*Domestic Encyclopedia.*

It is said that the kings of England and France have written in person, to Ferdinand, urging him to adopt a mode of government better calculated than the present, for the wants and character of the people of Spain. Mr. Canning has urged the same project upon the Spanish foreign minister. What reception Ferdinand gave to the propositions is not stated.

A writer in the Portsmouth Journal makes some remarks on the trade of New-York and Boston. *Theory is often deceptive. Experience will decide.* Boston makes most of her importations from the first sources.

She imports direct from Europe to a considerable extent, and when circuitously, it is on her account, and, we believe, does not affect the prices.—She imports direct from Canton, the East

and West Indies, Africa, the Mediterranean, South America and the southern United States, and she has lines of packets with Baltimore, Philadelphia, Troy, Albany, &c.

It is said the Boston merchants who import European Goods through the N. Y. Packets, have a deduction of the Atlantic freight equal to the freight, &c. from N. Y. to Boston, and thus have those goods in store as cheap as the N. York merchant.—[Palladium.]

Yellow Locust Seed.—Turnip Seed, &c.

For sale at the New England Farmer office, a few lbs. Yellow Locust Seed, superior scarlet short top Radish, White Mulberry, 13 varieties of Turnip, Girkie or pickling Cucumber, &c. with a new assortment of ornamental flower seeds.

Fresh Mulberry Seed.

For sale at the Farmer office, No. 52 North Market Street, genuine White Mulberry Seed, raised in Mansfield, Con. 1827.

For sale at the New England Farmer Office, No. 52 North Market Street.

Lucerne or French Clover seed—Red or Dutch Clover—White Honyuckle Clover, and other Grasses.

Miscellanies.

Pope.—The following compliment to the genius and beauty of this immortal poet, is extracted from the notes to his Dunciad. They are supposed to have been written by Lewis, an usher in Westminster School: though their authorship is disputed:

“While malice, *Pope*, denies thy page
Its own celestial fire;
While critics, and wild bards in rage,
Admiring, won't admire:
While wayward pens thy worth assail,
And envious tongues decry;
These times, though many a friend bewail,
These times bewail not I.
But when the world's loud praise is thine,
And spleen no more shall blame;
When with thy Homer thou shalt shine
In one unclouded fame!
When none shall rail, and every lay
Devote a wreath to thee;
That day (for come it will) that day
Shall I lament to see.”

Mr. Burke.—When the trial of Mr. Hastings commenced in Westminster Hall, the two first days were wholly taken up in reading the articles of impeachment against him; and four more were occupied by Burke in opening that celebrated case, and stating the grounds of accusation. Never were the powers of that great man displayed to such advantage as on this occasion. The contrast which he drew between the ancient and modern state of Hindostan, was sketched with the hand of a master, and wrought up in a manner that could not fail to fix the attention, and to command the admiration; when at length, he came to speak of Mr. Hastings, no terms can describe the more than mortal vehemence with which he handled his manifold accusations against him. He seemed for the moment as if armed to destroy, with all the lightnings of the passions. The whole annals of judicial nations contain nothing finer than his conclusion.

“I impeach Warren Hastings,” said he, “in the name of the Commons of Great Britain in Parliament assembled, whose Parliamentary trust he has abused.

“I impeach him in the name of the Commons of Great Britain, whose national character he has dishonoured.

“I impeach him in the name of the people of India, whose laws, rights, and liberties he has subverted; whose properties he has destroyed; whose countries he has laid waste and desolate.

“I impeach him in the name of human nature itself; which he has so cruelly outraged, and oppressed. And I impeach him in the name, and by virtue of these eternal laws of justice, which ought equally to pervade in both sexes, every age, condition, rank, and situation in the world.”

The agitation produced by this speech was such, the whole audience appeared to have one convulsive emotion: and when it was over, it was some time before Mr. Fox could obtain a hearing.

Amidst the assemblage of concurring praises which this speech excited, none was more remarkable than the tribute of Mr. Hastings himself. “For half an hour,” said that gentleman,

“I looked up to the orator in a reverie of wonder; and during that space I felt myself the most culpable man on earth.” Had the sentiment concluded here, our readers would not believe it was in the manner or language of Mr. Hastings. “But,” continued he, “I recurred to my own bosom, and there found a consciousness which consoled me under all I heard and all I suffered.”

Punning.—A young lady reprimanded her shoemaker for not following her directions respecting a pair of shoes which she had ordered; and among other charges, insisted that they were not *felloes*. Honest Crispin acquiesced in the propriety of this remark, and stated that he purposely made them so in order to oblige her, well knowing the purity and chastity of her disposition, and that she was not fond of *felloes*.

Complaisance.—The great Henry the Fourth, of France, being asked by one of his haughty favourites, why his majesty gave himself the trouble to return the salute of so many beggars, who made their obeisances to him in the streets, replied, “Because I would not have my beggars in the streets exceed me in complaisance.”

Bustle in Business.—The Duke of Newcastle was a person of great bustle and appearance of business—always in a hurry, and indiscreet, tho' quick in conversation. It was this manner that induced the Dowager, Lady Townsend, to say of him that “he always put her in mind of a man that lost two hours in the morning, and was looking for them the rest of the day.”

On Thursday night last, a *Night blooming Cereus*, belonging to Mr. Jacob Beck, of this borough, expanded its beautiful flower, and was visited by crowds. That was, we believe, the third time it has bloomed. It may be remarked as one of the “singular coincidences” which have of late become so common, that a plant of the same species belonging to the Rev. Mr. Duffield, of Carlisle, bloomed in the same night.—*York Paper.*

A wag passing a livery stable one day, in front of which several horses were tied, stopped suddenly and gazed at them for some time with a pliz indicating the utmost astonishment, and then addressed the owner, who was standing near, and asked him “if he made horses”—“make horses?” said the knight of the broom and currycomb, “no! why do you ask such a question?” “Only,” replied he, “because I observed you have several *frames* set up!”

Common place events.—The last *Darien Gazette* announces the return of its editor. In the course of eight or ten days he had sustained two attacks of fever, one attack of gravel, one attack of violent abuse, and one robbery. More trifles for an editor.

A lad on delivering his milk a few mornings ago, at Portsmouth, was asked why the milk was so warm. “I don't know,” he replied, with much simplicity, “unless they put in *warm* water instead of *cold*!”

Cathedral in Montreal.—The Roman Catholics are now building, at Montreal, a cathedral 360 by 200 feet, capable of holding 10,000, and having four pulpits. It is intended to be the most magnificent of any in America.

A Gold Mine has been discovered in Union district, South Carolina, in the waters of Tiger River. The ore is said to be of such extent, as to afford employment to 500 hands at good wages. A specimen of the gold has been pronounced by Dr Cooper, equal in purity to any he ever saw. A company is expected to be formed to work the dust. It is asserted that the members of the Company formed to work the mines of North Carolina, have divided each \$3000.—*Charleston Patriot.*

Chinese Anecdote.—A man who was accustomed to deal in marvels, told a country cousin of his that he had three great curiosities in his possession: an ox that could travel 300 miles a day; a cock that told the hour of the night, and a dog that could read in a superior manner. Says the cousin, “these are extraordinary things indeed! I must call upon you, and beg a sight of them.” The liar returns home and tells his wife what has happened, saying he had got into a scrape, and did not know how to extricate himself. “Oh never mind, says she, I can manage it.” The next day the countryman called, and inquiring after his cousin, is told that he is gone off to Peking.—And what time is he expected back? “In seven or eight days.” “How can he return so soon?” “He's gone off upon our ox.” “Apropos of that,” continues the guest, “I am told that you have a cock that marks the hour.” A cock happened just then to crow. “Yes, that's he; he only tells the hour of night but reports when a stranger comes.” “Then, your dog, that reads books! might I beg to borrow a sight of him.” “Why, to speak the truth, as our circumstances are but narrow, we have sent the dog out to keep a school!”

An infallible remedy for the Tooth-Ache.—A lady of this town has favoured us with the following receipt, which, she says, has never failed to produce the desired effects although tried in innumerable instances. Make a solution of Camphor and Cayenne Pepper; dip therein a small quantity of raw cotton and apply it to the affected tooth, and it will give instant relief. To prevent the composition's getting to the throat, lay a bit of rag over the tooth for a few moments.

[Wilmington Herald.]

Saxony Sheep.

On Friday the 24th August next, at 3 o'clock P. M. at Brighton near Boston, will be sold by public auction, a choice stock of about 100 Saxony Rams, just imported in the brig Comet, Capt. Meef, from Hamburg.

These sheep were selected from the purest blood in the kingdom, and will be found at least, equal in point of fineness of fleece and symmetry of form to any heretofore imported. The sale will be perfectly free and unlimited.

Samples of the wool from different parts of each animal may be seen at No. 46 Central street, or at the office of the auctioneers, at any time previous to the sale.

COOLIDGE, FOGOR & HEAD.

On Thursday, the 23d of August, at the lower division of the hall over the new Market House, under the direction of the *New-England Society*, will be sold, a large assortment of American fleece WOOL. Wool-growers and others, who wish to benefit by this favourable opportunity for disposing of their Wool, are informed, that we are prepared to receive it, any time previous to the 17th of August, at which time the catalogue will be closed. COOLIDGE, FOGOR & HEAD, Auctioneers Boston, July 27, 1857.

THE FARMER is published every Friday, at \$3.00 per annum, or \$2.50 if paid in advance. Gentlemen who procure responsible subscribers are entitled to a 25% volume gratis.

No. 5.

AGRICULTURE.

[BY THE EDITOR.]

WORMS IN THE HEAD OF SHEEP.

A sort of fly which naturalists call *Oestrus Ovis*, about this time in the year, attacks sheep, and deposits its eggs in the nostrils of those animals producing worms, which frequently destroy them. A friend has assured us that the following is an infallible preventive of any bad effects from that insect. Smear the nostrils of the sheep with tar; apply it before the fly makes its appearance, and continue the application till its departure. The tar should be applied two or three times a week, or often enough to keep the nose continually blackened with that substance. Perhaps if the tar were placed under cover, so that the sheep could have access to it, and mixed with a little fine salt, the sheep would make the requisite application. The tar will prove useful not only as an antidote against the troublesome and dangerous insect above referred to, but is an excellent remedy against cough, rot, and consumption of the lungs. It promotes and confirms the health of the animal, and would be useful to sheep, in a high degree if the *Oestrus Ovis* were not in existence.

EARLY ONIONS.

Mr. James Smith, an English Gardener, in the Transactions of the London Horticultural Society, gives the following "directions for forcing onions to produce bulbs in clusters at an early season." He sows the seed in April, thickly in a bed, and does not afterwards thin the plants which come up; this causes them to remain small: a part of them are used for pickling, and the remainder being about the size of walnuts are planted in January or February [as soon as the frost will permit in this country] pressing each onion into the earth so deep as to just cover it. As soon as the seed stalks appear he breaks them off, and instead of making any effort to form new ones, the onions begin to form young bulbs round the old ones. By this process onions may be obtained two or three inches in circumference, fit for the kitchen early in Spring, at a time when spring sown onions are not larger than quills.—Onions thus thrown into clusters will be full grown by the end of June, and fit to take up then, but they do not keep well.*

A process similar to the above is familiar to American gardeners; and is thus alluded to in Deane's New England Farmer. "If onions fail to have good bottoms the first year, and chance to escape rotting till spring: they may perhaps get them by being transplanted. Even an onion that is partly rotten will produce two, three, or four good ones, if the seed stems be taken off as soon as they appear. They ripen earlier than young ones, have the name of rare-ripes, and will sell at a higher price.

GOURDS AND POMPIONS.

A writer for London's Magazine says that a Mr Grey plants Gourds and Pompions in the paths between asparagus beds, and lets the vines run

over them; and he considers that the large leaves do good to the asparagus roots by protecting them from the sun, while the tall stems of the asparagus afford a shelter to the leaves of the gourds. Last summer's (1824) drought, had burned up, on his gravelly soil, the cabbages, peas, turnips &c. by the beginning of August, and had he not been provided with gourds as a substitute, the family must have had recourse to market. The servants disliked them at first, but soon came to like them better than summer cabbage. He therefore recommends, especially where the soil is liable to be burnt up in summer, planting the vegetable marrow and other Cucurbitaceæ [plants of the melon and gourd species] as a reserve crop.

Mr London adds in a note that "the tender tops of all the edible species of cucurbitaceæ, boiled as greens or spinach, are a more delicate vegetable than the fruit. It must be worth something to gardeners and cooks to know that either or both may be used for this purpose, when scarcely anything else can be got."

The following Receipt was communicated to JOHN PRINCE, Esq. by FRANCIS WINKLEY, a member of the Religious Society denominated Shakers, of Canterbury, N. Hampshire. It was published in the 2d vol. of the N. E. Farmer, but is now repeated for the benefit of recent subscribers.

AN EASY METHOD TO MAKE GOOD SOAP.

The vats or vessels containing it are to be situated in the rays of the sun; and at the same time sheltered from the rain.

To one barrel of good lye sufficiently strong to bear up an egg about six gallons of clean melted grease, and thus in proportion for any other quantity.* Stir the mixture well together, and repeat the operation twice daily, till it becomes so thick and stiff as to render stirring impracticable. Let it stand in this situation through the summer; or till needed for use, adding a little weak lye occasionally as the soap dries away.

With due respect, your friend,

FRANCIS WINKLEY.

* O. add as much grease as the lye will absorb, or eat up.

FOOT ROT IN SHEEP.

A friend informs us that this disease is very prevalent among flocks of sheep in many parts of the country. In the New England Farmer vol. v. page 233 we gave some remarks on this disease, translated from a letter received by Mr Thomas Starle, of Boston from a correspondent at Leipzig. The following is an extract: "Cut away with a sharp Surgeon's knife not only superfluous hoof, but also all the diseased flesh under it.—This may be distinguished from the healthy flesh by its greyish colour. Being well satisfied that nothing unsound remains in the foot, I then apply with a brush to the fresh wound some caustic liquor and immediately place the patient in a separate clean stable.

"It is surprising to see animals thus treated who were yesterday hobbling about on their

knees, spring up to day and run about with the flock.

"It is necessary, however, to examine the convalescent daily, and repeat the liquid application, and if any excessive heat is discovered in a foot it proves that the first operation has not succeeded and a second cutting must take place without delay.

"The caustic remedies which I have found most effectual, are diluted oil of vitrol and aqua cerulea. The latter in the state in which it is found at the apothecaries without any addition. The oil of vitriol I mix with three times its quantity of water or for cases of not long standing with some thing more.

Mr R. H. Parkinson's receipt for the cure of Foot Rot.

A speedy and easy remedy for both prevention and cure. To prevent it, take lime from the kiln, spread it on the floor of a barn two or three inches thick, or in some convenient house, large enough to hold the flock likely to be affected, first cleansing the feet by paring the superfluous hoof, and with a sponge or old rag dipped in chamber lye, wash the foot clean, then let the sheep stand on the lime six or seven hours, if twice the better. The cure, the same as above, but the parts affected, after paring and being washed with chamber lye, should have lime applied to the quick or wounded parts, rubbing it on, and leaving as much on the hollow or fore part as it will contain then let the sheep stand on the lime as directed above.

FATTENING SWINE, &c.

We are informed by Judge Peters of Pennsylvania, formerly President of the Philadelphia Agricultural Society, in a communication which appeared in the Philadelphia American Daily Advertiser, that "sour food is the most grateful and alimentary to swine. One gallon of sour wash goes farther than two of sweet. I mean the wash acidulated to the degree required for distillation, not acetous.

"Dry rotten wood" [kept constantly in styes for fattening hogs to eat at pleasure] is a good thing; but I will take the liberty to mention what I think a better, we have the ee blacksmiths in this town; and my hogs eat up all the ashes or cinders they make; we haul it into the pens by cart loads, and the hogs will devour this at times with more avidity than their ordinary food.

Charcoal it has been said will answer a similar if not more valuable purpose than either cinders or rotten wood." If swine are supplied with a small quantity of coals, (according to a statement by an Ohio farmer,) say two pieces a day to each, about the size of an hen's egg, they will discontinue rooting, remain more quiet and fatten faster than they will otherwise. Charcoal will operate on the human frame as a cathartic, and, probably may have the same effect on the animal we are treating of. If so it may supersede the necessity of using brims'one, antimony and other drugs with which hogs are often dosed. At any rate it will cost but little to give them a constant access to coals, which may be sifted or raked from your fire place, and they will be induced by instinct to cop-

some such quantities as will promote their health and expedite their fattening.

When you first commence fattening your swine care should be used not to give them more than they will eat with an appetite. If they become gorged or cloyed their thriving is retarded, and there is danger from staggers, and other diseases consequent upon repletion or the high living, to which these four footed epicures are addicted.

The practice in Scotland is to rear swine chiefly on raw potatoes, and to fatten them on these roots boiled or prepared by steam, with a mixture of oats, barley or bean and pease meal. Their troughs should be often replenished with a small quantity of food at a time and kept always clean and seasoned occasionally with salt. Mr Marshall, an eminent English agriculturist says "young pigs require warm meat [food] to make them grow. Corn (grain) and cold water will make them healthy; but warm beverage is considered as requisite to a quick growth." The same writer mentions another mode of managing swine, which may be worth attention. Some English farmers, he says, "keep two or three little store pigs in the fattening sty. While the fattening hogs are taking their repast, the little ones wait behind them; and as soon as their betters are served, lick out the troughs.

"Besides the advantage of having by this expedient no waste, nor foul troughs, there is another. The large pigs rise alertly to their food, lest the small ones should forestall them; and fill themselves the fuller, knowing that they have it not again to go to.

"The disadvantage of this practice is, I understand, the large ones are apt to lord it too much over the little ones; especially in a confined sty. If however they had a separate apartment assigned them with an entrance too small or the fattening swine to follow them, this disadvantage would be in a great measure remedied.

An English farmer fattened 8 pigs in the following manner, which may be recommended in cases where a constant and regular attention cannot be given to feeding the animals. He placed two troughs in the sty: one he filled with raw potatoes, the other with peas, and gave no water.—When the pigs were thirsty they ate the potatoes. In this way, it is probable, that the animals could not only do without water, but likewise needed no brimstone, antimony, nor other medical substances, for raw potatoes are cooling and drastic; and might serve at once for food and physic. Instead of peas probably dry Indian corn, or what would be still better dry Indian meal might be substituted.

Rubbing and currying the hides of fattening hogs is not only grateful to them, but conducive to their health and thriftiness. In every sty a strong post should be placed for them to rub against.—They should have plenty of litter, which will be the means not only of contributing to their comfort, but increasing the most valuable manure.

The Complete Farmer says "when hogs are fattened *entirely* on acorns, chestnuts, and other productions of the forest, the flesh will eat much better and sweeter than if fattened in a sty. Some indeed say their fat will not be so solid nor so profitable, and therefore they commonly shut them up a week or ten days and feed them with dry peas; but this is a mistake; experience having shown that hogs, fattened with acorns only, have their fat as solid as those fattened with peas."

The acorns here recommended are probably those of the English oak. In the United States, the acorns of the white oak, and of the shrub oak would, perhaps, prove most valuable as food for swine. It might be well to try them, not only raw but steamed or boiled, and likewise ground into meal, and given with as well as without other mixtures.

Soaking corn for swine is no doubt a useful practice; grinding it still better. If a wash or mixture for swine be permitted to ferment till it becomes sweet with a little acid it will be the better; but it should not be suffered to become quite sour. Malting corn or suffering it to sprout increases its sweetness, and of course its nutritive power.

ON THE TRANSPORTATION OF FISH FROM SALT TO FRESH WATER.

An interesting article on this subject, by J. McCulloch, M. D. F. R. S. &c. was published in the *Journal of the Royal Institution*, London, and republished in "*The Boston Journal of Philosophy and the Arts*, vol. iii. page 31. The following abridged view of the contents of this important paper, will, we believe give most of the material facts relating to its objects.

The writer alludes to a former communication on the transportation of fish from salt to fresh water, and says a "Mr. Arnold, who has carried on these experiments, at my wish, with great zeal, has succeeded in adding many more to the list; and, both in respect to the physical fact, and to the question of economy, the success has been far greater than any one was willing to believe.

"It is certain that the flavour of every fish which has yet been tried has been improved, and I can vouch for the superiority of the bass, the mullet, the loach, the alewife and the sole, from the pond, to those from the sea. This might be expected, for it is what happens notably with respect to oysters.

"The sole becomes twice as thick as a fish of the same size from the sea, and its skin also becomes extremely dark or nearly black.

"The plaice also increases materially in thickness, and loses its spots. In some cases, it appeared three times as thick as in the sea. The bass also turns much thicker and improves in delicacy.

"The mullet almost ceases to grow in length, but enlarges in breadth, and presents a much deeper layer of fat.

"Crabs and prawns have found their own way into the pond, as have leaches, and some other small fish; and while formerly, there were one of the former two, the water is now absolutely swarming with them. Thus also, apparently, hee ls have multiplied; as it is now easy to take a cart load at once, where formerly a dozen or two was a large capture.

"Oxygen is much more easily disengaged from fresh than from salt water. Consequently, the act of respiration ought to be easier in the former than in the latter; and therefore it is not to be presumed, as it has been, that sea-fish cannot respire in fresh water.

The writer adds the "Prospectus of a plan for preserving and rearing fish for the London market," from which the following are extracts:

"From various observations and experiments, of which evidence is subjoined, it has been found that sea-fish will live and thrive, and also breed

in ponds and enclosures; and with regard to many, it also appears that it is indifferent whether the water is salt or fresh, or brackish, or alternately fresh and salt.

"It is also found that they may be fed in such enclosures, if necessary, as our domestic animals are; but that if sufficient numbers and kinds are placed together, they feed each other without requiring further care.

"It is further observed that every, or almost every species, improve in flavour and quality, as oysters are known to do, under transportation.

"It is well known that, of all the fish brought to market, a very small proportion is in good condition, the rest being apparently ill fed; and hence the number of bad fish so well known to fish-mongers.

"It is much better known that, from bad weather, or other causes, the supply of the market is very irregular. Thus the public suffer when the supply is short, and the merchant when there is a glut.

"The proposed plan, if executed, would bring the fish within our own power to be taken alive when wanted, and from being better fed, in greater perfection, and more uniformly good. It would be like taking stalled oxen instead of wild Scotch cattle.

"The plan is, to enclose, in any convenient part of the Thames (since the quality of the water is proved to be indifferent,) a space sufficient for the purpose. A dock, or an excavation in the nature of one would be unnecessary, as the water itself, in many places not navigable might be enclosed by a palisade. In this the fish would be received from the fishermen, by means of well-boats alive. Those which chanced to die would become the food of others. Many would breed, as they have been found to do, and thus also produce food. But they might also be fed by means of butcher's offal, or other matters easily procured in a great city, as was the practice with the ancient Romans. From the enclosure, the fish would be taken by nets, the kinds in demand and the quantity selected, and the bad returned for improvement.

"With respect to fresh waters, we have evidence of the power of keeping and improving fish, in them from the practice of the ancient Romans. From the testimony of Columella, and the other writers, "*de Re Rustica*," (on Rural Economy) it was the practice of the Roman farmers, in the earliest days of the Republic, to go down to the sea and bring up the spawn of sea fish to the fresh waters of Rome, where they multiplied and improved. It was a branch of farming. It became the amusement and luxury of the rich and great in the times of Imperial Rome.

"Lastly, this plan has been recently put to the test under the direction of the writer of this note in Guernsey, by Mr. Arnold. In a pond of about four acres only, many sea fish are now thriving, and all those which have had sufficient time have propagated; all have improved in quality and many very remarkably. This pond was at first worthless, containing only a few eels; at present it produces a large rent, and can supply the market when the weather prevents the boats from going out. It is remarkable also, that since the introduction of the sea fish, the eels have multiplied a thousand fold, so as themselves to form a considerable revenue. This proves that fish may be fed merely by bringing different kinds together, as is the case in nature.

A scientific friend of ours, who has recently returned from a journey from Boston to the interior parts of New-Hampshire, informs us that the *Cusk*, a sea water fish, has been introduced into Winnepissogee Lake; and is now quite frequently caught by angling.—*EDW. N. E. FARMER.*

RIPENING GRAPES.

It is stated in the Transactions of the London Horticultural Society, that Mr. Thomas Fleetwood, of Dunnington near Alcenter, hastens the maturity of grapes on open walls by the following method. Before the vines are out of flower, he brings each branch into a perpendicular position by a thread attached to its extremity, and fastened to a nail in the wall, carefully confining the young branch with the bunch thereon as close to the wall as possible. Fixed in this way, they ripen a month earlier than when left to hang in the usual way.

THE COW TREE.

This tree, which has been named *Galactodendron*, and appears to belong to the family of Sapotaceæ, grows on rocky declivities on the northern Andes. Its leaves are large, oblong, thin, dry, and coriaceous. "Its thick ligneous roots scarcely enter the rock; for several months in the year rain scarcely waters its fan-shaped leaves. The branches appear dry and dead. But when an incision is made in the trunk, a sweet and nutritious milk runs from it. It is at sun-rise that the vegetable liquid runs most abundantly. Then the natives and negroes are seen to come from all parts provided with vessels to receive the milk, which becomes yellow, and thickens at the surface. This vegetable milk possesses all the physical properties of the milk of animals, only it is a little thicker, and mixes easily with water. When boiled it does not coagulate, but a thick yellow pellicle is formed on the surface. Acids do not form with this milk any conglum as with that of the cow."—*Humboldt, Voyage aux Régions Equinoxiales du Nouveau Continent*, lib. v. chap. 16. p. 263 and 261.

THE GRASSES. By Mr George Sinclair.

It has been justly observed by James Edward Smith, in his English Flora, that the grasses afford more sustenance to man and to the larger animals than all the rest of the vegetable kingdom put together, their herbage so perpetually springing, and so tenacious of life, accommodated in one instance or other to almost every climate, soil and situation, affords to nature her most welcome clothing, and to the cultivator of the soil his chief riches. Nothing poisonous or injurious is found among them. They constitute one of the most perfect natural orders of plants, and although humble, and until lately, overlooked by the general observer, consist of upwards of a thousand perfectly distinct species, distinguished from each other by their specific botanical characters, by the difference which exists in the proportions of the constituents of the nutritive matter afforded by each, by the different periods at which they produce attain to perfection, and by the peculiar soils and situations to which the different species are adapted.

The farinaceous seeds of the annual grasses supply man with the staff of life, and the herbage of the perennial species afford to the more valuable domestic animals that constant supply of es-

sential food without which they could not exist in any considerable number for any length of time, much less be brought to furnish us with the most important articles of clothing, and some of the most important parts of food; meat, milk, butter, and cheese. Wool and leather, with all the concomitant advantages, such as labour, manure &c. which result to the cultivator of the soil from the use of cattle would be lost without the cultivation of the perennial grasses.

The nutritive powers of the different species of grasses are found to be in direct proportion to the quantity of saccharine, mucilaginous, albuminous, bitter, extractive and saline matters which each affords.

There are but few species which attain their height of produce at the same period of the season, consequently scarcely a month occurs which is not the season of some particular species attaining its perfection of growth; and here it may be observed, that a grass garden, where a number of grasses are arranged side by side, illustrate this important part in the economy of grasses in a clear and interesting manner. It is from this property of the natural grasses, connected with a combination of a considerable number of different species, which are always found in the most rich and fattening pastures, that the great superiority of these over artificial pastures of such as are formed of one or two species only, chiefly arises; and hence it is that the former, whether formed by nature in the course of many years, or by art in one (by sowing the seed of all the essential species, or by stocking the soil at once with a sufficiency of these plants, precluding thereby the introduction of species of grasses or weeds) are productive of a perpetual verdure and supply of fresh herbage unknown in artificial pastures, consisting of one or two species of plants only.

REMARKS ON NEAT CATTLE.

BY MR MARSHALL.

1. The head small and clean, to lessen the quantity of offal. 2. The neck thin and clean, to lighten the fore-end, as well as to lessen the collar; and make it fit close and easy to the animal in work. 3. The carcass large, the chest deep, and the bosom broad, with the ribs standing out full from the spine; to give strength of frame and constitution, and to allow sufficient room for the intestines within the ribs. 4. The shoulders should be light of bone, and round off at the lower point, that the collar may be easy, but broad, to give strength; and well covered with flesh, for the greater ease of draught, as well as to furnish a desired point in fattening cattle. 5. The back ought to be wide and level throughout; the quarters long; the thighs thin, and standing narrow at the round bone; the udder large when full, but thin and loose when empty, to hold the greater quantity of milk; with large dug-veins to fill it, and long elastic teats for drawing it off with greater ease. 6. The legs (below the knee and hock) straight, and of a middle length; their bones, in general, light and clean from fleshiness, but with joints and sinews of a moderate size, for the purposes of strength and activity. 7. The flesh ought to be mellow in the state of fleshiness, and firm in the state of fatness. 8. The hide mellow, and of a middle thickness, though, in our author's opinion, this is a point not yet well determined. Cattle, as well as horses, have been observed to

thrive better in salt-marshes than in fresh-water meadows, or upland pastures; and it has been conjectured, that the herbs produced by the land near the sea, are more healthy for herbaceous animals, than such as grow on higher lands. But it is said, that the saline particles with which the earth, as well as its produce near the sea, is strongly impregnated, occasions this beneficial change in the condition of cattle: as these salts purge away the foul humours which the beasts have contracted, either by idleness, or by being over-heated in labour. As cattle are naturally fond of salt, and if left at their liberty, will take no more of it than what is conducive to their health, it is recommended to lay common sea-salt in the fields, for them to lick as often as they please.

BIGNONIA CATALPA.

This is a native deciduous tree of the United States, covered with a smooth brown bark; the flowers are produced in large branching panicles, towards the ends of the branches; they are of dark white, with a few purple spots, and faint stripes of yellow on their inside. The flowers are succeeded by long taper pods, containing seeds. The branches dye wool a kind of cinnamon color. *THUNBERG* mentions that the Japanese lay the leaves on parts of the body affected with pains; and that a decoction of the pods is esteemed serviceable in the asthma. Poultry are very fond of the seeds, and thrive on them. The timber of the catalpa tree, makes very durable fence posts.

SALES OF MANUFACTURES.

The third semi-annual Sales of Manufactures of the United States, under the patronage of the New-England Society, commenced Tuesday last in the spacious Halls over the City Market. The Exhibitions were very numerous and splendid, and purchasers apparently filled up all the places not occupied by lots of goods. Of the company were many Gentlemen from New-York and other places. The sales of yesterday were principally of Cabinet Furniture, looking glasses, elegant time pieces, hats and other articles. The sales of cotton, woollen and other dry goods took place on Wednesday last. The samples, although not so heavy as on former occasions, are, we are told, of finer fabrick, and greater variety.—*Centinel.*

RAIL ROAD.

The Commissioners of the proposed Western Rail Road have progressed as far as Westboro', [30 miles] with the survey, and find only a rise of 27 feet to a mile, which is little impediment to the facility of travel on a Rail way—besides which the descent is regular from W. to Boston, and the downward transportation may be two to one of the upward. The citizens on the route assist the Commissioners all in their power, and have the most liberal views, and the Commissioners devote every moment to the discharge of their duties.

One of the Committees on the proposed Hoo sack Canal has reported that four towns on the river transport 3008 tons annually.—*Palladium.*

History of Louisiana.—The New Orleans Mercantile Advertiser contains a favourable notice of Martin's History of Louisiana, the first volume of which is lately published. This volume brings the history of that territory down to the period when it was taken possession of by Spain, in 1763.

LUCERNE.

(Continued from page 32.)

Of the preparation of the land for Lucerne.

At whatever season you sow, the land ought to be rendered very fine by ploughing and harrowing, because all seeds buried under clods will never sprout. If you harrow after each ploughing, the labour will be less. It is not possible to prescribe the number of ploughings, because much depends on the nature of the soil. The nature of the Lucerne root points out the necessity of deep ploughing. The duration and the goodness of a field of Lucerne depend in a great measure, upon the success of the first year; if the seeds do not come up well, if they are sown too thin, weeds will obtain the lead over the grass. If you sow Lucerne in the Spring, two fall ploughings will much facilitate your deep ploughing in the Spring; besides, the earth is admirably divided by the winter frosts. *Winter* is an excellent labourer. After the last ploughing, if the furrows are deep, you must harrow before sowing. Then sow, and harrow; first with the teeth of the harrow down, then with the flat side of the harrow, and so alternately till the seeds are well covered, and it would be well to attach a bush harrow to the harrow with teeth. [In general, these directions do not differ from our usual course in sowing clover and other grass seeds, and the same treatment which is adapted to clover will be proper for Lucerne, except that the ploughing should be as deep as possible.]—EDWARDS.

Of the care required for Lucerne fields.

When the soil is adapted to the plant, and it has come up well, it requires no care. This remark does not agree with the assertions of authors, who prescribe weeding as necessary to success; a precaution useless, an expense superfluous, if the Lucerne has not been sown too thin. I had scarcely, says the Abbe Rozier, chosen Languedoc as the place of my retreat, than I began to sow Lucerne, and full of the ideas I had before acquired, I caused my fields of Lucerne to be regularly weeded. The peasants smiled at my care and solicitude. I asked them the reason of their ridicule,—the Lucerne, said they, will do more for itself, than you can do for it: let it alone, it will kill the weeds without your help. For this time they were right; the part of the field which was not weeded, was the next year as good as that which had been. After that, I was not so ready to throw away my money for nothing. The Abbe occupies some pages with the destructive effects of an insect, a Scarabæus, something like our rose bug, upon fields of Lucerne, but as we may never be visited with that scourge, we shall omit his remarks on this subject for the present.

Of the different crops of Lucerne {in the same season.}

If you give credit to the assertion of an English writer, Mr. Hall, in other respects a writer of great merit, the southern parts of France have the advantage of making even seven crops a year. Unhappily for them it is not true, be the seasons ever so favorable, even when you have water at command and can water your fields at pleasure. If you cut the plant before it is in full flower, you obtain only a watery plant of little substance, and which loses three fourths of its weight in drying. It would, besides, afford but little nourishment.

Supposing that the crop should be cut from the beginning to the middle of April, is it possible that the Lucerne should have time to flower seven times in the same season? It is rare, that we can have more than five crops. The ordinary number in the provinces, of which Mr. Hall speaks, is four crops. If the season shall have been favourable it is a fine and rich product. No field yields numerically so much as a good Lucerne field. It is a clear and net revenue for ten years, which demands no culture, no advance except that of preparing the land for the crop at first; the cost of seed, and the wages of the mowers. One third of an acre, or 400 square toises of Lucerne field, are usually let for one hundred and fifty livres, or thirty dollars a year! Happy the proprietor, who has much land fitted for Lucerne.

Many persons affirm that Lucerne will succeed in any soil; if this assertion was as true, as it certainly is false, a great part of Provence and Languedoc would be covered with Lucerne, because natural meadows are very scarce in these provinces for want of water, but experience has proved, most decisively, that Lucerne requires a deep soil, not clayey, neither too stiff nor too sandy.

In the central provinces of France, Lucerne is cut three times in ordinary years, and four times in favorable ones; and from two or three times in the northern provinces. It is a general rule that Lucerne should not be cut except when in flower; before that state, it is generally too watery, and its juices crude; after that period, it becomes too dry and too woody. Cattle should not be suffered to feed on Lucerne fields after the last cutting, nor during winter, when the ground is soft. The heads of the plants yield to the hoofs of the cattle, and injure the grass essentially. It is useful to pass a harrow over a field of Lucerne in the spring, and the crop will amply repay the expense of it. Lucerne should be cut in a cool dry time, and tended as rapidly as possible. Rains,—frequent rains while making are very injurious to this grass. Let it be cut under circumstances ever so favorable, and be perfectly dry, it must not be carried in with the dew upon it, nor moved in the very heat of the day, because, in that case it is very apt to lose its leaves, which are the best part. For this reason it should be stirred as little as possible in the middle of the day. Great care should be taken that the hay should be well cured, otherwise it is apt to heat, and even take fire. The first cutting of Lucerne in any season is the least valuable, because it is apt to be mixed with other grasses or plants. The second is the best; the third is usually very good also, but in the fourth and later crops, the juices of the plant are not so rich, and of course are less nutritive.

Of the means of renewing the vigor and growth of Lucerne Fields.

Lucerne fields will wear out in time, but you may retard its period of decline by different treatment and manures. The first, which is the most prompt, convenient and cheap, is to feed your sheep upon it after the last cutting, and even during winter.

Mr. Meyer proposed in 1768, to employ Gypsum or plaster of Paris to revive and recruit old Lucerne fields, and communicated to the economical society of Berne, the several experiments he had made. These experiments were repeated by Mr. Kirchburger with care, and the following were the results.

1. That a quantity of calcined plaster, equal in measure, to the quantity of oats which would be required to sow any piece of land, is sufficient to manure it.

2. That gypsum succeeds better on Lucerne fields which are rich, than on those which are poor and sandy.

3. That it produces a greater effect the first than the second year.

4. That it is less active in a moist soil than in a dry one.

5. If you sow the plaster as soon as it is possible in Spring, the first crop will feel the effects of it.

Mr. the Abbe Rozier adds "I acknowledge according to my own experience, that plaster is very beneficial for Lucerne fields which begin to decline; that it facilitates in a great degree the growth of the large clover; that it is very useful in meadows covered with moss."

The Abbe proceeds to recommend air-slacked lime, which he prefers to plaster. He notices, and approves a suggestion of the celebrated Duhamel, that when a Lucerne field becomes partially disurnished by the death of some plants, to supply their place by laying the branches of the adjoining ones, which will take root; but it seems to us that a simpler course, which we have long since adopted with clover is preferable, which is, every spring to run over the field with a harrow, and throw in fresh seeds in the bare spots.

Of the value of Lucerne as Food.

Lucerne loses some of its value in proportion to its distance from its native soil; that is to say, it is not so nourishing, because its juices are more watery when grown in northern countries. Notwithstanding this no fodder can be compared to it in point of quality; none keeps animals in so high a state of flesh; none augments or increases the quantity of milk so much as Lucerne. These praises in all respects merited, require however some qualifications. Lucerne is heating to animals, and if you do not moderate the quantity in the hot season of the year, and especially in Southern provinces, horned cattle will become diseased. If you trust your labourers, they are so proud of seeing their cattle fat, that they stuff them with this food, and are unwilling to believe that it can be the cause of disease. I know but one mode of preventing the waste of Lucerne by your servants and labourers, and that is to mix it in equal parts with straw, not in layers, but confusedly and generally mixed. The straw contracts the smell and flavour of the Lucerne; the animals eat it with pleasure, and are never injured by it. Lucerne given green to horned cattle or horses, is apt to purge them; for which reason it is a rule never to give it till it has been cut 24 hours. Care also is taken to give it in small quantities at a time, lest they should be hoven. This is not peculiar to Lucerne. The same effects are produced by green wheat, oats, &c. All pasturage which is too succulent is dangerous. In case this accident of being hoven should occur, an expedient which I have tried has never failed, (says the Abbe Rozier) which is to make them swallow an ounce of nitre (salt petre) in a glass of brandy, to empty the bowels of the animal, and to make him run.

(To be concluded next week.)

Everything respecting the Thames Tunnel is proceeding favourably.

WOOL.

The following is from a person long resident in Sussex, (Eng.):—So great an effect has the most trifling change of soil or herbage on the growth of wool, that, on two farms adjoining each other on the South Downs of Sussex, there is annually a difference in the value of their respective growths of from 3s. to 4s. per tod, even though the ewes from which it was shorn should have been originally equally good as to breed and staple. The experiment has, he intimates, been tried for several succeeding years, by the occupants of the farms alluded to having exchanged, each year, fifty ewes of the same age and quality, and the effect ascertained by the wool of one of the parcels of ewes invariably degenerating. Nor is this, he signifies, the only instance of the kind he has witnessed. Thin chalky land, covered with a fine-textured turf, interspersed with wild thyme, small wild clover and eyebright, is that, he submits, which produces the finest wool. It is, indeed, a well known fact, that wool always becomes coarse, though increased in weight, from sheep being fed on strong land. Hence it is that a Southdown ewe produces a fleece full a third heavier, though much coarser, the year she is fattened, than any one that preceded it.

THE PLOUGH.

This instrument has held the first place among the implements of agriculture in all ages. Noah cultivated the vine and made wine immediately after the flood, but it is supposed that grain was first cultivated on the banks of the Nile, in Egypt. The invention of the plough must have been nearly coeval with the rising of grain. "The first plough," says Jahn, in his Biblical Archaeology, "was nothing more than the stout limb of a tree, from which projected another shortened and pointed limb. The further end of the long branch was fastened to the yoke, and a handle was added by which the plough might be guided." Mr Loudon says the plough originally used was of the pick kind, and he gives a figure of one on an ancient medal dug up at Syracuse, which resembles a pick-axe. The letter A (alpha) is supposed to have its shape from the plough; in the most ancient form of the Greek A, one branch (the beam) is twice as long as the other (the share).—Another ancient plough figured by Mr Loudon is in the form of a sharp toad-boot the holder (a female) has one hand on the top of the boot and a beam is inserted a little above the instep. The instrument, now used for ploughing by the nations of the east, is similar to those of the ancients. Mr Loudon remarks, that the state of agriculture, and other arts, and of machinery, in the eastern countries was not materially different in the time of Moses, 3400 years ago, from what it is in the same countries at the present day. In Persia the lower part of the plough is a long wedge-shaped thing, and the beam and handle are inserted in the top of this block; in some districts the driver stands on the wedge or share. In Hindostan the ploughs are of the thick shape and are but little better than pointed sticks. The figures of some of them resemble the brush scythe of the American farmer, the blade being used for a share, and the handle for a beam—they are guided by a piece of wood attached to the beam near the share. The Hindoo ploughs merely scratch the earth, and to accomplish the work of pulverization, the plough repeats the operation from five to fifteen

times.—The Chinese ploughs are simple, and some of them are drawn by women.

The ancient Greek plough, described by Hesiod, consisted of three parts—a long block sharpened at the point; a draught pole attached obliquely to the upper part of the block, and extending to the yoke; and a plough tail to direct the implement, fastened in like manner, and extended back. A plough of a similar construction is now used in Sicily. The plough of the modern Greeks has a crooked share, shaped like the claw of an anchor; it is only a continuation of the sloping handle, which is large and strong. The most ancient plough used by the Romans, was of the simplest form. In the days of Virgil this implement had become more complicated and efficient. They had ploughs with and without mould-boards; with and without coulters; with and without wheels; with broad and narrow pointed shares. The beam was fastened to the yoke, like our cart-pole. The Romans did not plough their lands in beds or ridges, as we do; but the cattle always return in the same furrow. The plough commonly used had no mould-board, and this may be remarked of the ploughs of most ancient, and some modern nations.—*Hamp. Gaz.*

A LONDON BREWERY.

An idea of the immense extent to which the brewing of porter is carried on in London, may be formed from the following description of Barclay's brewery. If any private concern in England, or in the world, is entitled to the epithet of *vastness*, this is one. It covers about eight acres of ground, and manufactured last year 351,474 barrels, of 36 gallons each. The buildings which contain the vats themselves, are enormous. The largest of the latter contains each 4,000 barrels. The average number of vats is nearly 100. A steam-engine of 22 horse power is employed in driving the machinery, and about two hundred men are engaged in the various works of the establishment: it is supposed that the number of persons dependent upon it without doors, in the sale and transportation of the beer, is three or four thousand. The three coppers in which the beer is boiled, hold each 150 barrels.

Twenty-five gentlemen once dined in one of these coppers, after which, fifty of the workmen got in and regaled themselves. One hundred and ninety pounds of beef-stakes, were thus consumed in one day, in this novel kind of dining room.—The tuns in which the beer ferments, hold 1,400 barrels each. The carbonic acid in one of them stood about three and a half feet above the liquor, and poured over the side in a continued stream. A candle is instantly extinguished on being placed near the outer edge of this receptacle, and on holding one's face near it, a sharp pungent sensation is felt in the mouth and face, not unlike that produced by ardent spirits. An immersion of a few moments would be fatal.

One hundred and sixty horses are kept on the premises, for the purpose chiefly of transporting the materials to and from different parts of the city. A finer collection of animals employed in one concern, perhaps is no where to be seen.

This is, upon the whole, I believe, the largest brewery in London. It formerly belonged to Thralk, the friend of Dr. Johnson, who, as executor to the estate, sold the establishment to its present owners. One of the latter informed a friend of mine, that the Doctor, in treating with

them for the purchase, remarked in his characteristic manner: "Gentlemen, it is not merely these boilers and these vats that I am selling you, but the *potentiality* of acquiring wealth beyond the dreams of avarice." [English paper.]

CULTURE OF SILK.

In a part of New England where the silk worm has been an object of attention for a longer time than in most parts of the country, the little German settlement on Ebenezer creek, in Georgia, excepted, some new modes of cultivating the mulberry are introduced. I am informed that several of the "seed farmers" sow their seeds broad-cast like turnips, in the spring, and in the following season cut the plants with a scythe as soon as the worms begin to eat out of the *cocoons*. This mowing is regularly prosecuted every morning in the quantities wanted, and unless the season is one of severe drought, the fields will be cut twice or thrice before the worms begin to wind up.

The advantages stated of this mode are these:

1. The leaves are gathered with less labor and expense, being cut and taken together like hay or grain.
2. The leaves are larger and more tender than on the grown tree, and the worms eat with more appetite and produce more silk.
3. The time of gathering the supply is so short that the leaves are got with the morning dew upon them, which is deemed by practical men, to be an essential advantage.

4. More worms can be supported from a given space of ground, and the mulberries are ready after one season, instead of waiting several years for the formation of an orchard.

My informant who took pains to make minute inquiries on the spot, stated in one instance where the worms tended by one young woman, supplied with leaves in the mode described, produced silk to the value of \$400 in one season.—*N. Y. Times*

When an animal has eat too much green herbage, it ferments in the stomach and produces carbonic acid gas, which occasions bloating. To destroy this gas, make the animal swallow a spoonful of ammoniac mixed with a glass of water.—Perhaps a dose of lye would do as well.

Simon Leroy, of Mexico, Oswego county has invented a machine for mortising carriage hubs, bedstead posts, table legs, chair pillars, &c. &c It is small, costs \$29 and with it a boy of 14 years can do as much work in a day as six men without it.

THE CROPS.

The crops to the distance of twenty miles around us, wear a most flattering appearance, and promise an overflowing harvest. Providence in its beneficence gives every assurance of an ample compensation being made for the dearth of the last year.

Hatifax Nova Scotia.

Pear Trees.—During the two last years the pear trees were affected with a disease, which withered their foliage, suspended the circulation through the branches, and left the marks of death and decay to attest its destructive power. Many attempts at explanation were made. One distinguished agriculturist attributed the blight to the operation of an insect preying on the heart. Others considered it as the result of a suspension of circulation occasioned by the extraordinary dryness of the season. It has recently been attrib-

ed to the exhausted condition of the tree, following rapid growth or abundant production of fruit. That the latter cannot be the correct account of the source of that evil, so destructive to the orchard, is evident from the fact, that trees which have never produced fruit are sorely afflicted, and those whose growth has been slow, are miserably withered, while others, whose branches have been bent with the weight of the delicious harvests, in successive seasons, flourish in health and vigorous resplendency. To whatever cause the origin of the evil is to be attributed, there seems no doubt existing of the measures to be adopted to check its progress, if not work its cure. All writers agree, that the pruning knife must be used on the affected parts, with unsparring hand, and, the diseased branches cut off as soon as possible. The operation, where the blight has fastened itself firmly, is one of melancholy effect on the beauty and symmetry of the tree, and rendered more dangerous from the season when the wounds it occasions are exposed to the burning sun of summer: but the preservation of the life of the tree may well be procured by the sacrifice of fair proportions and goodly shape.—*Worcester. Egis.*

Novel Application of Electricity, or New way to pay Old Debts.—A certain physician who possessed a powerful Electrical Machine, discovered a sheriff making rapid strides towards his house: and suspecting from circumstances that he had some designs on his personal liberties, the worthy M. D. made preparations accordingly to ward off the anticipated attack. Attaching a conductor (from his electrical apparatus) to the knocker on the front of the door, he then charged the machine to a very high degree, and waited the result.—The steps which ascended to the front door had an elevation of fourteen feet. Clothed in all the importance of the law, the sheriff ascended, and with a firm grasp seized the fatal knocker. Instantly he found himself at the bottom of the steps. After having recovered in some measure from a blow given by an invisible power, and having collected his scattering wits and execrations, together with his senses, he made a second attempt, wondering at this strange manner of paying debts. Meanwhile the doctor had charged the faithful conductor. No sooner had the sheriff again dared to touch the fatal knocker, than he found himself twelve feet nearer the centre of the earth a second time. Remembering the old adage, "beware of the third time," he immediately quitted the premises, leaving the doctor in full possession of the "castle" he had so well defended.
Roll River Monitor.

Bunker-Hill Monument.—As much progress is now making with this great National work as a due regard to its firm and proper construction will admit. The base is completed, and the laying of the first course now occupies the attention of the architect, Mr. James S. Savage. The base we believe is forty feet square, and is from fifteen to twenty feet within the earth. At the surface it is about 24 feet square. In the centre a circular aperture is left from the first course of the base which is to extend to the top. Between the wall around the aperture and the outer wall, the stairs are to ascend in a circular form.

[Bunker-Hill Aurora.]

A new light House is about to be built at Buffalo—a light house on Lake Erie!

OATS.

Great complaint, we learn, has been made in the eastern part of the state of the failure of the crop of oats by *blight*. We are happy to say, that the farmers in this neighbourhood appear to be more highly favoured. We are informed by some of them, that their oats are as high as their shoulders and as thick as they can well stand together.—Nor is this goodly prospect likely to end in mere *straw*. On the contrary, as far as our inquiries and observations have extended, we have reason to believe that this species of grain, hereabouts, will turn out remarkably plump and heavy.

A failure in the crop of oats in a given section of the country is, perhaps, more severely felt than that of any other grain, because each section is accustomed to depend on itself for supplies, and not on importations, as of other kinds of grain.—Vast quantities of oats are consumed annually at the livery stables, at taverns, and by stage proprietors; and it is thought that no other grain could be substituted for them, which would be equally convenient in its use, and equally healthy and pleasant for horses. It is estimated that the several lines of stages, which run from Boston to Albany alone, consume 100,000 bushels of oats in a year. The farmer never wants a market for this kind of grain, and there is no other crop which he is so certain of turning into cash.—*Berk. Amer.*

Terrapin.—There is now in the possession of Mr Seth Swift a large terrapin, taken from an island in the Pacific Ocean, and brought to this place by the ship Alexander. It is so powerful, that, bearing a man weighing 250 pounds, it moves without the least apparent difficulty. The terrapin is a curious animal. None are more familiar with its habits and history, or have derived greater advantages from it as food, than the whalemen. It has often been known to live a year without aliment, and even then to be luxurious food.—Several islands of the Pacific abound with it, and the fishermen, after having been confined to their homely and monotonous food, have enjoyed in a high degree the meat of the terrapin. Hundreds have often been taken on board a single ship, (in some instances weighing a ton each,) and daily been served up to the crew—a luxury which epicures would "delight to honor." Luxuries pall upon the taste, but the terrapin is an exception. Never can the terrapin, although served up day after day for months, be rejected.
[Nantucket paper.]

The Harvest.—Our farmers this season have been blest with plentiful crops of every kind of grain and grass, and all we believe have been successful in housing and stacking it without injury in the least. So bountiful a display of the goodness of Him who ruleth ever all, calls for united thanksgivings; and whilst other nations are pining in misery and want, plenty sheds her stores abroad over our land, and abundance is every where the reward of industry.—*Penn. Gaz.*

Effects of Ardent Spirit.—Two persons near Red River, in Louisiana, lately made a bet which should drink the greatest quantity of ardent spirit. A gallon of whiskey was procured, and they both commenced, drinking by turns the contents of a tumbler. The gallon in a few minutes was gone; and the person who proposed the bet went for more; but on his return found the other lifeless.

Origin of Diseases.—"I tell you honestly what I think is the cause of the complicated maladies of the human race; it is their gormaulding and stuffing and stimulating those organs (the digestive) to an excess, thereby producing nervous disorders and irritation. The state of their minds is another grand cause: the fidgetting and discontenting yourself about that which can't be helped; passions of all kinds—malignant passions, and worldly cares, pressing upon the mind, disturb the brain, and do a great deal of harm."

"Lord Erskine," says Dr. E. Clarke, "told me that Burke's manner was sometimes bad; 'it was like that of an Irish chairman.' 'Once,' said he, 'I was so tired of hearing him in debate upon the India bill, that not liking he should see me leave the House of Commons while he was speaking, I crept along under the benches, and got out, and went to the Isle of Wight. Afterwards that very speech of his was published, and I found it to be so extremely beautiful, that I actually wore it into pieces by reading it.'"

NEW ENGLAND FARMER.

BOSTON, FRIDAY, AUGUST 24, 1827.

GARDENING.

The love of gardening is so natural to man, as to be common to children, and the enjoyments of a garden so congenial to our ideas of happiness as to be desired by men of all ranks and professions, who toil hard in cities, heping, with Cowley, one day to retire to a "small house and large garden." The cares of a garden are a source of agreeable domestic recreation, and especially to the female sex; to the valetudinarian they are a source of health, and to age a source of interest: for it has been remarked of a taste for gardening, that, unlike other tastes, it remains with us to the latest period, and increases rather than diminishes.

A statement appears in the last National Intelligencer of the health of Washington, the Capital of the United States, compared with Baltimore, Philadelphia, New-York, and Boston: by which it appears that Washington is a very healthy city. The deaths there are said to be one in fifty, while in Boston they are one in forty-one—in New-York, one in thirty-seven—in Philadelphia, one in thirty-two; and in Baltimore, one in thirty-eight.

From the 1st of Jan. to the 1st of Aug. 1827 10134 passengers arrived at New-York by water 15,000 arrived at Quebec—and probably 5000 at other northern ports—making over 30,000 emigrants to America in six months.

Thames Tunnel. A meeting of the shareholders of this institution was held, at the London Tavern, on the 19th of June, when a report was read from Mr Brunel to the Directors, on the subject of the late accident. This contained a statement in detail of the difficulties, which had attended the undertaking, but expressed strong confidence in eventual success.

A company of merchants at Natchez, Miss. has offered premiums of \$50 for the best sample piece of Cotton Bagging: \$25 for the best pair of blankets, and \$25 for the best of Denim for negro clothing.

Miscellaneous.

SACRED LYRIC.

BY JAMES EDMESTON, LONDON

Where can I go from Thee!
All present Deity!
Nature, and Time, and Thought, thine impress bear
Through earth, or sea, or sky,
Though far as I fly,
I turn, and find Thee present with me there

The perfume of the rose,
And every flower that blows,
All mark thy love, in clusters of the vale
The corn that crowns the fields,
The fruits that garden yields,
Proclaim the bounties that can never fail

The vapor and the cloud,
The thunder bursting loud,
Speak of Thy majesty in words of flame,
The ocean as it roars,
Lashing the rocks and shores,
Declares from what a mighty hand it came

The vasty globes that roll,
Each on its own firm pole,
Through all the boundless fields of space roam
From the audacious Thon art,
The life-wheel and the heart,
Of systems to our little world unknown

From Thee I cannot fly,
Thine all observing eye,
Marks the minutest atom of thy reign,
How far so'er I go,
Thou all my path wouldst know,
And bring the wanderer to this earth again

But why should I depart?
'Tis safety where Thou art,
And could one spot thy being hold,
I, poor, and vain, and weak,
That sacred spot would seek,
And dwell within the shelter of thy fold

FISH PONDS.

These are considered to be no small improvement of watery and boggy lands, many of which can be appropriated to no other purpose.—In making a pond, its head should be at the lowest part of the ground, that the trench of the flood-gate, or sluice, having a good fall, may, when necessary, speedily discharge the water. The best method of securing the work, is to drive in two or three rows of stakes, at least six feet long, at a distance of about four feet, extending to the whole length of the pond-head, the first row of which should be rammed not less than four feet deep. If the bottom be false, the foundation may be laid with quick-lime; which, slacking, will make it as hard as a stone. Some persons place a layer of lime, and another of earth dug out of the pond, among the piles and stakes; and, when these are well covered, drive in others as occasion may require, and ram in the earth as before, till the pond-head be of the height designed.

The dam should be made sloping on each side, and a waste left to carry off the superabundant water in case of floods or rains: the depth of the pond need not exceed six feet, rising gradually in shoals towards the sides, in order to allow the fish to sun themselves and deposit their spawn. Gravelly and sandy bottoms, especially the latter, are well calculated to promote the breeding of these animals: and a fat soil, with a white rich water, such as the washings of hills, commons, streets, sinks, &c. is said to be the most proper for fattening all sorts of fish.

For storing a pond, carp is to be preferred, on account of its delicacy, quick growth, and prolific nature, as it breeds five or six times a year. This fish delights in ponds that have marl or clay bottoms, with plenty of weeds and grass, on which it chiefly subsists during the hot months.

In a late publication, we meet with the follow-

ing singular method of furnishing a fish pond with a variety of fish. About the latter end of April, or the beginning of May, take the root of a willow that stands near the water side, and is full of fibres; wash off the earth which adheres to it, then fasten it to a spike, and drive it into a river or pond well stored with fish; they will speedily be induced to deposit their spawn or roe in the fibres of the root. After a few days, (in cool weather, perhaps weeks) remove the spike, with the willow root, from the pond, and convey it to that which you design to store, driving it to the depth of four or six inches under the surface of the water; and, in about a fortnight, a great number of young fish will appear. The root, however should not be left too long in the first pond or river, lest the heat of the sun animate the spawn, and disengage it from the root.—*Domestic Encyclopedia.*

Forgetfulness. A gentleman who had a short memory, wrote in his pocket book: "Mem.—to marry next Thursday." As a proof that this precaution was not altogether useless, Mr B.— who had married in the morning, went to bed at night in his usual lodgings. And it is related of Mr Harvost whose character is drawn by Bickerstaffe in the comedy of the *Absent Man*, that having appointed a day to be married, he entirely forgot it, and went a fishing.

A Wife.—In the new piece of Love and Reason, old General Dorlan is persuading Adjutant Vincent to marry. "She is an angel!" says the General: "I don't want an angel—I shouldn't know what to do with an angel," was the reply of the single hearted Adjutant. "She is all sweetness," rejoines the General: "So is a beehive," answers Vincent, "but it does not follow that I should like to thrust my head into it."

Swallowing a Sword.—The Colonel of a regiment was informed lately that one of his men had run his sword through his body. On enquiry he found that he had sold his sword to buy spirituous liquors.

Bull. A Hibernian schoolmaster advertised that he intended to keep a *Sunday school twice a week, to wit Tuesdays and Thursdays.*

Trifles, says Voltaire, produce often great effects: a glove, dropped by Queen Anne, and picked up by Mrs Masham, drove the Whigs, headed by the Duke of Marlborough, out of office.

Gen. LAFAYETTE has been elected a Member of the Fr. Chamber of Deputies. The General is said to have had 281 votes—his antagonist, Mr Trenchon, 109.

A paper entitled the "Pool-strike," is said to have been commenced in Prussia—in which probably are published all accounts of duels—ruins by gaming and speculation—deaths for love—accidents from intemperance, &c. &c.

Fever and Igua.—Take 2 ounces of Peruvian bark, 2 of powdered cloves, and 1 of cream of tartar: mix them together; divide the composition into 12 equal doses, and take one dose every morning noon and night till the complaint is checked: then one every morning till the whole is taken. Each dose may be taken in a glass of any kind of spirituous liquor mixed with water.

TO THE FARMERS OF THE UNITED STATES.

Gentlemen.—You have raised abundance, and a variety of forage for cattle, but there is one species of herbage of which the horse, the cow and sheep are particularly fond, and which is wonderfully productive; that to which I have reference is called Tares. It grows early in the spring, and should the grass crops fail, it is found to be an excellent substitute; cattle will soon grow fat by feeding on it. I presume the seed could be imported from England, it will grow on almost any soil—in the county of Sussex, I have seen hundreds of acres on the South Downs, where the mould has not been more than six inches deep. The farmers sow it and sell it to those that own horses and cows, by the acre, half acre, or quarter; the purchaser mows it down and carries it home at his own expense.

A short time past, I was conversing with an English farmer, that had known well the value of Tares, and he told me that he should import the seed; a few bushels will sow a large quantity of land, and the seed should be preserved from the crop. The farmer that I alluded to died shortly afterwards.—*N. Y. Daily Adv.* W. C.

How to preserve ready made Coffee good for a considerable time in bottles.

(Abridged from Count Rumford's Essays.)

The bottles having been made very clean, must be put into clean cold water in a large boiler, and the water must be heated gradually, and made to boil, in order that the bottles may be heated boiling hot.

The coffee, fresh prepared, and still boiling hot, must be put into these heated bottles, which must be immediately well closed with good sound corks.

The bottles must then be moved into a cool cellar, where they must be kept well covered up in dry sand, in order to preserve them from the light.

By this means ready-made coffee may be preserved good for a long time, but great care must be taken not to let it be exposed to the light, otherwise it will soon be spoiled.

An Infallible Barometer. Put two drachms of pure nitre, and half a drachm of chloride of ammonia, reduced to powder, into two ounces of spirit of wine, or pure alcohol, and place this mixture in a glass tube, ten inches long, and eight lines in diameter, the upper extremity of which must be covered with a piece of skin or bladder, pierced with small holes. If the weather is to be fine, the solid matter remains at the bottom of the tube, and the alcohol is as transparent as usual. If rain is to fall in a short time, some of the solid particles rise and fall in the alcohol, which becomes somewhat thick and troubled. When a storm, a tempest, or even a squall is about to come on, all the solid matters rise from the bottom of the tube, and form a crust on the surface of the alcohol, which appears in a state of fermentation. These appearances take place 24 hours before the tempest ensues; and the point of the horizon from which it is to blow is indicated by the particles gathering most on the side of the tube opposite to that part whence the wind is to come.

THE FARMER is published every Friday, at \$3.00 per annum, or \$2.50 if paid in advance.

Gentlemen who procure five responsible subscribers, are entitled to a sixth volume gratis.

AGRICULTURE.

MILLET.

Mr FEsSENDEN.—In Agriculture, as in all practical sciences, facts are much more important than theories; and it is the duty of every farmer to communicate the result of his experiments. A plain and exact history of his cultivation will be useful to himself and to others; and it would be well for him to remember that it may be as useful to record his failures as his successes.—I give you the history of a small Millet field.

The land is a moist good soil; and measures seventy-two square rods. It was planted last year with potatoes, very slightly manured with rock weed in the drills, and yielded a poor crop. It was manured this year with slaughter yard and barn manure mixed, at the rate of 2½ cords and three fourths to an acre; that is 336 cubic feet of manure were put on the piece and ploughed in. It was sowed with seed obtained at the New England Farmer office, and rolled on the 14th June, at the rate of 5 pecks of seed to the acre. The field was mowed on the 19th inst. and carried in yesterday weighing 3090 lbs. at the rate of 6906 lbs. to the acre. It was cut as soon as some of the seeds would shake out when rolled in the hand; and from experience heretofore, I deem it quite equal to my best English Hay for any kind of stock.

Yours respectfully,

H. C.

Salem, August 25, 1827.

INSECTS.

Mr. FEsSENDEN.—With a view to confirm the facts, respecting the insect, which preys on the cut-worm, (partially described in the N. E. Farmer, page 313, vol. 5th,) the following remarks are made.

This season my plants were visited as usual, by the cut-worm; but not in such crowds, as in the last year. They however, succeeded in destroying many plants, until about the 10th of June, at which time, their great enemy, the cut-worm destroyer appeared, and in sufficient numbers to put a stop to further depredations. I had frequent opportunities of witnessing the prowess of this insect in the destruction of the larvæ, which prove so troublesome to the gardener.

These new insects are of different sizes, from half, to more than an inch in length. They are provided with 6 small legs, placed near the head. They are quick in motion, and their whole complexion is black. They lie just beneath the surface of the earth. When this insect seizes a cut-worm, that lies near the top of the earth, the exertions of the latter to disengage the assailant are such, as to bring both into view on the surface.

On the 12th of June, P. M. one of these insects of more than ordinary size was put into a glass vessel, and three cut-worms were placed with him. He not only killed, but nearly devoured them in the course of the afternoon. The next morning, the glass vessel was half filled with earth, and 14 cut-worms (none very small, some large) were put into it. They soon crawled into the earth. In the evening the earth was examined; and it was found, that the *avenger* had de-

stroyed 10 of the number, some of which he had considerably eaten. The next day he disposed of the remainder in the same manner. He was then kept fasting, and after thirty-six hours had elapsed, a very large larva of the earth-beetle (called, dorr-bug) was put with him. At first, he made some faint attempts to fasten on the worm, but did not, until forced by famine—he slew the victim, and feasted on the carcass.

Mansfield, August 3, 1827.

R. GREEN.

Mr FEsSENDEN.—Had not your correspondent suffered severely by the ravages of the insects, called rose-bugs, he never should have attempted an investigation of their habits and mode of economy. And now he regrets, that after much research, he is not able to present you with something, that might prove an effectual antidote.

Mansfield, May 28, 1827.

R. GREEN.

REMARKS ON THE SCARABÆUS ROSE-US, OR ROSE-BUG.

The writer will not trouble himself, nor the reader with vague opinions, as to the origin and final exit of the insects in question; but bring in to view such facts as have come under his observation: neither has he a wish to trespass upon the province of the entomologist; but from several considerations, having seen no specific name by which they are called, he is disposed to depart from the path generally pursued, and call the insect, *Scarabæus Roseus*, a name sufficiently significant for his purpose. If others prefer a different name, they are at liberty to select, and to make use of what they please. The insect, however, belongs to the *Scarabæus* family, in the order, *Coleoptera*, according to Linnæus. More modern entomologists have subdivided this family or genus, and given different names to the subdivisions, but facts are the same.

An individual rose-bug is unimportant, otherwise than it regards science, but collectively they are a potent enemy, and unavoidably arrest our attention, especially, when they assail us on all points, our interest, our comforts, our pleasures, and intrude on our persons.

These insects appeared in this vicinity some time during the revolutionary war with G. Britain. They were first observed on rose bushes, and from this circumstance they were, almost universally, called rose-bugs. At first, their increase was slow, and the injury done was small; but they have of late years greatly increased, and their depredations have been great, extensive and alarming. In many places their ravages were such the two last seasons, as to warrant the conclusion, that, if they should increase for two or three years to come, in the same ratio, as they have increased for the two years past, scarcely a green thing, on which they prey, would be left unutilated. They are voracious, especially when they first appear, and not very delicate as to their food. They prey upon many kinds of plants, shrubs and trees, but especially on rose bushes, the nice varieties of the cherry tree, grape vines, plum trees, apple trees and almost all kinds of young fruit as apples, peaches, apricots, nectarines, &c. Indian corn, beans, clover, many forest trees

and shrubs, not excepting the shrub-oak, suffer from their ravages. They are fond of flowers, especially the flowers of the rose and grape, both of which they soon destroy; and by them the verdure and beauty of a garden are laid in ruins.

As to the time of their annual appearance, there is some variation, depending on the warmth of the season. In 1825, they appeared on the 8th day of June, and by the 12th, they were very numerous and so continued for several days. By the 28th, the number was comparatively few and depreciated daily, until the 8th of July, after which none was observed. In 1826, a few appeared on the 31 of June, (weather warm, and dry,) and on the 4th, they were numerous. On the 8th, they were more numerous than ever known before. The weather was very warm, the thermometer at 4 P. M. stood at 93° in the shade. In the garden of the writer, the atmosphere was literally alive with the insects, which from their great numbers made a general hum, similar to that of the swarming of bees. The wind was from the west, but the insects came from the east, against the wind, and none is recollected to come from any other direction. The fragrance of the garden, (there being at that time, many plants in flower) was carried by the wind to some distance, and undoubtedly invited them there. They were very numerous for several days, but by the 21th, they were less so, and decreased from day to day. By the 9th of July very few were seen, and after that time only an individual was now and then observed, and none after the 21st appeared. The cool weather and rains in the latter part of June, and the beginning of July, undoubtedly, protracted their continuance. It is probable, that in other places, at some distance, there may be some difference of time as to their appearance and continuance, depending on local circumstances.

They are greatly influenced by the state of the weather. Their progress is accelerated by heat, and retarded by cold. In a warm day they are active, but in a cool one, especially if it be wet, they are languid and move but little. About 9 o'clock, A. M. in fair warm weather, they begin to move from place to place in quest of food and company, of which they seem excessively fond, and by 10 A. M. or before, they are found in pairs, and frequently collected in great numbers, from 2 to perhaps 20 or more on a single leaf. Eighty-six of these spoilers were known to infest a single rose bud, and were crushed with one grasp of the hand. As the evening approaches, if it be cool, they become still, but if the night be very warm, they feed and occasionally travel a small distance, but do not make use of their wings. If after a rain the sun break out warm, they are very active. When shaken from a tree in the cool of the evening, or at any time when they are wet with dew, they fall on the ground and crawl to the tree, or anything else standing near, and ascend, as they cannot under these circumstances make use of their wings. In a scorching sun they seek a shady place, and frequently collect where there is a cluster of leaves. When they settle on a plant, shrub, or tree, they seem generally, disposed to stay on the same, until they have destroyed the foliage, and then resort to others. They may not

all have an equal relish for the same kind of food. Some may prefer one kind of vegetable production, and others a different kind. However, be this as it may, they are, when they first appear, omnivorous, having taken no food during the chrysalis state.* They do not prefer the foliage of the peach tree, nor that of the pear tree, but will occasionally feed on both. In 1825 they destroyed the foliage of a thrifty mountain ash, and essentially injured it; but in 1824, they scarcely noticed it. In a few days after their first general appearance, especially if the weather be cool, they seem to be less numerous, but this is, perhaps, not the fact any farther than they may be destroyed. At this time they become more stationary, probably devour less, leave some plants or trees and assail others, yet the work of destruction goes on.

The leaf is an important organ, and when a tree is stripped of its foliage in the month of June, unless it be otherwise healthy and vigorous, it dies, or at least declines. In my garden stood a number of young, promising cherry trees, which had been inoculated. They were assailed by the ravagers and robbed of their foliage—debility and decay ensued—a few, however, survived this shock, and put forth leaves the ensuing spring—but a new crop of intruders came, and it was fatal.

These insects, like many others, pass three different stages, the egg, the larva and the chrysalis, before they arrive to the mature or perfect state. A general description may be necessary, and will be now attempted.

These insects in their perfect form are nearly all of a size, about 4 lines in length and $1\frac{1}{2}$ through the middle of the body, which is covered with a crustaceous substance, overspread with minute pointed bristles of a light brownish yellow, only conspicuous under a magnifier. There is but little difference in the general appearance between the male and the female, excepting the latter is a little larger than the former. The posterior segment of the body, or apex of the males is longer and larger than that of the female, and the dark line dividing the apex from the other part of the body is most conspicuous in the former.

The head is flattish and the eyes are black, prominent and immovable. The *antennae* are beautiful organs, (viewed through a microscope,) jointed, moveable, small at the articulation, near the eyes, and at the extremity, an oblong club, which is divided longitudinally into three portions. These portions the insect opens and shuts horizontally, at pleasure, when moving from place to place.—The thorax is broad, hexagonal and convex. The *elytra* (wing-cases) are divided by a straight longitudinal suture, covering the back, leaving the posterior part naked. These are articulated to the anterior part of the back, and are raised up, as on a hinge, to admit the expansion of the wings. The *scutellum* lies between the superior parts of the *elytra*, and is in form triangular.—The wings are two, and lie directly under the *elytra*, folded up by the nicest articulations, membranous, transparent, and show some light shades of red and green in the sun. When unfolded, they extend beyond the length of the body. The abdomen is formed of annular segments, and contains the viscera. The legs are six, long and well jointed, formed of a crustaceous substance of

a reddish yellow, or light chestnut colour, blackish joints. Each *tibia* is armed with dark thorns, and each *tarsus* has 5 joints, furnished with thorns, and at the extremity, two curved claws. The two anterior legs are articulated to the under part of the thorax, the two middle ones, to the anterior and under part of the abdomen; and the two posterior which are longer and larger than the others, to the under and central part of the same; and with the two last named, they have, when disturbed, a contemptuous motion of throwing them over their backs.

They, like most other insects, are oviparous, and deposit their eggs below the surface in moist, light earth, and in grass land. The depth of deposit is from near the surface to 3 or 4 inches, according to the state of the soil. The eggs are about one thirtieth of an inch in diameter, white, contained in a transparent membrane, of sufficient strength. When they have performed their last work, which is the preparation for a new crop, still more numerous, they, both male and female, in a short time, perish by exhaustion, some in the earth and some above it.* With respect to the time when an individual deposits her eggs, there is some variation. Some perform this office sooner than others; but from a variety of experiments made by placing the insects, male and female, in pots of earth, kept moist, covered with millinet, fed and exposed to light and proper heat, and the frequent inspections of the bodies of the females, carefully made, it is thought, they generally perform that office in about 20 days from the time they emerge from the earth, but in different places and at different times, occupying the space of 2 or 3 days, more or less. It is an unhappy circumstance, that they occupy so much time before they can complete their object. Time, however, is necessary for the eggs to become matured. If the body of a female be inspected soon after her emerging from the earth, the eggs will be found, by the aid of a magnifier, to be in a confused mass. After a few days they will be more distinctly seen, some more perfected than others, and as the period of oviposition approaches, the eggs approach to maturity. In about 20 days the eggs are matured, distinct, and a little oblong, but after they are deposited, become round, or nearly so. The number of eggs found in an individual have never exceeded 30, generally below twenty.

To be concluded next week.

FOR THE NEW ENGLAND FARMER.

ON PEACHES, &c.

MR FESSENDEN.—Among the luxuries which are the produce of our climate, the peach is one of the most valuable, but, in years of great abundance, as the present is likely to be, large quantities of this delicious fruit are suffered to go to waste on the ground, or even prostituted as food for swine. I wish to invite my brother farmers to lay by, in reserve for another year, the superabundance of the present season, which may be done by drying in the sun all the fruit which they will not be able to dispose of to advantage.

In plentiful years, none but the finest will pay for marketing; and many fall and get bruised.—This refuse fruit I invite them to dry, which may be done by splitting, taking out the stones, and exposure to the sun. The day after they are put

* At the time, when "taking leave of absence," they were found, male and female, 2 or 3 inches below the surface of the earth, and in one instance, *sub copula*.

out, and have got withed, the work of desiccation may be considerably advanced by pressing the outside of the pieces with the finger, so as to push out the inside, and thus exposing it better to the effect of the sun. They may be laid out on milk pans or pieces of boards, but if the quantity of fruit to be dried be considerable, I have used with much convenience dryers constructed as follows. I have taken pine slats about one inch square, and nailed on them shingles, so that my dryers are the width of the shingles, and about four feet long; refuse shingles answer the purpose very well, and they may be nailed on with cut tacks: these dryers have the advantage of lightness and cheapness, and they are quickly made. They may be laid on the roof of a shed, and should be housed at night, before the dew falls.

If the weather comes on wet, the fruit will be liable to moulder; in that case, it must be finished in an oven heated moderately. Peaches well dried in this manner, will keep in paper bags in a dry room, and be good the third year.

They are a luxury as a dried fruit, and will also make excellent pies. For this purpose it is a great improvement to soak them in a little water, or yet better in currant wine, 6 hours before they are wanted for baking.

PEACH WINE.

The refuse fruit may also be used to good advantage for the making of wine, which I have done in the following manner. After taking the stones out, the fruit should be well mashed with the hands, thrown into a boiler with a sufficient quantity of water, well boiled and kept mashed so as to get it to yield its juice. When boiled enough, it should be worked through a sieve to get the liquor as clear as possible; and for that purpose the sieve should be often washed in cold water. Add then good Havana sugar enough to have it pleasant, and let it rest twelve hours for the sediment to settle at the bottom; and to the clear liquor add of good brandy 2 or 3 quarts for a barrel—then barrel it, and bung it down. This is of the nature of the French boiled wines, *Vins cuits*, *Vins de liqueur*, and if well managed is a most excellent wine, both for its great substance and its superior flavour.

LIQUOR FROM THE STONES.

The stones may be used for the making of a liquor which will be found equal to the best imported *Noyeau*. They should be broken immediately after being taken out, and whatever of the fruit adheres to them should be left on. The almonds which they contain should also be bruised, and both shells and almonds then put into a demijohn, or other vessel, until it is two thirds filled—then filled up with good brandy. After six months the liquor may be decanted clear and sweetened with white or loaf sugar. It will improve by age.

There can be no doubt but the dried fruit, the wine, and the liquor would be made welcome to a ready and profitable market in the City, and that the dried fruit would be particularly well adapted for cabin use in long voyages.

With much esteem,

Your friend and servt, J. M. G.
Weston, August 27, 1827.

REMARKS.—To the above judicious article we add the following from the New England Farmer's Almanack, (advertised in this day's paper). The article is written by a gentleman in New Jersey, and describes his peach house.

He has a small house with a stove in it, and drawers in the

* It is admitted, that they, on taking the "VITI," the chrysalis state, carry with them all that is necessary for that state of seclusion; but eventually, their stores are exhausted by the astonishing process of metamorphosis, which is carried on, and they emerge from the earth with strong appetites.

Sides of the house, lathed at the bottoms. Each drawer will hold nearly half a bushel of peaches, which should be ripe, and not needed, but cut in two and laid on the laths with their skins down towards us as to save the juice. On showing the drawer in, they are soon dried by the hot air of the stove and laid up.—Peaches dried thus eat like raisins. With a paring machine, one may be had for a dollar or two, apples or pears may be pared, and sufficient quantity dried to keep a family in pies, and apple bread and milk, till apples come again. With a paring machine, one person can pare five or six cutters.

ARTIFICIAL PONDS.

Pastures that are destitute of water, should have artificial ponds made in them, for watering places.

“Observe where rushes, reeds, flags, and other aquatic plants grow spontaneously; or where frogs are observed to lie squatted down close to the ground in order to receive its moisture. Or observe where a vapour is frequently seen to rise from the same spot. Some say, whenever little swarms of flies are seen constantly flying in the same place, and near the ground, in the morning after sun-rise, there is water underneath.”—“If a well is made in a sloping ground, and the declivity is sufficient to give it a horizontal vent, it will be worth the husbandman's while to dig such a passage, and by means of pipes, or any other conveyance, to carry the water across the light soil, through which it might otherwise sink. The greatest quantity of water will be obtained in this manner, because there will be a continual stream.” There is no difficulty in making a durable pond in a clayey soil. Let a large hollow basin be made in such earth, and it will preserve the water that falls in rain. But it is apt to be thick and dirty, if some pains be not taken to prevent it. The declivity, by which the cattle enter, should be paved, and gravel should be spread on the bottom. Or it might be better if the whole were paved.

There are many large natural ponds, which have outlets in one part, and are supplied by brooks or rivers in other parts; but a greater number of smaller ponds which are perfectly stagnant, unless when they are agitated by winds.—Such ponds as the latter, in hot seasons, are apt to become putrid, and contaminate the air about them. For this reason they should, if possible, be drained. And when the water is not deep, and an outlet can be made without too much cost, they should be drained for the sake of reclaiming the soil. This will be of great value, as it commonly is found to be extremely rich, being made up of the finest particles of soil, wafted into them by winds, and of decayed vegetable substances, besides the fine mould washed into them by rains.

Many farms contain little sunken spots, which are most of the year covered with water, and produce some aquatic bushes and weeds. These are notorious harbours for frogs; and are also called frog ponds. They should be drained if it be practicable. It is commonly the case, however, that draining them in the common way, by making an outlet, would cost more than they would be worth when drained, because of the height of the land on every side. But in this case if the banks be not clay, they may be drained in the following manner.

Take notice on which side land that is lower than the pond is nearest. On that side, in the bank near the pond, dig a kind of cellar, two or three feet deeper than the surface of the pond; do it in a dry season. If a hard stratum appear,

dig through it; and leave digging where the bottom is loose gravel or sand. Then make an open or a covered drain from the pond to the cellar.—The water will be discharged from the pond, and soak into the earth through the bottom of the cellar, till a scurf is formed on the bottom that will stop the water from soaking into the earth. This scurf should be broken from time to time, and taken away with a long handled hoe. Or, the cellar may be filled up with refuse stones, which I think is preferable to the other method.

If the pond should not then become sufficiently dry, a small ditch should be drawn round it, and discharge itself into the cellar. The land that is thus gained will be rich muck, much of which may be carted away for manure; and common earth, or sand, may replace it, without detriment to the soil.—*Deane's New England Farmer.*

BREAD.

The disease called dyspepsia has become so general and obstinate in this city, as to constitute one of the most terrible plagues with which we are afflicted. There is scarcely one in five among persons of sedentary habits, who are not more or less affected by it. We have no doubt the principal cause of its prevalence is the unwholesome nature of the bread in common use.—This, like many other articles of food, has been refined till its nutritious qualities are almost destroyed. For the sake of fineness and whiteness, the coarser, but more nourishing particles, are excluded from its composition; and it is wrought into a tough, dry, and indigestible substance, highly pernicious to the stomach. Fortunately for the health of our citizens, an opposition line of some extent in the baking business, has of late years been set on foot, for the making of what is called family bread. This, as it is not refined to death, may be eaten with safety. Another kind, of which large quantities are now baked, called bran bread, and made of unbolted flour, is the only one proper for confirmed cases of the dyspepsia, many of which have been cured by its use of it. Though brown and coarse in its appearance, it is quite palatable.—*N. Y. Mirror.*

Steam Boats.—In the summer of the year 1807, Fulton for the first time ascended the Hudson river from New York to Albany, in a boat propelled by steam. This was the first successful experiment of the kind ever made. In a letter that he addressed to his friend, Joel Barlow, under date of August 22, 1807, Mr Fulton observes:

“My steam boat voyage to Albany and back has turned out rather more favourable than I had calculated. I ran it up in 32 hours, and down in 30. The latter is just five miles an hour. I had a light breeze against me the whole way, going and coming, so that no use was made of my sails.” His boat was comparatively a rude structure, and his engine of small power. After a lapse of twenty years, we now witness numerous steam boats, capacious to an extreme, elegant in form and finish, and which, without much exaggeration, might be called floating palaces. But in swiftness, as well as in elegance, the progress of improvement has been great. Instead of five miles an hour, they now run at the rate of ten or eleven, and, in some instances, twelve.—*Alb. Arg.*

The *Hop Duty* (by which the product of the year is estimated) was stated to produce 95,000.

Boston and Providence Rail Road.—We understand that the Commissioners of the Board of Internal Improvement finished viewing the different proposed routes of the Boston and Providence Rail Road on Saturday last, and intend soon to commence the survey. For a greater part of the distance three and in some instances four, different routes have been proposed by the inhabitants of the different towns, and examined by the Commissioners,—the most westerly passing near the Wrentham meeting-house, and the most easterly, near the Mansfield meeting-house. It seems the route is not yet fixed upon, and will not be, as we understand, until some surveys are made for the purpose of making a more accurate comparison. It is however pretty satisfactorily ascertained, that a Rail Way may be constructed between the two capitals, without a variation of more than 25 or 27 feet in the mile from a level, excepting a distance of three or four miles about the middle of the route, where in the transportation from Boston to Providence, two horses will be required for the load that may be transported over the rest of it by one. From the summit of the route to Providence, the descent is gradual and pretty uniform, and it seems probable that no extra power will be required in this part of the route, in either direction. The route on the whole, is much more favourable than was anticipated.

The inhabitants on the different routes have given the Commissioners every possible facility and assistance in exploring the grounds, and though those of each town and neighbourhood are inclined to think favourably of their own route yet they all agree, in the most liberal and public spirited manner, that the best route should be selected, whether it prove to be their own or some other. The people of Providence and Pawtucket express their readiness to co-operate cordially and liberally in the undertaking, and no local jealousies or rivalships seem likely to throw any obstacles in the way of the enterprise, the only competition as yet exhibited, being a generous emula in its favour.—*Centinel.*

NEW INVENTION.

Mr Noah Safford of Springfield, Vt. has lately invented a Hydraulic Machine which bids fair to equal, if not exceed any thing of the kind. Its operation as a common pump is very easy and effectual, and leaves no doubt but it will be a powerful instrument for throwing water. Their simplicity and ease of construction is such, that they can be afforded very low. One of the largest dimensions and up to all necessary power probably will not cost much over \$100, the smaller at a much lower price.

SURGICAL.

A distressing case occurred last week, in the family of Mr Michael Metcalf, Jr. of this town.—One of the children, two years old, was playing with some kidney beans, one of which, half an inch in length, slipped into the trachea, or windpipe. This took place about 9 o'clock. The distress of the child increasing, it became apparent in the afternoon, that suffocation would soon end the sufferings of the little innocent. The parents then consented that the operation of bronchotomy, cutting into the windpipe, should be performed. This operation, by Dr. Twichell, seven hours after the accident, was completely successful and the child is now in perfect health.—*Keene paper.*

LUCERNE.

(Continued from page 36.)

After having completed the extracts from the Abbe Rozier on Lucerne, we met with an English work, which is still more full on the same subject; and as it would be well to put our readers in possession of so many facts, and of such a variety of authority, as wholly to satisfy their minds of the great value of this grass, we shall insert copious extracts from this English work, "The Complete Farmer," printed 1793.

Columella, an ancient writer, calls Lucerne the choicest of all fodder, because it will last ten years, and will bear being cut down four, and sometimes six times a year; it enriches the land in which it grows, fattens the cattle fed with it, and is a remedy for sick cattle. Yet notwithstanding it was so much esteemed by the ancients, and hath been cultivated to great advantage in France and Switzerland, for many years, it has not yet found so good a reception in England as it justly deserves; [this was written 34 years ago] nor is it cultivated here in any considerable quantity, though it will succeed as well in this country, as in either of the last mentioned, being extremely hardy, and resisting the severest cold of our climate. [This is as true in Massachusetts; it is hardier than Clover.] Mr. Roque lays it down as a maxim from his own practice, that Lucerne will grow on any soil, provided it be not too wet, to rot the roots. The strongest land is however to be preferred, and the deeper the soil, the better will be the crop. The land should be prepared in the same manner as for barley, and brought to a fine tilth. The Lucerne should be sown broadcast, in fine weather, at the rate of fourteen pounds to the acre. If grain is sown with it, it should only be for half a crop, otherwise it will be apt to destroy the Lucerne, especially if the grain should prove rank; but if no grain is sown with it, the Lucerne will be better. Lucerne may be sown from the beginning of March to the end of May. If you sow grain with it ever so thin, and it should prove luxuriant, it had better be cut green, lest it should hurt the Lucerne. The grain thus cut may be given to cattle green, or if properly dried will make excellent hay. Lucerne will not grow on newly broken-up land; it must be tilled a year or two; potatoes make the best preparation for Lucerne. In Languedoc they sow no grain with it; but they cut over the Lucerne when it is six inches high, so as to keep down weeds and other plants. In Normandy, whose climate resembles that of England, they sow grain with it. When the plants are a year old it will be proper to go over the ground with a large harrow, to root up annual weeds and grass. The harrow will not hurt the roots of Lucerne, they being very tough; this should be done in dry weather, before the Lucerne begins to sprout, and if there are any patches, where the seed miscarried, you can throw in a little seed upon them. The second year, you may run over your Lucerne with a smooth plough, without a coulter, to prevent the roots being too much hurt, and leave it rough a few days, then harrow it smooth. One not used to Lucerne would be apt to think that ploughing would ruin it, but experience shows the contrary. In making into hay, it should be cut as soon as the bloom appears; it must not be spread like other grass, but lie in the swarth, like Clover, and turned in the same manner, or the leaves,

which are most nutritive, will fall off. If suffered to stand too long before mowing, the stalks become too hard for cattle, and it loses much of its goodness. The hay is good for all sorts of cattle, and when horses are fed with it, they should not have their full allowance of corn; the Lucerne answers, in a great measure, the purpose of both hay and grain. It is also the most profitable fodder to feed horses with in summer by mowing, and giving it to them green. If the land is good, the produce is incredible. Mr. Roque says he has seen it mowed five times in a season, yielding, at the five mowings, eight loads of hay per acre.

As the duration of Lucerne has been a question of dispute, this author quotes the authority of an able cultivator. "As to its duration, it will last as long as the ground is kept clean. I saw some at Mr. Middleman's at Grantbam, in his garden, which was forty years old, and it was very fine." The Practical Cultivator says "It ought not to be cut except when it is in blossom, and that is but three times a year, but after mowing the third crop, instead of cutting a fourth, you may feed it, but when the frosts come you must take your cattle off, because they would bruise the young stalks. If it is rank in September, it is dangerous for cows, it being too feeding [hearty]; but turn horses and sheep upon it. As there is no grass, which has come to our knowledge, which gives the cows so much milk, you may let them graze in the afternoon when the dew is off, about one hour; when made hay it is likewise the best for milk; wherever it is much cultivated they prefer it to all other kinds of hay. When I was in Mousque, a city in Provence, the carriers fed their horses upon it, preferably to any other, without corn; and they were fat and in fine order. It is acknowledged to be the most feeding [hearty?] pasture, either green or in hay. I trust not barely to report, but have found it so myself. Many are apt to condemn it, but it is for want of knowledge. It has been introduced for a long number of years, but so little noticed that 21 years ago, [that is in 1772,] there were not 200 weight of Lucerne seeds to be sold among all the Seedsmen in London, and I had much ado to re-introduce it; but now, [in 1793,] there is a prodigious consumption of it."

[Note. The fate of this grass has been the same in the United States. More than twenty years ago, some seeds were imported and succeeded admirably, yet it is only within a few seasons that we have had any for sale; probably the want of regular Seedsmen, and the trouble of importing from France, were among the causes of its slow progress in the United States.]

"Mr. Beadle, a farmer in Kent, has fourteen acres of it, for which he had a premium. When I called upon him in May last, he had mowed his Lucerne, and sold it on the spot for three guineas a load. Those that bought this hay must be well acquainted with its goodness to fetch it from the spot, though they lived ten or twelve miles distant. Horses will work with it green, as well as with lay and corn; they do not sweat with it as they do with other green fodder. It is objected, that it is difficult to make; it is no more so than Clover. All hay is difficult to make in wet weather, but if the weather is bad, put it up in ricks when dry, and between every layer strow a
This difficulty will in future be obviated. Fresh Lucerne seed can always be purchased at the office of the New England Farmer.

little salt, and that will recover all the damage the rain may have done."

Another writer says, "Lucerne should be cut when the stalks are about fifteen or sixteen inches high, on an average; he cut it in three years, sixteen times, or more than five times a year; by the 9th of April, one year, some of the stalks were seventeen inches high, when no field in the neighborhood had grass more than four inches high. The same Lucerne was cut twice before any hay-making began in its neighborhood."

M. Miller, who appears to have cultivated Lucerne with great success, says, that you may cut it in the month of August, the first year, or year of sowing, and feed it afterwards with sheep. It will bear three cuttings and two feedings in a season. Of its capability of resisting cold he gives the following proof:—In the very cold winter of 1798-9, he had some roots of Lucerne dug up and laid upon the surface from October to March, when he planted them, and they shot out vigorously soon after; wet however will destroy the roots. Mr. Miller says, that the most profitable mode of consuming Lucerne, is to cut and give it as green fodder. This is the celebrated Philip Miller, author of the Gardener's Diet: the most respectable authority that could be quoted. Mr. Chateaurieux of Switzerland, by planting Lucerne in rows obtained at the rate of seven tons and two-thirds of hay from an acre, in five crops in one season. Switzerland is a cold country. Mr. Chateaurieux found, that when the thermometer fell to zero the Lucerne did not suffer. Mr. John Wynn Baker, of Ireland, appears to have been very successful in the culture of Lucerne. He says, that in order to ascertain how far Lucerne may be worth the farmer's attention, he made an experiment with a horse, to see how much Lucerne he would eat, so as to learn how many horses an acre of Lucerne would support. The horse he chose was a large one, and had been ploughing all day without food, and he eat forty-nine pounds of Lucerne in the course of the night. Lucerne he says at four cuttings will yield 35840 pounds to an acre. [weighed green, no doubt.] This is a low calculation; an acre therefore will maintain at the rate of 49 pounds per day to each, 5 horses for 20 weeks. No natural pasture can do anything like this: add to this, the profit of making dung all summer.

Mr. Duhamel, the famous naturalist, gives his testimony also in favor of Lucerne; he had forty tons of Lucerne (green) upon an English acre, which he computes at ten tons of hay. By this remark it would seem that he cut it while in blossom, for Lucerne if cut before it flowers, loses 80 per cent, and therefore his 40 tons would only have produced eight of cured hay. We could much extend these extracts, but we have said enough to induce those, who are convinced as we are by experiment, that it is suited to our climate, to try it extensively.

Hemp.—The superiority of Russian over American hemp, is attributed to the process of rotting; the former being rotted by water, and the latter by dew. A lot of hemp, rotted in running water, in Ohio, has been considered by the rope makers in New York, equal in all respects to the Russian. Flax is uniformly, we believe, rotted in this country by water, and we see no reason why hemp could not be with the same facility.

[Prov. Am.]

AMERICAN BAY TREE.

Among the plants which deck the summer of New-England, the tall bells of the Lily are most conspicuous above the countless blossoms of the vallis: The laurel spreads along the hill sides, at one season presenting a wide landscape of gorgeous flowers, and at another exhibiting a rich bed of evergreen foliage. The Rhododendron or American Bay Tree, more magnificent than either, seeks the shelter of the forest and flourishes in the beauty of maturity in some tangled thicket where its buds seemed destined to expand unseen. This splendid shrub clothes the summits of mountains, the shores of lakes or the marshy and damp spots where are the sources of rivers. The banks of the Charles River, and the borders of Sabago Pond in Maine, are the only localities of its growth mentioned by Dr. Bigelow. It is found flourishing in a wood within the town of Leicester.

The leaves are broad, long, and of a deep green color. The flowers expand in large bunches on the ends of the stalks, and are shaded with a tint of pink. The plant assumes the character of a large struggling bush, irregular in shape and having rough bark. The great elegance of its flower and the magnificence of its foliage, recommend it for cultivation as an ornamental shrub, instead of those pampered exotics whose nurture and education consume so much time and care better devoted to develop the beauties and properties of our own native productions. It is said to be difficult to tame, and disposed to dwindle under the hand of cultivation; but probably the experiment of transplanting has not been made under favorable circumstances. Natives of the burning sands of the line and of extreme north, are made to twine their branches sociably together in the parlors of the wealthy. The addition of a splendid ornament to the garden would recompense the care necessary to bring the Rhododendron from his forest bower.—*National Reg.*

BUILDING.

BY DR. MEASE OF PHILADELPHIA.

A very capital error in building in the United States is, the thinness of the walls. A house with thin walls, is both cold in winter, and hot in summer; a house with thick walls just the reverse. To the N. W. and N. E. in particular, the walls ought to be three times the common thickness.

The opportunity here offered, cannot be omitted of bearing a testimony against the common but uneconomical, unhealthy and dangerous practice of erecting wooden buildings, particularly in cities. The evil, however, will correct itself. The frequent fires in Boston; the almost entire destruction of Savannah a few years since, and the dread-ent conflagration of Portsmouth, N. H. speak more forcibly than words, as to the propriety of abolishing the custom of building with wood. It is to be regretted, that in the United States advocates for wooden structures are found. To such the following observations are offered.

By building of wood, much immediate as well as remote inconvenience, is to be expected; and certainly, however suddenly felt may be the comfort arising from an increase of despatch, the numerous considerations of perishableness, want of safety, and call for repairs, added to the reflection, that the public taste is, for the time, deprived of one great field of exertion, will very much weigh with an enlightened people, when once they become awakened to their advantages,

and proud of the singular novelty of their physical and moral opportunities of situation.

Wood, considered as a material of architecture, is not only perishable, but it is fearfully accessible to all the dangers of wind and fire, and is not so strong as brick or stone. To these objections may be added, the consideration, which will weigh with the man of taste, that wood is unsuceptible of chaste ornament. If it be adorned, it is in a finical, puerile taste, in which there is as great a distance from the simplicity of the Grecian, as variance from the whimsical, yet often pleasantly fanciful assemblage of the Gothic style.

Bachelors only ought to build of wood; men who have but a life estate in this world, and who care little for those who come after them. Those who have either children or a wife to leave behind them, will build of brick, if they wish to leave monuments of kindness, rather than a rent-charge, behind them. A well-finished brick house, however small, is not only more elegant, and immediately useful and safe, but it is cheaper in the end than a wooden one. It needs fewer repairs; its prime cost is little more: it is a property which yields more, inasmuch as, if rented out, it carries from the per cent. of rent, fewer of the eating repairs, which render the profits of wooden rentals, so equivocal and precarious. With respect to insurance, which in all populous places sooner or later takes place, it bears an analogy to policies on annuities, where one subject lingers under a precarious existence, and the other is blest and with youth and a sound constitution. In point of ease, taste, and duration, there can be no hesitation between them. The whole doubt in the mind of a builder rests in the competition between immediate convenience and the remote advantage of an unknown duration; for a good brick house will be habitable for centuries.

Considered politically, and in this government every citizen is on the watch of public happiness and political warfare, there is this good attending brick buildings; from durable habitations, in which more money has been spent, and more of the refined tastes gratified, an affection for the soil is increased. A habit of thought arises, favourable to population: a greater proportion of money is thus realised. The great national fund of course is augmented, fixed to the soil and pledged to society.

The last and highest consideration is, that migration would be less easy, and not so common, were a finer spirit of building to prevail. Were the Tartars to build houses instead of wagons and tents, as Baron Tor says they still do, and as they did when the Huns impelled the Goths against the feeble Roman empire, they would not rove, and their country might become a land of tillage.—The facility with which we may move, is a strong incentive to that love of change which it particularly interests us to repress in our citizens.

Prolific.—An Irish lady now resident in Pennsylvania, was a short time since delivered of *five children* at a birth, but who unfortunately did not long survive.—The same lady before she left Ireland had five children at another birth, and twins while she resided in New-York; making twelve children in eighteen months. Had she resided in France under *Napoleon*, he would have pronounced her the 'first woman of the age,' and if we have many such emigrants the next Census of the United States must be wonderfully increased.

RAILWAY FROM BOSTON.

The commissioners appointed to make a reconnaissance and survey of the country between Boston and the Hudson River, with a view of determining upon the practicability and expediency of a Railway, and upon the most eligible route to be adopted for such a work, passed through this town, on Thursday, on their way Westward.— They have thus far made a very careful and thorough examination of the country. They were accompanied, for a few miles to the West, by Governor LINCOLN.

The Survey of the Commissioners is to be extended into the territory of the State of New-York, and we understand that the GOVERNOR, in compliance with the direction of the Legislature, has within a few days, addressed a communication to Governor Clinton, enclosing a copy of the Resolve of the Legislature relating to the Survey announcing to him the appointment of Commissioners, and requesting from him that countenance and favour which may warrant the Commissioners in making, with the State of New-York, the inquiries, surveys, and admeasurements necessary to the execution of their commission. We are informed that Governor Clinton has, in answer, with great cordiality signified his assent to the proposed Survey, so far as the Executive of that State is concerned; and that the success of this important undertaking, from its commencement to its consummation, will be viewed by him with great interest and high gratification.—*For. Yeom.*

Nearly two thirds of the distilleries and brewers in and about Glasgow have given up business for the present, in consequence of the scarcity and dearth of malt, hops, &c. Malt has now become so scarce, that it is with the greatest trouble and inconvenience running about for it that it can be got, and it is as high as 52s. a bolt. Hops that at Martinmas could have been bought for £5 a pocket, now cost £11.

What a contrast?—In the spring of the year 1815 the editor of the Black Rock Gazette paid at the rate of \$5 a cwt. for transporting a printing press, and types from Seneca Falls to Buffalo in wagons, a distance of 116 miles.—Goods, by any considerable quantities, can now be transported from the city of New York to that of Pittsburg, a distance of about 575 miles, for a few cents over \$2 a cwt. including all expenses!

American System.—A meeting of the planters has been called in Natches for the purpose of forming an association for the encouragement of domestic manufactures.

It may be useful to our fair readers to know that muffs, tippets and other articles of fur, which when put into any kind of wood or paper box or drawer, are so generally liable to injury from moths, if put into tin boxes, will remain for years uninjured.

A meeting of the officers of the Revolutionary Army has lately been held in Baltimore, for the purpose of again memorializing Congress on the subject of the half pay which was promised to them in 1780. The Hon. Philip Reed, of Maryland, presided.

A company has been formed in N. York for the purpose of settling sugar plantations in Florida.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, AUGUST 31, 1837.

SOW WINTER RYE.

You cannot sow your winter rye too early in September. If it be sowed early, its roots will get such firm hold of the soil before winter, that it will be the less apt to be laid bare by the heaving of the ground by frost. In the *Memoirs of the New York Board of Agriculture*, vol. i. page 82, it is observed, that rye should be sowed the last week "in August or the first week in September, at the rate of about 20 quarters per acre, some say 18 qts. But if not sowed at that time, it ought to be delayed until late in November, so that it may not come up till Spring. Mr A. Worthington had a good crop, which he sowed in a January snow-storm. Rye raised on upland makes much better flour than that which is raised on low or damp land."

Rye may be sown to great advantage for green fodder for cattle and sheep, particularly the latter, in the spring. When it is meant for this purpose, it should not only be sowed early in autumn, but should be sowed thicker than when it is intended to stand for a crop of seed. Some say that it may well be mowed for hay two or three times in the course of the summer, and this piece of husbandry is recommended for farmers, whose lands are mostly dry and unsuitable for grass.

The quantity of seed to be sown on an acre should vary according to the soil, and the time of sowing, and the purpose for which it is intended. If it be sowed in the latter part of August, or beginning of September, and is intended to stand for a seed-crop, the quantity should vary from 12 to 18 quarters, according to the goodness of the soil. Later sowing requires more seed, and in some cases two bushels to the acre will not be too great a quantity. *Bannister's Husbandry* says "when this grain is sown for sheep-feed, it is proper to allow 3 bushels to the acre, for where the blade, haulm, or stalks form the primary object, a much larger proportion of seed is requisite than when the crop is meant for harvesting."

ON THE CULTURE OF WHEAT AND OTHER CULMIFEROUS PLANTS.

Culmiferous plants have two sorts of roots.—The first originate with the germination of the grain, and are always under the soil, and are called the seminal roots: the second spring from the first joint which is formed above the surface of the soil, and from that joint strike down into the soil: these are called the coronal roots. The coronal roots appear chiefly intended for drawing nourishment from the soil, the richest part of soils being on or near the surface. From these facts some important hints may be derived as to the culture of wheat, rye, &c. The use of stirring the surface in spring to facilitate the entrance of the coronal roots is obvious; the immediate effect of a top dressing is also apparent, and also that manures may be ploughed in too deep to give the full amount of their beneficial effects to grain crops or grasses.

To procure new varieties of wheats, (says Mr London,) the ordinary mode is to select from a field a spike or spikes from the same stalk, which has the qualities sought for; such as larger grains, thinner chaff, stiffer straw, a tendency to earliness or lateness, &c.; and picking out the best

grains from such ear or ears, to sow them in suitable soil in an open airy part of a garden. When the produce is ripe, select the best ears, and from these the best grains, and sow these, and so on till a bushel or more is obtained, which may then be sown in a field apart from any other wheat. In this way, many of the varieties of the common winter wheat have been obtained. Other varieties have assumed their distinctive marks from having been long cultivated on the same soil and climate, and take local names, as the Hertfordshire red, Essex white, &c.

Marshall (Yorkshire) mentions a case in which a man of accurate observation, having, in a piece of wheat perceived a plant of uncommon strength and luxuriance, diffusing its branches on every side, and setting its closely surrounding neighbors at defiance, marked it; and at harvest removed it separately. The produce was 15 ears, yielding 601 grains of a strong bodied, liver coloured wheat, differing in general appearance from every other variety he had seen. The chaff was smooth without awns, [beards or bristles] and of the colour of the grain; the straws stout and reedy.—These 601 grains were planted singly, nine inches asunder, filling about 40 square yards of ground, on a clover stubble, the remainder of the ground being sown with wheat in the ordinary way; by which means extraordinary trouble and destruction by birds were avoided. The produce was two gallons and a half, weighing 26½ lbs. of prime grain for seed, besides some pounds for seconds. One grain produced 35 ears, yielding 1235 grains; so that the second year's produce was sufficient to plant an acre of ground. What deters farmers from improvements of this nature is probably the mischievousness of birds; from which at harvest it is scarcely possible to preserve a small patch of grain, especially in a garden or other ground situated near a habitation; but by carrying on the improvement in a field of grain of the same nature, that inconvenience is got rid of. In this situation, however, the botanist will be apprehensive of danger from the floral farina of the surrounding crop. But from what observations Marshall has made he is of opinion his fears will be groundless. No evil of this kind occurred, though the cultivation of the new variety was carried on among white wheat.

But the most systematic mode of procuring new varieties is by crossing two sorts, as in breeding; that is by impregnating the female organs of the blossoms of one ear with the fecundating matter or pollen of the male organs of the blossom of another variety of a different quality. Thus, supposing a farmer wished to render a very good variety which he was in the habit of cultivating somewhat earlier. Let him procure in the blossoming season, from a very early soil, some spikes of an early sort just coming into blossom, and let him put the ends of these in water and set them in the shade so as to retard their fully blossoming till the plants he has destined to become the females have come into flower. Then let him cut out all the male organs of the latter before they have advanced so far as to impregnate the stigmas; and having done this, let him dust the stigma with the blossoming ears of the early or male parent. The impregnated stalks must then be kept apart from other wheats so as the progeny may be true.—When the grains ripen, sow the best, and from the produce when ripe, select the earliest and finest spikes for seed. Sow them and repeat the

choice till a bushel or two of seed is procured.—This operation has been successfully performed by T. A. Knight, and though it may be reckoned too delicate for farmers in general, it will be looked on by the philosophical agriculturist as not in probability leading to important results, as has attended the practice in the case of garden fruits and flowers.

The manures best calculated for wheat are allowed by all agricultural chemists, to be animal matters and lime. The former has a direct influence in supplying that essential constituent to wheaten flower, gluten; and the latter azote and lime, both actually found in the straw of wheat.—At all events, it is certain wheat will not thrive on any soil that does not contain lime. In this Sir H. Davy, Chaptal, Professor Thier, and Grisebault fully agree.

R. H. Gardiner, Esq. in some observations on the culture of wheat (originally published in the *Hallowell Gazette*, and republished in the *N. E. Farmer*, vol. ii. page 35.) says "all that I have sown on light soil, has looked well in the spring; but what was sown late, that is, after the middle of September, has been invariably struck with rust before it was ripe; while what was sown early has as invariably given a good crop. Most of my experiments have been made on green sward. After having I have selected a piece of ground which required ploughing, and generally of a light loam. I have ploughed it once and harrowed it twice or thrice, putting on between the harrowing, from 15 to 20 loads of manure to the acre, and sowing the seed before the last harrowing. I have always fed it in the autumn, believing it would be less likely during the winter to mould or die, if eaten close, than if left long on the ground. I have found that the lighter the soil the less liable was the wheat to be destroyed by the winter.

"The cultivation of winter wheat is preferable to that of summer wheat on a great variety of accounts. It is sown and the ground prepared at a season of much greater leisure. One of the great disadvantages of our northern climate is the extreme shortness of our spring, so that it is difficult for our farmers to complete the work, which is absolutely necessary to be done, after the frost is out of the ground, and before the season of planting is over. If therefore any work, as the sowing of wheat can be postponed till the autumn it is of great importance. The winter wheat is less liable to injury from insects than the summer; mine has never suffered from them. It affords good fall food, and the larger quantity of roots and stubble to be ploughed in make the land in a better state for the next crop. The grain is heavier, and the same number of pounds will yield a larger quantity of flour, and of a much superior quality. For these reasons, it cannot be too strongly urged upon the attention of our farmers. From my experience I should recommend that winter wheat should not be sowed later than the middle of September, and the soil on which it is sowed should be a light loam, and that about five pecks of seed be sown to the acre. I have also found the use of plaster on wheat advantageous, as also rolling the wheat after it is well up. Winter wheat might probably do better after peas and beans than on green sward."

An able article "on the cultivation of wheat in New England," written by Judge Buel, of Albany, was published in the *New England Farmer*, vol.

v. page 217. Mr Buel is of opinion that the soils of New England, being of primitive formation, are not naturally adapted to the culture of wheat, because they do not contain all the elements of that valuable grain. And that this natural defect can be remedied only by the application of animal manures, or manures containing the elements of animal matter. Animal matter must furnish the gluten which is the principal and most nourishing constituent of wheat. The elements of gluten exist in bones, urine, horn, hair, night soil, in the refuse of the tanner, morocco dresser, tallow chandler, soap-boiler, the offal of the butcher, the dung of fowls, soot, woolen rags, fish, &c. And the proper application of these substances, in sufficient quantities will ensure a crop of wheat."—See New England Farmer, vol. i. pages 103, 132, 178, 379, vol. ii. pages 28, 33, 41, 53, vol. iii. 353, vol. iv. 309, vol. v. 67, 217.

New England Farmer's Almanac, for 1828.

Is press, at the New England Farmer Office, and will be published to-morrow, the New England Farmer's Almanac, for 1828. By Thomas G. Fessenden, Editor of the New England Farmer.

TO THE PUBLIC.

Although, in general, we dislike prefaces, especially to short and ephemeral productions, yet, in the present case, some apology may be deemed necessary for adding another almanac to the great number which annually issue from New England presses. We were induced to this proceeding by circumstances to which we shall briefly advert. As Editor and Proprietor of the New England Farmer, a paper devoted to Agriculture and Rural Economy, which has an extensive and increasing circulation, we have sources of intelligence, relative to improvements in agriculture and the useful arts, as well as means of distributing it, which the public good, as well as a regard to our own interest would seem to require that we should avail ourselves.

Knowledge of that kind, which ministers to the necessities, comforts, and conveniences of life, may, in the form of a small, cheap, annual publication, visit the fire sides and domiciles of many individuals, who cannot afford the money nor the time necessary to purchase and peruse the papers and volumes, composing the channels by which opulent intellect derives its mental treasures.

Should this year's NEW ENGLAND FARMER'S ALMANAC meet with the encouragement which our hopes lead us to anticipate, and present appearances promise, we shall issue it annually, as long as life, health, and circumstances favourable to its publication are granted by indulgent Providence.

THOMAS G. FESSENDEN. JOHN B. RUSSELL.

This Almanac, in addition to the usual miscellaneous matter contained in similar works, will contain a Calendar of the Courts for each state in New England; the Sun's declination; and 10 pages of agricultural matter on the following subjects:

On Soaking Seed Corn in copperas water—on Small Farms—on Clearing—on Fish used as a Manure—on Grapes or Pigs in Poultry—Agricultural Axioms—on Fallen Fruit—on Stopping in swine—How to raise Calves, which shall not be club-footed by Dr. Green of Mansfield, Ms.—How to Fatten Poultry—A cheap method of preventing the disagreeable smell of Privies—Root Steamer, with a drawing—on Grafted Trees—on Painting walls to Mature Fruit—on Cattle stalls—Signs of a good Farmer—on Drying Peaches—on the value of Time—Machines for gathering Clover Heads, with two illustrative engravings—Sir Ashey Cooper's Childain Ointment—on the cultivation of Turnips on a large scale, with a drawing of a machine for the purpose, &c.—Miscellaneous.

This Almanac may be purchased, wholesale and retail at the following places. Of Bowles & Dearborn Booksellers and Stationers, No. 72 Washington Street Boston—O. D. Cooke & Son, Hartford, Con.—Holbrook & Fessenden, Brattleborough, Vt.—Isaac Hill, Concord, N. H.—John Prentiss, Keene, N. H.—J. W. Foster and Childs & Sparhawk, Portsmouth, N. H.—Pearson, Little & Robinson, Portland, Me.—Whipple & Law-

rence, and J. M. Ives, Salem—Ebenzer Stebbins, Newburyport—Hilliard & Brown, Cambridge—E. & G. Merriam, West Brookfield—Clarendon Harris, Worcester—George Dana, Providence—G. Thorburn & Son, No 67 Liberty Street, New York—and by booksellers and traders generally.

THE THAMES TUNNEL.

Yesterday (July 17) Mr Brunel made another report to the Directors on the steps taken for the cleansing of the Tunnel. It appears by it, that the entire upper row of apartments in the shield have been cleared of the mud, and the leakage through them is at present so inconsiderable, that a few men at the hand pump are able to keep it clear. The water in the extremity of the shaft next the shield has been reduced to four feet, and persons could walk into the Tunnel this day, to the length of 70 feet without wetting their shoes. It is expected that the work will be resumed by the end of next week. The instalments on the stock are paid with an alacrity that demonstrates the utmost confidence of the Stockholders of the ultimate success of the undertaking.—Lond. pap.

American Canvass.—The Phenix Mill Company have reduced their prices so as to furnish their canvass at the cost of Russian duck. The excellence of this canvass, which has been extensively used by the government, the Packet Lines of New York, and the New Bedford whale ships, is well established. Capt. Austin, late of the ship Panther, of Boston, states that in a situation where the American and Russian canvass had been exposed to mildew, the former wore one quarter longer than the latter, and he has no doubt of its superiority in every respect. This article is for sale in any quantity; by Mr Joseph Howard, of this town.—Essex Register.

Bite of a Snake.—A Mr Schuyler of this city had a number of men employed at mowing in his meadow, who met with a large black snake and killed it. When the workmen came home from the meadow they told Mr Schuyler that they had killed a snake of a very unusual size. Mr Schuyler enquired where they had left it, and proposed going to find it and bring it home. When he found the place which his informers had pointed out, he saw a snake and picking up a handful of hay stooped down to take hold of it near its head. The snake instantly seized the finger of Mr Schuyler, coiled itself around his arm, throwing its extremity into his face and around his neck, biting very severely. Mr S. made several unsuccessful attempts to shake the serpent from his hold; at length he put his hand upon the ground and bruised the head of the snake with the heel of his boot. In this effort he made the animal relinquish his fangs, and succeeded in killing it.—Mr S. was much affected by the wound, and for several days its effect was doubtful, if not dangerous. Nearly a fortnight has elapsed since the accident, and Mr S. has not yet wholly recovered from it. It appeared that the snake which attacked Mr S. with such ferocity was not the one which the workmen had seen, but was probably its mate. It was of the common species of black-snake, and nearly five feet in length.—Troy Budget.

100 Saxony Rams were sold at Brighton on Friday last, and brought nearly \$3000—average price \$27. One sold for \$64.

The aggregate number of stamps sold in 1826 in London was 26,984,552

Cambridge Wit.—A gentleman of Cambridge College having a clubbed foot, which occasioned him to wear a shoe upon it of a particular make, and with a high heel, one of the college wits called him *Bildad the shuhite*.

For sale at the New England Farmer Office. No. 52 North Market Street.

Lacerne or French Clover seed—Red or Dutch Clover—White Honyuckle Clover, and other Grasses.—White Onion Seed.

With every variety of GARDEN SEEDS.

Horse Rake.

For sale at the Agricultural Warehouse, One of Fire's patent revolving Horse Rakes One of Willis's patent Side Hill Ploughs, an excellent implement.

Medical Lectures—Boston. TIME CHANGED.

Medical Lectures of Harvard College will begin the THIRD WEDNESDAY IN OCTOBER, at the Medical College, Massor street, Boston. The time having been changed from the THIRD WEDNESDAY IN NOVEMBER, when they formerly began. WALTER CHANNING, M.D. Dean of the Medical Faculty.

A WISH.

Mine be a cot beside the hill,
A bee hive's hum shall soothe my ear;
A willow brook that turns a mill,
With many a fall shall linger near.

The swallow oft beneath my thatch
Shall twitter from her clay-built nest,
Oft shall the pilgrim lit the latch,
And share my meal, a welcome guest.

Around my ivied porch shall spring,
Each fragrant flower that drinks the dew
And May's her wheel shall shal sing,
In russet gown and apron blue.

The village church among the trees,
Where first our marriage vows were given,
With merry peals shall swell the breeze,
And point with taper spire to heaven.

EPITAPH IN A COUNTRY CHURCH YARD.

Reader, pass on, nor waste your time
On bad biography and bitter rhyme;
For what I am this cumbersome clay insures,
And what I was is no affair of yours.

THE GAME OF LOSING TIME.

In skimming over Mrs Piozzi's anecdotes of Dr Johnson, the following article struck me forcibly: She informs us, that before she had exchanged her well known British name of Thrale for that imported from Italy, which she now enjoys, she, with two other ladies, and Dr Johnson, formed a party at whist, and amused themselves in play for a considerable portion of the evening. At the conclusion, Mrs Piozzi asked the Doctor if he had lost any thing?—"Only my time, madam," replied the uncouth moralist.

Rude and indecent as this answer may be thought especially when addressed to fashionable women, who had shewn great condescension in admitting Caliban among them, it conveys a most excellent lesson, if properly attended to. On this principle, every man who games must be a loser, and, what is more to be lamented, his loss must be irreparable.

I fear I should be an unwelcome correspondent of, on the subject of gaming, I should speak too much in the style of a philosopher. It would be a difficult task to persuade your readers that time is infinitely more valuable than gold: I have frequently heard players complain of the loss of the latter, but hardly ever the former. They have not always in their recollection, what Dr Young has said upon this important subject.

Time destroyed
Is suicide, where more than blood is spilt.

Dr Young's observations are very pretty, and in my present state of mind, very proper to be attended to. Be it known to ye, gentlemen, that I lost a thousand guineas in the course of yesterday evening; which has almost turned my brain, induced me to commence moralizer, and to congratulate myself on having done it in a few hours; since time is so highly estimated by the learned of all ages.

But, with all proper deference to their superior judgment, I had rather say, with Dr Johnson, that I have "only lost my time," than acknowledge to you, (as the fact is) that I have only lost a thousand guineas.

Forgive my raving, gentlemen, for "I fear I am not in my perfect mind." Whilst I am penning this incoherent epistle to you, I doubt not but I am still playing the losing game: Having lost my money, I am now staking my time, which must infallibly be lost, if you refuse a place in your very excellent miscellany for these eccentric reveries.

But though time is so tremendously and highly spoken of by divines, poets, &c. it is treated with less reverence by the generality of mankind: the sporting gentleman bets upon it, and enjoys it: the musician keeps it and beats it; the saunterer kills it; and the bookseller makes money by disposing of an annual map of a small portion of it. Many ladies lose time; and they would be extremely happy if they could also lose the effects of it, for it behaves unmercifully rude to youth and beauty.

Sporting Magazine.

Pomp is so much the seducing notion of a Neapolitan, that if he cannot hire a boy to walk after his wife to church, he will put on his sword and follow her himself, to give her an air of grandeur. An Englishman would rob on the high way, or sell himself for a slave, with as much good will as follow his wife to church in that manner.—*Angelou's Letters.*

Do young gentlemen study Geography?—A day or two since, while a canal boat was passing by this village, on the deck of which several gentlemen were speaking about the beautiful situation of Waterloo, on the Canada shore, opposite this place, a spruce young gentleman, who wore a cane, and sported a white beaver, begged to be informed "where the battle of Waterloo was fought." All stared at such consummate ignorance. "Gentlemen, where's the spot," he again inquired—none answered. Confused, he cast his eye afloat, and discovered the ebony lue of the cook's bright countenance; the cook naturally thought that the question should be solved, so as soon as he caught the eye of the spark, he exclaimed emphatically "Urop, massa," covering his ivory with a skimmer, as he ran below. The deck roared with laughter. The "mortified man" rushed into the cabin, and betook him to his books.—*Black Rock Gazette.*

A good chance for authors.—In the New-York papers, a young man advertises that, having his evenings to himself, he would write up a gentleman's book for a small compensation.

My kingdom for a horse.—A gentleman in Ohio gives notice that he will exchange a terrestrial and celestial globe for a horse.

An expensive Person. It was said of a person who never dined at home, and who was always speaking ill of the people, that he never opened his mouth but at the expense of his neighbour.

The Maryland papers mention that the venerable Charles Carroll was suffering under a disease of the eye, which it is feared would prove fatal to the sight.

Extract from Niles' Weekly Register.

Much fear is expressed of a loss of the British West India trade—and a shutting of the ports of Cuba would throw us into great alarm; because of a restricted demand for our flour—and yet the *New England states* received from New York,

Pennsylvania, Maryland and Virginia, a much greater quantity of flour than we export to all the *West India islands*. Those states import, from their sister states, more than 625,000 barrels a year, besides large quantities of corn—the whole foreign export of flour was only 813,000 barrels in 1825, and 858,000 in 1826. New England is enabled to receive and consume this great quantity because of her manufactures—more than 281,000 barrels were received at the single port of Boston, of which 72,000 were exported, leaving 209,000 for consumption, chiefly from Maryland and Virginia, in the last year; and the latter, of itself, is almost equal to the whole export of the United States to the British West Indies and Cuba—which, in 1825 was no more than 233,000 barrels.

How small, then, is the foreign demand, compared with the home market, for the growers of grain. If we allow to the people of the United States a quantity of bread stuffs equal only to a peck of corn per week, for each individual, the whole consumption will be about 150,000,000 bushels a year, equal to 30,000,000 barrels of flour, while the export is less than 1,000,000 barrels. The horses and hogs in the United States annually consume more than five times as much grain as would be equivalent to the quantity of flour exported! The foreign demand, however, even for so small a proportion of our bread stuffs produced, is exceedingly important, because of its effect to establish a selling value for all the rest.

It is very probable that the starch used in our manufacturing establishments consumes a greater value of the products of agriculture than the amount of all such articles exported, (cotton and tobacco excepted), to Great Britain and Ireland, Russia, Prussia, Holland, &c. We are not joking. We see it stated that five factories near Springfield, Mass. annually use 40,000 pounds of starch. It is ascertained that at one factory in Massachusetts, employing 200 hands, 200 barrels of flour were consumed last year.

HOP MARKET.

The reports from the plantations are as bad as ever, though there are some few that notice a trifling improvement. In this state of things little is doing. On Saturday there was an advance of 2s to 3s. The Maidstone report says, the rains having washed off part of the vermin and filth, the hop vines have rather a fresher appearance; but as the lice have been increasing generally, the blight is more confirmed. If the present wet weather continues, little doubt can be entertained of the ultimate fall of the crops. The Canterbury report also says, that the vermin are on the increase; and, unless a favourable weather should take place, there cannot be any thing like half a crop.—*London paper, July 2.*

Constantly for sale by E. F. WHITE, No. 11 KIBB street, Boston.

AGRICULTURE.

REMARKS ON THE SCARABÆUS ROSE-US, OR ROSE-BUG.

(Continued from page 42.)

In about 20 days from the time of deposit, generally, the infant larvæ burst from their confinement, and are about one tenth of an inch in length. At this time, they are found lying with the body doubled, nearly in contact. The head is large in proportion to the body, and is covered with a smooth, corneous substance, which soon acquires a faint yellow colour; furnished with mandibles of a light red, especially on the outside. The antennæ are visible. The body is small, white, nearly transparent, composed of 14 segments, and has here and there a few minute light coloured hairs, especially on the posterior part. The legs are six in number, placed near the head, short, clumsy, transparent, and thinly covered with short hair of a faint yellow colour. At this time, they appear to subsist on the nutritious parts of the earth.

About the last of October, the larvæ arrive to their full growth, or nearly so; nearly 6 lines in length and about $\frac{1}{4}$ through the body. They are found, at this time, lying in a curved form, at various depths in the earth. The head is now a faint reddish yellow, and the end of the mandibles are black. The body is white, smallest in the middle, and in the posterior part a dark substance is seen through the skin. There is a striking resemblance between the full grown larvæ of the rose-bug and that of the May-bug, when about one fourth grown—the former has been taken for the youth of the latter.

As the cold weather advances, they descend into the earth, perhaps below the frost, which, if severe, it is probable they could not endure. In this situation they lie torpid through the winter. As warm weather approaches, in the spring, they ascend. On March 21, (weather cold) they were found about 18 inches below the surface of the earth; and on the 6th of April following, (weather warm) they were found near the surface.

About the first of May, they descend to a certain depth in the earth, (not deep however,) and form cells, large enough for them to turn about conveniently. In these cells, they lie in a torpid state, preparing to take the chrysalis form. There may be some little difference as to the time of forming the cells—cold may retard the progress of the larvæ. In this torpid state they continue several days, or until the time of change. This change is preceded by various motions of the insect, now on the confines of the chrysalis state.—The skin of the larva separates from the incipient chrysalis, at the head, and by repeated exertions of the insect is thrown off, and left at the apex of the body. The insect now appears as different from what it was before the change, as if it were a distinct production of nature, or belonged to another order of insects—being an intermediate form between the larvæ and the perfect insect.

The chrysalis is about half an inch in length, the head is bent forwards; the eyes the elytra, and the segments of the body are visible through the skin that encloses them; the legs are enclosed

in separate membranes without the body of the chrysalis; and the whole appearance is of a light yellow colour. In this state they lie dormant until all the parts, as wings, legs, &c. are completely formed and matured. And it is probable, that they are generally prepared by the first of June, to emerge from the earth and become denizens of air; and only wait for a sufficient degree of heat; and then, by some exertion, burst the membranous substance which surrounds them, rush from their cells, dig their passage to the surface, commence a new kind of life, pursue new propensities, and begin their ravages on vegetation.—Those that lie near the surface, probably appear first, as the necessary degree of heat arrives to them sooner, than to those that lie deeper in the earth.

We have now traced our common deprecator through his various gradations, which are all completed, in succession, in the space of one year.

For the general destruction of our enemy, we must look to some powerful operation of nature.

Several species of insects have nearly become extinct, in certain districts, in one season, by the power of frost, or some other cause. Here is our hope; but in the mean time, let us be vigilant and persevering in devising and prosecuting such plans of partial destruction, as circumstances may require. They are so numerous, scattered over our farms and our forests, and possessing the means of spreading themselves in every direction, that our means of defence are extremely limited.

Many supposed antidotes have been tried, but with little effect. Fumes of sulphur will disturb, but not destroy them, neither prevent them from feeding on the leaves, about which the fumes have ascended. Lime water was found ineffectual. A solution of green vitriol was, tried, but the effect was such that it gave me no confidence in it.

Strong tobacco-water applied to the foliage as a wash had only a very limited effect in defending plants. Strong pepper water (pepper seed pulverised, 2 oz. strong tobacco 1 oz. gum arabic 1 oz. boiling water 2 quarts,) applied with a brush, either to young fruit, or to the foliage of plants, had the greatest effect of anything that was tried; but they all come short of the end desired, so far as the writer has proved them.

Millinet spread over plants and well secured is an effectual defence. All my grapes were destroyed the two last years, except those defended in this way. Suppose for instance, that the vines be trained horizontally on a frame, standing east and west, make a tight board fence on the north side of the frame, and from the top suspend the millinet over the frame and on the south side.—The millinet should be bordered with coarse cloth 6 or 8 inches wide, for the better securing it.—The covering may be removed during the night and in rainy weather. This plan has been pursued with a few foreign grape vines for the two years past, and the proprietor has been amply remunerated by the fruit thus preserved from destruction. Small plants are easily defended in this way, by a frame covered with millinet.

The only mode of partial destruction of the insects, which the writer has found advantageous, is the following—Take a large new tin pail, with

one or two quarts of water therein, and with one hand, hold it under the branches of young trees, shrubs, or plants, and with the other hand bend the branch or plant towards the water, and give a sudden shake, or gently grasping the branch and leaves, and with a vicinular motion of the hand and fingers, rub them off—in either case the bugs fall into the water, and the moment they are wet, or strike the water, they cannot fly, neither can they escape by crawling up the tin. When in this manner 2 or 3 quarts are collected, pour on them boiling water, and they have done.* By this process, their numbers may be greatly lessened, and a garden saved from their ravages. In my gardens, which are small, about 3 pecks (after scalded) were destroyed in 1825, one peck of which, by measure, was taken on the 10th 11th and 12th of June. In 1826, about 5 pecks were destroyed in the same way. Two pecks, by measure, were caught in a garden of only 1½ square rods, four quarts of which were taken on the 8th of June, by one person.

Almost all species of insects are made subservient to another class of animals; but no creature is known to the writer to prey on this species of scarabæus; unless it be a species of the dragon fly, so called, which insect appears equal to the task, and may destroy several in a day, grasping the culprit with his legs, and bearing off the victim beneath his body, like a well balanced log under a draught. Should these friends of man greatly increase, they may in time, relieve us, in some small degree, of a "destruction that wasteth at noon day."

POSTSCRIPT.

It was the intention of the writer to have made the foregoing communication at an earlier date, but circumstances, which he could not control, prevented. It may be proper, in this place, to notice the progress of the insects the present season. A few appeared on the 8th day of June, and gradually increased from day to day, until the 24th, soon after which, there was a gradual decrease, in my gardens, until the 18th of July, after which none was observed. From the best information, there were not more than one half as many in this vicinity, as in the last year. In my gardens they were about one-fifth as many as in 1826. The cause of the general decrease was, probably, the severity of the last winter. One great cause of decrease in my gardens was the large numbers destroyed the last season. Although my gardens were this season visited with few rose bugs in comparison with the last; yet, they succeeded in destroying nearly all my grapes, that were not covered, almost all my nectarines, most of my peaches, and mutilated my young plum trees, rose bushes, &c. The same vigilance was pursued this year, as in the last, and only about one peck of the insects was caught.

From several circumstances, which have occurred, it appears that the larvæ in their early infancy are not very hardy; that a certain degree of moisture is favourable to their growth, and that a

* If the insects be immersed in cold water 12 hours, and be come apparently dead, and then be exposed to the sun in a dry place, many, if not all, will resuscitate, and resume their depredations.

superabundant moisture from long continued rains or severe drought, at this early period, might destroy many; the former inauditing them, and the latter by depriving them of necessary moisture.

August 2, 1827.

FRUIT TREES.

Mr FESSENDEN—In the 3d No. of the current volume of the New England Farmer, your correspondent W. D. has proposed a question important to the "cultivators of fruit trees," but which few of them, I apprehend, can experimentally answer.—*whether succors proceeding from the roots of fruit trees, if grafted, make as good and fruitful trees as seedlings?*

In the year 1791 I commenced the cultivation of the little farm I now occupy. The orchard, from negligence and bad management, had become unsightly and unproductive. Most of the trees were converted into fuel. The roots furnished a luxurious supply of succors, from which, as there was no nursery at hand, I bordered my enclosures.—They took root well; grew vigorously; are now healthy and flourishing trees; bearing, bountifully, fair and good sized fruit. Whether *seedlings* would have done better, I cannot determine from comparison, as I have not one of my own rearing, in a bearing state, except stone fruit: my pear trees having been procured in the same manner.

A few weeks since, a celebrated cultivator of fruit, while examining my nursery, inquired whether the trees were seedlings or suckers. On being informed that the pear trees were suckers, he declared that he would not give a cent for the whole of them. After examining my bearing trees, he expressed his conviction that they were, at least, as good as seedlings, as he had rarely seen a better collection. The general objection seems to be, that a sucker will throw off suckers much more abundantly than seedlings. This, I am confident, is not the fact, when care has been taken to sever it from the parent stock, taking only its independent lateral roots. When thus done, it is as perfect in all its qualities as a seedling. Nature renovates the forest, both from seed and suckers, equally well: but in the latter mode much more expeditiously.

Respectfully,

Your friend and serv't,

Worcester, Sept. 5, 1827.

O. FISKE.

PEAR TREES.

{ Linnean Botanic Garden, near
New York, Sept. 1, 1827.

Mr FESSENDEN—Having recently seen numerous publications on the subject of what is termed "disease of the pear tree," I beg leave to refer you for a notice on that subject, to the treatise, page 123, attached to the 23d edition of my Catalogue, published in 1825, where you will find the following remarks:

"This tree [Pear] is however subject to one nearly peculiar to itself, commonly called the *Fire Blight* or *Brulere* which attacks trees in the most flourishing state, generally commencing at the top or extremity of the branches and extending downwards. This is caused by a single stroke of the sun, which extracts the sap from the uppermost branches of the tree, or from such as are most exposed to its influence, with more rapidity than it can be replaced, or from powerful rays of the sun, heating the bark to such a degree, as to arrest or nullify the progress of the sap."

This opinion, then expressed, I do not give as being altogether original with myself, for several

gentlemen with whom I have long been in intercourse, seemed to coincide in this opinion. I have now further to state that I have remarked that it is generally those varieties which are most thrifty in their growth that are most frequently attacked, and even that these branches, which have made the most vigorous shoots on any particular tree are first subject to its effects. These circumstances would seem to add greater strength to the before mentioned theory as to its cause,—as it is the most vigorous shoots which contain the greatest abundance of sap, and which thus present a greater portion of liquid to be operated on by the solar rays.

It has also been noticed that these attacks are by far the most frequent during seasons of excessive rains, which by saturating the earth, cause a superabundance of sap to arise in the tree, and thereby produce an exuberance of growth in the branches. It seems singular, however, that while the trees in so many parts of the country are laboring under these attacks of blight, that in this vicinity we should have so few affected by it, for in five years, numerous as is my collection, I have not had above two trees attacked by it. I must mention one other circumstance, which may aid others in their observations, which is, that the pear called here, Early Green Chisel, and in France the Citron and Carmes or Madelaine, is here more subject to its attacks than any other, which I can only account for from the reasons before deduced, viz. its extremely vigorous growth and superfluous quantity of sap.

In my Treatise of 1825 before referred to, are these further remarks—"It is therefore recommended to plant trees in Pear Orchards much closer than in those of the Apple.—The only remedy against these attacks is to immediately saw off the branches one or two feet below where the blight extends, in which case they generally recover."—I will only add that one of the finest pear trees I have, is one that was many years attacked in this way, and with regard to which I pursued the above mentioned course.

Yours most respectfully,

WM. PRINCE.

VINES.

The Marrow Squash vines, from the seed I bought at the N. E. Farmer office, have been almost destroyed, after having a number of squashes on them, by what is called the borer, a white worm about one inch long with a black head, 16 of which have been taken from the joints of one vine. The egg must have been deposited at the joints, as no hole is perceptible, but a small quantity of borings are seen at every joint, and on cutting the vine lengthwise the insect is found.

Newburyport, Sept. 5. A SUBSCRIBER.

ON MILK.

A work has lately been published in London, entitled "*A Treatise on Milk, as an article of the first necessity to the Health and Comfort of the Community.*" The subject is of great interest, and is ably discussed. The following extracts will prove useful.

"The peculiar fitness of milk for children is universally acknowledged, but its admirable qualifications for the nourishment of a more advanced period of life, seems practically at least, to be doubted, from the disease into which it has gradually fallen. From the nature of milk, it is clear that every part of it contains much nourishment,

and if united with farinaceous vegetables, there is no doubt it will form an aliment sufficiently invigorating, at least, till the age of puberty. Previous to this period, it is hardly necessary to accustom children to any other; and such as are so fed, will be found to enjoy more perfect health and strength than where a proportion of solid animal food is super-added, for the early use of animal food will be found to give an irritability and inflammatory disposition to the system, and goading it on, as it were, to maturity before its time. After the age of puberty, and when an active life has begun, a proportion of animal food, in a cold climate, becomes necessary. This proportion should be continued till the powers of life begin to decline, from which time an eminent writer on diet, Dr Nisbet, has advised, that a return to the aliment of the early days should be again resorted to, in order to correct the alkaliescent state of the fluids which the progress of life naturally brings on. Thus milk may be indulged in at all times of life, unless when certain circumstances or peculiarities in the stomach prevent it.

"It seems to be the opinion of those best acquainted with the nature of the human frame, that the most desirable state in which milk can be adopted as an aliment is, as soon as possible after it is taken from the cow, and before a long exposure to the air has tainted it, or advanced the progress of the spontaneous separation of its component parts. All milk consists more or less of butyrous or creamy, of caseous, [cheese-making,] and of saccharine matter; and the more equally these are blended when milk is taken, the more favourably does it affect the organs of the stomach. When milk cannot conveniently be so taken, (as in towns) it is recommended to heat it to a little below a boiling point, in order as far as possible to reunite the various particles composing it, and which were in course of separation by the forming of cream. It is also advisable in all cases to dilute pure milk, (a beverage known in general only by reputation to the inhabitants of a city,) with a certain portion of water, about one half in bulk for the use of children, and one third for that of adults.

Skim-milk produced from a cow fed with a sufficient quantity of wholesome green food, is an aliment sufficiently nutritious, and perhaps more so (if creamed only ten or twelve hours after setting) than the generality of that liquid, which is sown in large towns as genuine milk. Diluted or skimmed milk, with a little bread, makes admirable breakfasts for growing children and sedentary adults. Skim-milk, with potatoes, and a little bread, will afford a very nourishing diet at all times for those who are not engaged in very laborious exercise.

"In Scotland and the north of Ireland, milk, accompanied with oatmeal, supplies an excellent dish without any bread. It constitutes the breakfast of the young people of all classes, and they are generally much attached to it through life.—The potato is the best substitute we have for bread. It is a light alimentary substance, neither too viscid, nor too flatulent, and having no tendency to acidity.

"The simple accompaniment of skim milk is not supposed, however, to render the potato sufficiently nutritious for robust youth, and still less so for the laborious adult; though it is true that in many parts of Ireland, particularly the south, no better nourishment than potatoes and milk is in general

case; bread is scarcely known to them, and to meat they are altogether strangers; yet these people are commonly distinguished by their personal appearance. It would be absurd, however, to suppose that they do, or can do as hard work as the labourers of England.

"That well known simple preparation, from milk, called whey, is a beverage extremely wholesome and agreeable. Though it is the serous or watery part of the milk, yet, when separated by rancid, and not by its own spontaneous action, it holds a proportion of cream and curd suspended in it, besides a quantity of sugar. It is therefore nutritious, though not so much so as the milk entire and slightly diluted.* It is particularly distinguished by its proportion of sugar, or what has been termed its essential salt. The nourishing quality of sugar is well known and established.

"The adulteration of milk by its vendors in all our towns, (in Great Britain) has long been a subject of very just complaint; nor until the public shall be awakened to the necessity of putting a stop to this evil, is it probable that it will be in any degree diminished; the combination among the dealers rendering it nugatory on the part of the consumer to attempt to relieve himself by removing his custom from one milkman to another."

"The degree in which it is adulterated varies with the conscience of the seller. It would be much less objectionable to satisfy the cupidity of these dealers by a direct augmentation of the price for an unadulterated commodity. The purchaser would thus know what he had, and could increase the bulk by dilution, so as to suit his palate, his purse or his object; this, however, would not answer the purpose of the sellers, who are as anxious to conceal from one another as from the public, the precise sources and amount of their profit.

"In London, the proportion of water sold with the milk, used to be one pint of water to two of milk; but is now generally four pints of water to ten or eleven of milk, and that mixed with liquid which may be said to have been previously diluted in the udder of the cow; for where cows are fed with distiller's wash, grains, raw potatoes, and many other similar substances, which is often the practice through the whole year in London, and in the winter in other large towns, the quantity of milk secreted by the animal is greatly increased at the expense of the quality. This species of feeding is sometimes carried to such an extent that no benefit is derived to the consumer by having the cow brought and milked at his door. Sir Thomas Bernard the late indefatigable and humane treasurer of the Foundling Hospital, and well known to the agricultural world for carrying the Salt Bill successfully through Parliament, pronounced the purest London drawn milk to be on a par only in point of nutrition, with the skim milk of a country dairy."

Carrots require a rich and soft soil; deep ploughing ought to be given to the ground before the seeds are sown; and they ought to be drilled and carefully hoed.

* The late lamented and highly talented Dr Beddoes, author of "Hygeia," and several other interesting works, had so fully satisfied himself respecting the salutary qualities of whey, that he even went to the length of pronouncing it a more invigorating and restorative beverage for the harvest labourer than the best malt liquor.

† It is well known that in London many of the milkmen have different qualities of milk in their two cans, from which they supply their complaining and uncompensating customers.

WORMS IN CHILDREN.

A correspondent has desired us to mention that the apple or knot of the red cedar has proved in many instances, to his knowledge, a thorough remedy for worms in children. We state this with pleasure, as some have expressed doubts of its efficacy.

(Selected for the American Farmer.)

CABBAGES.

Cabbages have always been a rare article with the farmer, and we hope they may be so. Scarcely any plant requires more manure: none will scourge the ground more effectually. Not wishing to encourage the cultivation of cabbages, except in gardens, we dismiss the subject.

Eneyc. art. Agric.

GRAIN.

All sorts of grain ought to be cut, whenever the straw immediately below the ear is so dry that on twisting it, no juice can be expressed; for then the grain cannot improve as the circulation of the juices to the ear is stopped. It matters not that the stalk below is green. Every hour that the grain stands uncut, after passing this stage, is attended with loss.

Sinclair.

USES OF SALT TO CATTLE, WHEN GIVEN SO THAT THEY MAY EAT AS THEY PLEASE.

1. By allowing sheep to lick it, the rot may be effectually prevented.

2. Cattle to whom lumps were given to lick, were thereby preserved from infectious disorders; cows are rendered more healthy, and by being induced to drink more, they give more milk.

3. A small quantity pounded, was found very beneficial to horses, when new oats were given them, if the oats were at all moist; and is useful, with all kinds of moist food.

4. It is said, that the mixing a little common salt with the seed of oats, when sown, is an effectual preventive against the attacks of the grub, so injurious to the crops of oats in some parts of Britain.

Mosselman.

STACKING CORN.

The practice of stacking corn on the ground, in the yard, even though bottomed with loose straw, is exceptionable, part of the grain being apt to imbibe moisture, and the whole being liable to the depredations of vermin. Corn may be stacked in the open air, on corn stands built with brick or stone, or upon pillars made of cast iron or brick, without receiving the least damage. Where cast iron is accessible, that material is to be preferred, as no vermin can get up so slippery a surface.—Seven or nine pillars of cast iron are sufficient for a common sized stack, with a frame of coarse wood, on which the corn is to be laid. The whole amount is often paid by the saving of a year.—The pillars need be but about three feet high.

Sinclair.

THE SECOND CROP OF CLOVER.

It is a good practice to mix a portion of straw, particularly the straw of oats, with the second crop of clover. The straw absorbs the gases and moisture as they exhale from the hay, by which the straw acquires juices, and a flavor which is agreeable to cattle; the hay, which in other circumstances, would be spoiled, is in this manner cured, and the mixture is excellent food for cattle; while the harvesting of the grass or clover crop is accelerated.

Sinclair.

HARTFORD CATTLE SHOW.

The season for the annual Cattle Show and Fair of our Agricultural Society is at hand, and we doubt not the farmers of our county are making suitable preparations for doing justice to the occasion. With others, we have derived much gratification from witnessing the zeal and enterprize which have hitherto so well sustained the interest of these exhibitions; and we have regarded the continuance of such a spirit, after the novelty of the occasion had ceased, as furnishing an honourable comment on the utility of the society, and affording the most cheering evidence that the object contemplated in its institution had to some extent been realized, the attention of agriculturists aroused to the importance of improvements in their department of industry; and a spirit of inquiry, enterprize and laudable competition excited, calculated to elevate the character of the profession as well as augment the wealth and resources of the county. Such, as we fully believe, have been some of the benefits which have resulted from this association; but they have not been produced without exertions on the part of individual members. Further exertions are requisite to insure a continuance of these benefits, and keep alive the spirit already excited. The interests of these exhibitions must be sustained—they must be made extensive and worthy of the county, or the association itself will be of little advantage. We hope therefore the zeal which has been manifested on former anniversaries, will again animate our farmers at the approaching Fair, and that all will cheerfully subject themselves to the little trouble which must necessarily be incurred in the contributing something to the exhibition. Probably there is scarcely an industrious, enterprising farmer in the county, who has not something on his farm worthy to be brought forward on such an occasion;—some animal remarkable for its form, strength, beauty or usefulness—some improved implement of husbandry—some rare production of his fields, or honourable specimen of the industry of his family—let it not be withheld; it will gratify a rational curiosity; it may diffuse important information; not unlikely be attended with personal advantage to the owner, and at any rate will aid in promoting the great object for which the society was established.

It is much to be desired that the exhibition on the third of October next should correspond with the resources of the county—this it cannot be denied has not been the case with former exhibitions though they have been highly creditable. Let every one resolve to contribute something and the thing will be accomplished.—*Hartford Courant.*

Cure for Corns.—A gentleman who may be relied on, informs us he has found the juice obtained by bruising green bean leaves, a certain and effectual cure for corns. It should be applied to the corn at night, for four or five nights in succession. It is equally efficacious when applied to warts.—*Ibid.*

At Cambridge, last week, a graduate of 1756 was present, HENRY HILL, Esq., of Boston, in the 91 year of his age; he has been present at almost every Commencement during the last eighty years.

We learn that over 75 young gentlemen were admitted as Freshmen at the examination of Harvard University on Monday last.

N. Y. HORTICULTURAL SOCIETY.

The New-York Horticultural Society held their anniversary on Tuesday at the National Hotel.—After going into the election of officers, and transacting other business, the members, to the number of about 150, sat down to an elegant dinner, served up in a handsome style. The tables were loaded with the choicest viands, and the most delicious fruits of every kind, furnished from the gardens of members of the Society. The President (Mr Hosack) being absent from the city, John R. Murray, Esq. presided, assisted by Jacob Lorillard and Wm. Neilson, Esqs. Vice Presidents. An address was read, in the course of the evening, by the President, written by M. H. Carter, Esq. which took a very extensive and pleasing view of the advantages, progress, and improvements in this country in agriculture and horticulture. We understand it will be laid before the public in a few days with the awards of the premiums and other documents appertaining to the Society, in a pamphlet form. The following are the gentlemen elected as officers of the Society for the ensuing year:—

For President, David Hosack, M. D.; Vice Presidents, John R. Murray, Jacob Lorillard, William Neilson; Treasurer, John Groshon; Corresponding Secretary, N. H. Carter; Recording Secretary, William Burtzell; Council, Martin Hoffman, Alexander Smith, Charles Oakley, Thos. Pringle, Francis Cooper, Jas. Meinell, Israel Dean, Andrew Parmentier, Andrew Clark, John M'Nab, Peter Aymar, W. Arnold, Samuel L. Mitchell, Thomas Hogg, Edward Probyn, Thomas Kinersley, William Carr, Wm. Wilson, James M'Brair, Nicholas Saltus, William Neale, William Phelan, Michael Floy, John M'Intyre, Peter Hattrick, George Nixon.

GRUB IN SHEEP.

The first expedient which I adopt for a preventive, is to keep my sheep on dry and elevated pasture land in summer, and by all means let them range where they can have access to dust, like that of a dry road. Every farmer has observed that sheep, when flies are about them, will keep a continual stamping with the feet, with their heads near the ground, especially where it is dusty. This dust is inhaled at the nostrils and produces a sneezing, by which the fly or eggs are thrown out. It is a common remark, and experience has demonstrated to every farmer, that low moist land does not answer the purpose for rearing sheep, and the reason is obvious. As a cure for this disease, let every farmer in the fall, before the winter sets in, look to his flock, and he will discover that those sheep which are likely to be affected by the grub, are discharging a water-like substance at the nose; let him take a goose quill, or any other similar tube, or a common hand bellows, and blow dry Scotch snuff or pulverised salt, up the nostrils of the sheep, and it will destroy the grub or eggs and render the sheep sound and healthy.—*Albany Dai. Adv.*

SHEEP.

On Thursday last 930 sheep in one flock passed through this town, on their way to Brighton.—They were driven from the state of New York, about 100 miles west of Albany, where, we are told, they were purchased at less than one dollar a head. They were in good plight, and many of them had fine wool.—*Northampton pa.*

MAMMOTH PLUMS.

We had the pleasure of receiving this morning a present from the ripe and fruitful garden of a good friend, who, we hope, will pardon us for publishing his familiar note.

Newark, Aug. 27, 1827.

GENTLEMEN—I send you herewith, by my friend Mr Carter, a branch from my superior green gage tree, with the fruit (24 in number,) attached. Believing it to be somewhat rare to see so great a weight of fruit of the plum kind, growing in so small a compass, it is presented with a view to gratify you and your friends with a sight of that which will make the mouth water.

Yours with great respect, &c.

LEONARD RICHARDS.

MESSRS CARTER & PRENTISS.

In the transportation, one of the plums was broken from its stem, and we had the curiosity to measure its circumference in the smallest part, which was found to be 5 $\frac{1}{2}$ inches. The tree from which it was taken, bore plums the present year which measured 6 $\frac{1}{2}$ inches and weighed 4 $\frac{1}{2}$ ounces.

The branch which we received, was exhibited this forenoon in the Exchange Reading Room, and will be presented for examination at the Horticultural dinner, this day.—*N. Y. Statesman.*

DRESS OF CHILDREN.

Is there any reason, aside from fashion, why the dress of children should be so contrived as to leave naked the arms, shoulders and upper part of the chest? If there is none in favor of this custom, there are reasons, and serious ones too, against it.

That leaving these parts uncovered is uncomfortable to the individual, any one may be convinced by making the experiment upon himself.—Let him leave his arms, and the upper half of his chest exposed to the variations of temperature during the waking hours of almost any one day; and if on trial, his feelings compel him to restore to those parts their usual covering, let him have compassion enough on the children under his care, to furnish them with a similar protection against the vicissitudes of the weather.

But the objection on the score of comfort, is not the greatest one. This mode of dressing is also detrimental to health. The state of the lungs and other internal organs, greatly depends upon the state of the skin; and is in no way more often disordered, than by any cause which interrupts the due process of insensible perspiration in the latter. In tropical countries, this fashion might be tolerated with impunity; but in ours, and especially in the New England states, where the temperature of the atmosphere sometimes varies fifteen or twenty degrees in the course of a few hours, it is entirely out of place. If such as have arrived at years of discretion, will hazard their lives by conforming to the absurdities of fashion, the worst is their own; but to impose this kind of peunance upon young children, merely to gratify the pride of their parents, is cruel,—is inexorable.—*Con. Journal.*

Wool.—The Poughkeepsie Journal of yesterday (29th) says, "We are pleased to learn that the wool market has considerably improved within the last few weeks. We understand that most of the wool in this (Dutchess) county has changed hands, and that the best lots of merino have brought about 50 cents."—*N. Y. Statesman.*

From the London Mechanics Magazine.

ONE MORE CURE FOR THE AGUE.

Mr Editor,—I herewith send you an agreeable receipt, which I have given with great success.

Best bark half an ounce; salt of wormwood, two drachms; annised water, four ounces.

Mix the whole together, and divide it into three doses, which are to be taken the morning after the fit, at six, seven, and eight o'clock, fasting.—This for an adult. Children according to age and strength.

I have given the sulphur with success, as mentioned in No. 130 of your entertaining work, with this difference; I give it in white wine, and order the patient, when in bed, to drink warm tea as often as agreeable.

The best receipt, certainly, I have ever given, is the quinine pills, which I purchase at the chemists, giving a dose of salts first, and a pill every three hours, when the fit is off. But this medicine is much too high in price for a poor man.

I am, &c. J. N.

From the Novissimum.

M. ERROR.—Being partial to the beauties of vegetation, I cultivate a few shrubs near my dwelling; and they would unquestionably show their vernal beauties to the eye, but for an enemy, whose aggressions are so destructive, and unavoidable, that I am induced to bring them under the notice of the public. This depredator is an insect resembling a wasp, or bee, but rather smaller than either. It fastens on the edge of a leaf, and cuts out, as with a pair of scissors, circular pieces, from the size of a threepence halfpenny to that of a shilling. The process is the work of a moment, and is repeated; until nothing remains of the leaves of the shrub or plant, but a few dangling filaments or shreds. The insects fly away with the pieces thus clipped out in their claws.—Nothing can be imagined more rapidly ruinous to the appearance of the plants, than the continual attacks of these insects; nor more mortifying to the Amateur of the vegetable creation, than to see his choicest foliage thus borne away by piece-meal through the air. I should be glad if any of your Correspondents could direct me to some entomological work describing the insect, its haunts and habits, and still more so, if they could mention any way of evading its attacks.

July 17, 1827.

A FLORIST.

200 SHEEP BURNT.

We have seen a letter from a very respectable mercantile house in Hamburg, dated June 15, which mentions that two hundred sheep, which were to have been sent to this port in the ship Mentor, while on their way to Hamburg from the interior, were all burnt up, the barn in which they "overnight" being struck with lightning. What appears more singular is, that the sum of 23,000 marks banco was insured on these sheep, against the risk of fire, while on their way to Hamburg. These sheep were expected here for sale the present month.—*Boston Daily Adv.*

The wool fair at Berlin, Russia, has not turned out so well this year as was expected. Trade was pretty brisk at Leipsic on the 3d July, and was improving. Great hopes were entertained that the heavy tolls which render German frontiers almost impassable would be abolished

BOOKSELLER'S MARKS.

An acquaintance with the bookseller's marks or signs expressed on the title pages of their books, is of some use; because many books, especially in the century before the last, have no other designation, either of printer, bookseller, or even city. The anchor is the mark of Raphaelengius at Leyden; and the same with a dolphin twisted round it, of the Manuti at Venice and Rome; the Arion denotes a book printed by Oporinus at Basil; the caduceus, or pegasus, by the Weche uses at Paris and Francofort; the cranes, by Cramoisy; the compass, by Plantin at Antwerp; the fountain, by Vascosan at Paris; the sphere in a balance, by Larson or Blaew, at Amsterdam; the lily, by the Juntas at Venice, Florence, Lyons, and Rome; the mulberry-tree, by Morel at Paris; the elv-tree, by the Stephenses at Paris and Geneva, and the Elzevirs at Amsterdam and Leyden; the bird between two serpents, by the Probenuses at Basil; the truth, by the Commaclins at Heidelberg and Paris; the Saturn, by Colinaus; the printing-press, by Badius Ascensius, &c.

CROPS.

William Porter, of Hadley lately harvested 4½ acres of winter wheat, which has yielded at the rate of 20½ bushels per acre, or 120 bushels in all. The stalks were about 6 feet high on an average.

Linus and Dorus Graves, of Hadley, had 40 acres of rye in one field, which was so stout and thick that the reaping of one fourth of an acre was considered a day's work. It is estimated that the average produce will be about 35 bushels to the acre.

The broom corn in Hadley, Hatfield, &c. is not so promising as in past seasons—*Hamp. Gaz.*

Rashness.—A few days since, we are informed, two young men of Troy, entered a meadow in the vicinity of that place, took a couple of scythes from where persons had just been at work and commenced mowing in competition with each other. The young man in the rear, gaining upon his competitor, told him to hasten or he would be in danger of his scythe; and still advancing, incautiously inflicted a dangerous wound upon his companion a short distance above the ancle joint. He fell and lay inanimate for some time. Medical aid was immediately procured, and the wound was dressed; but owing to the deepness of the cut, and mortification having subsequently taken place it became necessary to amputate the leg above the knee. Hopes are now entertained of his recovery. The name of the sufferer our informant believes to be — Decker, about seventeen years of age, apprentice to Mr Nathan Howard, tin manufacturer of Troy.—*Albany Argus.*

New Mexico Road.—The Missouri Intelligencer of July 20, says, Mr Sibley, one of the United States commissioners for making out the road from this state to New Mexico, arrived at Fort Osage on the 8th inst. having completed the road without any interruption or accident, except the occurrence of a stroke of lightning, which fell on his camp on the 6th inst. on his return, and damaged his compass so as to oblige him to leave unfinished an unimportant part of a survey he was then making.

A late English price current notices the arrival of a vessel from Palermo which brought, among other articles, two bales of *human hair*.

Great Increase.—In a piece of clover, belonging to Silas Hale, of Longmeadow, there sprang this season, from three kernels of rye accidentally scattered there, from one kernel, 91 stalks; from another, 90; from another 76. After being somewhat pillaged by birds, the one of 76 stalks was carefully shelled and counted, and amounted to 1931 kernels; making an aggregate of 6310.

Peaches.—In our market good peaches are selling at 18 cents the half peck; while a Philadelphia paper of yesterday says, that fruit of this kind, of a "large size and exquisite flavour," brought, on Saturday only 25 cents a bushel.

New York paper.

Measures are about to be adopted by the citizens of Pittsburgh to establish a company for the purpose of lighting the city with gas. The cheapness and excellence of the coal at that place render the success of the undertaking certain.—*Times.*

Gradual reform.—When Lord Muskerry sailed to Newfoundland, George Rooke went with him a volunteer; George was greatly addicted to lying; and my lord being very sensible of it, and very familiar with George, said to him one day, "I wonder you will not leave off this abominable custom of lying, George." "I can't help it," said the other. "Pugh!" says my lord, "it may be done by degrees; suppose you were to begin with uttering one truth a day."

NEW ENGLAND FARMER.

BOSTON, FRIDAY, SEPT. 7, 1827.

REMEDY FOR TICKS AND OTHER VERMIN WHICH INFEST SHEEP, NEAT CATTLE AND OTHER ANIMALS.

The following is prescribed in an English publication for the above mentioned purposes. Apply an ointment made of an equal quantity of brimstone, gun-powder and common grease.

RECIPE FOR MAKING SOAP.

After having well covered the bottom of the leach with sticks and straw, put first a bushel of ashes, then two quarts of lime, upon which pour boiling water to slack the lime; continue to fill the leach in this manner. For each barrel of soap, take twenty-eight pounds of *clean* grease, and three pounds of resin; melt them together with two pails full of the ley first drawn from the leach. When it has boiled half an hour pour it into the barrel and fill it up with lie as fast as it can be drawn, stirring well as the ley is added. If a sufficient number of leach tubs are used, four barrels can be made with ease in half a day—and if the ashes are good, with entire success.

ANOTHER.

To 12 gallons of ley, strength just sufficient to bear an egg, add 16 pounds of melted grease, which by being placed in the hot sun, and occasionally stirred, will in a few days produce a soap of the first quality.

HOEING TURNIPS.

A second hoeing should be given to turnips when the leaves are grown to the height of eight or nine inches, in order to destroy weeds, loosen the earth, and finally to regulate the plants; a third, if found necessary may be given at any subsequent period. Loudon in giving directions for

the culture of hood crops, says "earth up potatoes but by no means turnips, as that operation only prevents them from attaining a full size."

TO MAKE STARCH.

To make starch from wheat, the grain is steeped in cold water till it becomes soft and yields a milky juice by pressure; it is then put in sacks of linen, and pressed in a vat filled with water; as long as any milky juice exudes, the pressure is continued; the fluid gradually becomes clear, and a white powder subsides which is starch.

HARVESTING BEANS.

Beans are often suffered to remain too long in the field for the purpose of ripening. They become bleached and their palatable and nutritious quantities extracted by the sun, air, dews and rains if not gathered as soon as the greater part of the pods have obtained their full size, and the seeds are fully formed. They should be pulled while the vines are still green, and placed in such a situation on fences, the borders of the field on which they grew, or in a field adjoining, that they may dry without becoming heated or mouldy. If on threshing beans some should be found not fully dried, they should be spread on a clean floor till fit for the bin.

GATHERING OR BRACKS.

Brakes will afford much food for swine, if thrown into their pens, and what the animals do not consume will be very useful for manure. Mr Lawrence, an English writer, says, "All the fern upon the farm should be annually cut and stacked for use, and if an addition can be made from the wastes within a reasonable distance, it is an object not to be neglected, since farmers do not usually complain of having too large a bulk of manure to bestow on their land. I cart from three miles, and for cutting pay five shillings a wagon load." "Fern, cut while the sap is in it, and left to rot on the ground, is a very great improver of land; for if burnt, when so cut, its ashes will yield double the quantity of salts than any other vegetables can do. In several places in the north parts of Europe, the inhabitants mow it green, and burning it to ashes, make those ashes up into balls, with a little water, which they dry in the sun, and make use of them to wash their linen with; looking upon it to be nearly as good as soap for that purpose."—*Diet. of Arts.*

TO TAKE OFF SPOTS FROM CLOTH OF ANY COLOUR

Take half a pound of crude honey, the yolk of a new laid egg, and the bulk of a nut of sal ammoniac, mix them together, and put some on the spots. Having left it there a while, wash the place with clean water, and the spot will disappear.

TO TAKE IRON MOULDS FROM LINEN.

Put boiling water into a bowl, and spread the stained parts of your linen over it, so as to be well penetrated with the steam of the water.—Then rub the places with sorrel juice and salt till they are perfectly soaked. Such linen washed afterwards in the lye of wood ashes, will be found to return entirely free from the iron mould spots & had before.

GATHERING AND PRESERVING POTATOES.

The following is extracted from the Transactions of the Society of Arts in London.

The usual mode at present practised for endeav-

voring to preserve potatoes is to leave them after digging, exposed to the sun and air until they are dry. This exposure generally causes them to have a bitter taste; and it may be remarked, that potatoes are never so sweet to the palate, as when cooked immediately after digging. I find that when potatoes are left in large heaps or pits in the ground, that a fermentation takes place which destroys the sweet flavour of the potatoes. In order to prevent that fermentation, and to preserve them from losing the original fine and pleasant flavour, my plan is (and which experience proves to me to have the desired effect) to have them packed in casks as they are digging from the ground, and to have the casks, when the potatoes are piled in them, filled up with sand or earth, taking care that it is done as speedily as possible, and that all vacant spaces in the cask of potatoes are filled up by the earth or sand; the cask thus packed, holds as many potatoes as it would were no earth or sand used, and as the air is totally excluded it cannot act on the potatoes, and consequently no fermentation can take place."

In order to preserve potatoes in sand or soil it is not necessary to pack them in casks or other vessels. They may be mixed with a due quantity of the earth of the field in which they have grown, and put into bins in cellars, or buried in holes dug in the ground.

"Hints for American Husbandmen, with communications to the Pennsylvania Agricultural Society. By order of the Directors."

By the goodness of a highly esteemed friend we have received a work with the above title, which is filled with articles of much interest and value. We shall attempt a brief sketch of some of its contents in our present number; and propose hereafter to give such extracts, abridgements and notices as our limits may permit, and a wish to fill our columns with that kind of information which will prove most useful may suggest.

The work commences with a communication from BART. W. RIDD, (of England) addressed to JOHN HARE POWEL, Esq. "on the ill effects of soiling cattle—the total failure of salt, and the successful application of Bone Dust as manure—the excellence of Mangel Wurtzel and Cabbages, as winter food for live stock—the degeneracy produced by breeding in and in—the advantageous results of Judicious Crossing evinced in the Turf horse and other breeds." The writer observes "You read much in our English publications of the expediency of soiling cattle in the house during the whole year. I do not approve of this practice, for it is surely an unnatural one, as air and exercise, and the selection of their own food must benefit cattle, as other animals are benefited by them. I can say from actual experience of the two systems that cattle *thrive much better* in the fields during the period from the middle of May to the middle of November, than they do when confined to a house. Soiling cattle is very little practised in England. We read in some books, that mangel wurtzel is an unwholesome food for cattle, but I agree entirely with you that it is a most valuable and nutritive food." "Our best breeds of horses for the carriage, the road, the chase, &c., our cattle, sheep, pigs, and dogs have all derived their improvement from judicious crossing. All the cases of failure have been owing alone to injudicious crossing. You know that I have had long experience on these subjects, and

have been intimately acquainted with our great improvers of cattle, sheep and horses.

"Many of our writers on agricultural subjects, such as Sir John Sinclair, Mr Curwen, and many others, have strongly recommended salt as a valuable manure. I have tried the experiment myself, and have seen it tried by others on various soils and in various quantities; but I could never perceive the least benefit. As a condiment for cattle and sheep, it is very beneficial by promoting digestion when used in moderate quantities.

"I do not observe in the 'Memoirs' any mention of cabbages as a winter food for neat cattle and sheep.—Perhaps your climate is not favourable to their growth. Here the *large Scotch or drum-headed cabbage* is a most valuable winter food, as it produces a greater weight per acre than turnips. It is peculiarly valuable in some districts, for it will flourish on strong soils which are not proper for turnips. You are so perfectly well informed of the state of British agriculture that I do not know whether I can give you any new information, unless it be as to the recent use of bones as a manure for turnips, and the use in the north of England of the improved plough, made wholly of iron, without any wood whatever. The bones are first ground to powder in a mill constructed for that purpose, and in a powdered state are sown by the drill along with the turnip seed. Very luxuriant crops of turnips are thus grown without any other manure. Bones have become an article of commerce, and large quantities are imported from various parts of Europe.

W O R D.

J. Atherstone, in a letter to John Hare Powel, says, "I cultivated some acres of wood in the state of Ohio, which I cut six times during the season, it produced about 30 cwt. to the acre, for which I received, when brought to market 12½ cents per pound, equal to \$120 per acre.

I have been accustomed to its cultivation in England, where I used it for thirty years, as a manufacturer. The soil of America is quite as well adapted, and the climate of the middle, southern and western states, is better suited to its growth, than that of Great Britain. The colouring matter was much stronger—the plant was more vigorous and rapid in its growth, and its product was larger than that to which I have been accustomed in Great Britain.

It prefers a deep, rich, and light alluvial soil—its tap-root extends a considerable distance below the surface. Fine tilth is necessary, but it may, like Indian corn, be grown upon a sward reversed. I have found it a better practice to sow the seeds in beds, late in the Autumn, or early in the Spring, if the climate be severe in winter. When the plants have tap roots about four inches long, they should be set out, at the distance of 8 to 10 inches in rows—sufficiently wide apart to admit either a horse and cultivator, or a ten inch hoe, as the husbandman shall determine, to keep them free from weeds. When the leaves are about 9 inches long, but always before their colour begins to change in any part, they must be cut as spinach with a knife—placed in baskets, and carried into a barn, where they must be chopped forthwith, by means of a chaff cutter, or similar instrument, into pieces of about a quarter of an inch.

So soon as they have been thus prepared, they must be bruised by a roller or bark mill, before

they shall have suffered from heating, which a very few hours would cause. The bruised matter must be rolled by the hand into balls of two or three inches diameter, according to the heat of the weather. Care must be taken to expose it to the free operation of air, whilst protected from moisture. When dry, it may be stored in heaps.

The subsequent crops may be twisted off, without the use of the knife, as the roots at the latter stages of their growth are sufficiently strong to resist the necessary force to remove the leaves.—It may be sown broadcast, but from the extreme lightness of the seeds, great difficulty is found in distributing them equally. In this mode, of consequence, bare patches disfigure the field, and materially affect the amount of its product. The question whether the broadcast or drill system should be employed, must be determined by its relative value of labour and land.

I shall be very glad to communicate with any gentleman on its cultivation, as its importance to manufacturers makes it an object of great interest at this time in America.

One bushel of seeds, if sown in drills, is sufficient for five acres—if sown broadcast, for one acre. It is to be observed, that the wood must undergo the process of *coaching*, before it is fitted for the manufacturer. J. ATHERSTONE.

INDIAN HARVEST.

Top the stalks upon your Indian-corn close to the ears, as soon as the ear becomes too hard to boil; when the weather is fine, bind in small bundles and stack in small stacks, the same day, to secure against rains; your corn will ripen the faster and receive no injury, and your stalks will be more valuable. "If your hay is short, or you wish to sow winter grain after your Indian-corn, or secure your corn against the effects of early frosts, you may cut up your corn-hills close to the ground, in fair weather, with a sharp knife or sickle, and lay two rows into one, in small bundles, as when you top and secure your stalks; bind your bundles above the ears, and stack the same day in small stacks, either upon the borders of your field, or upon an adjoining field; you may then plough and sow as upon fallow grounds; secure your stacks by doubling down the tops, and binding the heads with a pliable stalk; this will exclude the rains, which otherwise would damage your corn. This corn will be ripe at the usual time, without the least diminution in its colour, weight, or value: but in the opinion of some of the best farmers, (who are in the steady practice of this mode from choice,) with an increased value to the grain. The increased quantity and value of your stalks, will richly pay the expense: you may in this way, bring forward the sowing of your winter grain, 2, 3 or 4 weeks, which will again at harvest repay the expense of clearing your corn-fields. If you house your corn-stacks before you husk your corn, the pitching will be heavy, and your bundles often break, and your places for housing, be difficult and inconvenient, and often exposed to your cattle; therefore, husk your corn on the field, and empty your baskets into your cart as you husk, always remembering to leave the husk upon the stalk, by breaking off the cob; these will again repay your expense in feeding. The difference in the mode of husking, will at first be considerable; but a little practice will soon remove this, and render them equal. It is of high importance for every farmer to know every mode of culture, that will afford him successful advan-

tage in managing his farm, and in this point of view, this does not rank as one of the least."

STONES.

Where arable lands particularly abound with these, no good culture can be carried on. The first step then is to clear such lands of the stones, and let this be done effectually; carrying off the small ones and digging out the large ones, so that there be no obstructions to the plough.

Some lands may indeed be too stony to be cleared of them to any present advantage. Let such be left to the prowess of future generations; they will undoubtedly find their account in clearing such, and find use for the stones. If they be not all wanted for fences, buildings, &c. they may be found useful in making hollow drains, &c.

If stones be very big, so that they will not lie in a wall, perhaps the better way may be to throw them aside, and make hedge-fences; but if they be chiefly well shaped, let them be made into walls; for these, if properly made, will last an age, with some trifling repairs. The best method of making these is to dig a trench, where the walls to be made, to the depth of about eighteen inches; into this throw all the small and bad-shaped stones, until the trench is filled; then on the top of these build the wall, in a mason-like manner, to the height of about five feet, and throw the earth dug out of the trench up against the wall on each side; and in this way it will stand for a length of time beyond the memory of Man.—If a trench be not dug in this manner, the next best method is to plough deep trenches close on each side of the wall, after it is built, and throw the earth, thus ploughed up, against the wall.

Where stones are very large, and cannot be removed without breaking them, the best way is to split them to pieces. For this purpose, drill two holes in opposite sides, according to the grain of the stone; then fill each hole with two half cylindrical pieces of iron, and between these drive a long steel wedge. In this way large stones or rocks may be split into proper shapes for good building-stones, or for other purposes. Building fires on large stones will also render them liable to be broken to pieces, while they are thus heated.

By experimenter's accurately made, it is found that small stones on the surface of the ground are beneficial, in a small degree in increasing its products; but they are too troublesome, in good cultivation, to be desirable on account of all the benefit to be derived from them.

Where ground is full of small stones, they may be drove down so as to be out of the way of the silt, by having a roller passed over the ground in the Spring, when it is very soft, as the stones are then easily pressed into it.—*Farm. Manual.*

It was economy and industry that placed the poor printer's boy, FRANKLIN, at the table of kings; and rendered his name illustrious throughout the earth as the *Friend and Patron of Man-kind!* He who possesses either of them can never be poor; he who possesses them both must inevitably be rich and honored.

Let your economy be abstract and rational; not comparative, when opposed by others' prodigality.

Possessed of an healthful climate, inhabited by a moral and industrious people, abounding in water privileges and the Staple of Woollens, &c. New England, by affording an home employment for her children, might become an universal workshop. Encourage Manufactures. They are the

one thing needful. What other country upon earth possesses at once the necessary material, the favorable climate, the industrious habits, the scientific and mechanical skill, in so eminent a degree?—*Palladium.*

RAIL ROAD.

We are enabled to state, in answer to inquiries which have been made in relation to the proposed Rail Road to the Susquehanna, that the surveys have been completed, and that a Report is now preparing with all due diligence. This document will furnish a full view of this interesting subject, with regard not only to the results of the recent surveys and examinations, but also to the value of the modes of communication proposed to be adopted, and the importance of the trade which will thereby be thrown open to the enterprise of our city.—*Baltimore Paper.*

In digging for the foundation of the new London Bridge, many ancient coins, chiefly Saxon and Roman, have been found. They are silver, gold and brass. Some antique implements have also been dug up, warlike and domestic.

Correction. In the article on Millet in our last paper, a mistake occurs with respect to the quantity of manure used. Instead of 2 5/8 cords to the acre, it should read 5 3/4 cords to an acre. Several farmers in this vicinity have given us verbal accounts of most astonishing crops of Millet this season.

Agricultural Engravings.

Just received at the Farmer office, for sale, a series of Engravings, by French artists, comprising a drawing of the celebrated horse Leopold, the property of J. G. Lamiton, Esq.; the Horse Copenhagen, owned by the Duke of Wellington; the Horse Monitor, owned by George IV. the celebrated race horse, owned by the late Duke of York; the Princess Royal, owned by Sir Thomas Murray; a lithographic engraving of Wye Comet, lately owned by John Hare Fox, Esq.;—Likewise several fancy pictures representing herds of bulls, cows, dogs, &c. The drawings are all large, and engraved in a superior manner; and are worthy a place in any gentleman's study or parlour.

New England Farmer's Almanack, for 1828.

Just published, at the New England Farmer Office, and for sale at the Book Stores generally the *New England Farmer's Almanack*, for 1828. By Thomas G. Fessenden, Editor of the New England Farmer.

TO THE PUBLIC.

Although, in general, we dislike prefaces, especially to short and ephemeral productions, yet, in the present case, some apology may be deemed necessary for adding another almanack to the great number which annually issue from New England presses. We were induced to this proceeding by circumstances in which we shall briefly advert. As Editor and Proprietor of the New England Farmer, a paper devoted to Agriculture and Rural Economy, which has an extensive and increasing circulation, we have sources of intelligence, relative to improvements in agriculture and the useful arts, as well as means of distributing it, which the public good, as well as a regard to our own interest would seem to require that we should avail ourselves.

Knowledge of that kind, which ministers to the necessities, comforts, and conveniences of life, may, in the form of a small, cheap, annual publication, visit the fire sides and domiciles of many individuals, who cannot afford the money nor the time necessary to purchase and peruse the papers and volumes, composing the channels by which potent intellect derives its mental treasures.

Should this year's NEW ENGLAND FARMER'S ALMANACK meet with the encouragement which our hopes lead us to anticipate, and present appearances promise, we shall issue it annually, as long as life, health, and circumstances favourable to its publication are granted by indulgent Providence.

THOMAS G. FESSENDEN,

JOHN B. RUSSELL.

This Almanack, in addition to the usual miscellaneous matter contained in similar works, will contain a Calendar of the Courts for each state in New England; the Sun's declination; and 10 pages of agricultural matter on the following subjects:

On Seaking Seed Corn in copper, water—on Small Farms on Charcoal—Fish used as a Manure—on Gapes or Pip in Poultry—Agricultural Accidents—on Fallen Fruit—on Stagers in swine—How to raise Cabbages, which shall not be club-footed by Dr. Green of Mansfield, Ms.—How to Fatten Fowls—A cheap method of preventing the disagreeable smell of Privies

—Root Steamer, with a drawing—on Graded Trees—on Pointing walls to Mature Fruit—on Cattle stalls—Saws of a good Farmer—on Drying Peaches—on the value of Time—Machines for gathering Clover Heads, with 20 illustrative engravings—Sir Astley Cooper's Children Ointment—on the cultivation of Turnips on a large scale, with a drawing of a machine for the purpose, &c.—*See Cellars.*

This Almanack may be purchased, wholesale and retail at the following places. Of Powell & Dearborn Booksellers and Stationers, No. 72 Washington Street Boston—O. D. Cooke & Son, Hartford, Conn.—Hollbrook & Fessenden, Brattleborough Vt.—Isaac Hill, Concord, N. H.—John Proutis, Keene, N. H.—J. W. Foster and Childs & Sprague, Portsmouth, N. Miscellaneous.

From "Absurdities, in Prose and Verse."

THE LOVES OF THE CABRAGE AND THE CAULIFLOWER.

A *Cabbage* lov'd a *Cauliflower!*
 (How far beyond my Muse's power
 To tell how much they loved!)
 "Oh! list unto a lover true,
 To one, whose heart was form'd for you!"
 He said—she seem'd unmoved.

"Ah! think not 'cause my wounds are new
 I speak thus warily, farrest green,
 Nor think me insincere;
 For oh! my love is finely root'd;
 Nor is there one so aptly suit'd,
 To be my wife—my dear."

Said she, "I heard the gard'ner say
 Your heart was hard, the other day,
 Then can you love but me?"
 Said Cab, "You do not comprehend;
 The gard'ner, love, you may depend,
 Did merely wish to cut me."

"Oh then," the *Cauliflower* sigh'd,
 "Do you deem me worthy of your bride
 One of such small renown?"
 "Of small renown? What isn't you say,
 The gard'ner said the other day,
 Your head was worth a crown?"

"Then take me for thy wife, my love,
 With rapture I can never rove!
 No—no—I swear by Venus!"
 "But why so distant?" *Cabbage* cried,
 "So distant?" said the love, by him;
 "We've but one bed between us!"

How high thought the luckless pair
 The cruel gard'ner was so near;
 (He came at set of sun)
 His knife from leathern case he drew
 And cut off both these lovers true,
 For fear that they should run!

ARABIAN MAXIMS.

All secrets which pass beyond two, make themselves known.

Where the heart is inclined, there also will the feet turn.

The little which suffices is better than the much which disturbs us.

The best of man's possessions is a sincere friend.
 The best of riches is contentment; and worst of poverty, low spirits.

Labor for this life as if thou wert to live forever; and for the other, as if thou wert to die to-morrow.

Desire not either the wise man or the fool for thine enemy; but guard thyself equally from the cunning of the wise man, and the ignorance of the fool.

"I would suppose him to be a New Englander."
 (One of Mr. McDuffie's constituents.)

Who is a New Englander? I will answer the question. He is a descendant of the Pilgrims, who preferred death to bondage; who for civil and religious liberty, left the splendid abodes of slavery, braved the dangers of the ocean, and fixed their residence among the savages in the wilderness. These same Pilgrims, under the auspices of Liberty, patiently endured every privation, and triumphed over every danger. They wrested the tomahawk from the hand of its cruel possessor, and turned the wilderness into fruitful fields.

Who is a New Englander? One who has been taught from his infancy the strictest rules of morality and religion; vigilantly to guard his own, equally to respect the rights of others; through his own enterprise and industry he seeks Independence; he cultivates his farm with his own hands, and lives by the sweat of his face; he is free and happy—doubly happy, in the freedom and happiness of all around him.

Who is a New Englander? He is well known in every country and in every climate: he makes the ocean add to the riches of his country; he gathers wealth amid the snows and ice of the Polar regions; for him Arabia yields her spices; his ships navigate every sea, and return richly freighted with the produce of India and of the Isles of the ocean; his enterprize is proverbial from the Arctic to the Antarctic circle.

Who is a New Englander? Ask at home, who has introduced the arts and sciences amongst you? Who has raised and decorated the lofty temples that adorn your city? Who has enriched it, by filling its stores with the produce and manufactures of every country? You may find him in your Schools, Academies and Colleges, he adorns your Pulpit, and gives dignity to your Bar and Bench.

Who is a New Englander? Ask those who have attempted to invade the soil, or abridge his liberty. You may read his name in capitals upon the monuments of Lexington and Bunker's Hill, where he voluntarily shed his blood in the defence of his own and country's rights; where the life of his enemy paid the price of his presumption. Ask Burgoyne, who faced him at Saratoga, and those who engaged him on the Lakes of the North, ask the bravest of the sons of the "fast anchored Isle of the Ocean," who had the honour to meet him in a mortal combat, upon the bosom of the vasty deep? They, without derogating from their own honour, will point you to their scars, extol his bravery and applaud his humanity.

The very name is associated with every thing great and venerable, in industry and enterprize, in Arts and Sciences, in Civil and Religious Liberty. It is a birthright, of which every man who possesses it, may justly be proud, and in any other country but this, "One of Mr. McDuffie's Constituents," instead of considering it a term of reproach, would give no small part of his inheritance to possess it. (*Augusta, (Ga.) pap.*) A FREEMAN.

In the history of English literature there are some glaring instances of plagiarism and impudence, the more surprising because it seems impossible that they could have been practised long with success, or without detection. When Akenside's "Pleasures of the Imagination" first came out in London, without the name of the Author, Roll, a singular character of that day, went over to Dublin, published an edition of it, and put his own name to it. Boswell states that upon the fame of this deception he lived for several months, being entertained at the best tables as the "ingenious Mr. Roll." His conversation, it is added, did not discover much of the fire of the poet; but it was recollected that both Addison and Thomson were equally dull till excited by wine. Akenside having been informed of the imposition, vindicated his right by publishing the poem with its real author's name. Mackenzie's "Man of Feeling" was assumed by Mr. Eccles, a young Irish clergyman—he had been at the pains to transcribe the whole book, with blotches and intermations and corrections, that it might be shown to several people as an original. The effect of this with regard to Mr. Eccles became so general, that the publishers of the work deemed it necessary to contradict the report through the newspapers, and to declare that they purchased the copy right of Mr. Mackenzie. The Rev. Dr. Campbell, of St. Andrews, wrote "An Inquiry in-

to the Original of Moral Virtue," the manuscript of which he sent to Mr. James, a clergyman in England, who was his countryman and acquaintance. James published it with his own name;—and before the imposition was discovered, obtained considerable promotion as a reward of his merit. The celebrated Dr. Hugh Blair, and his cousin Mr. George Bannantine, when students at divinity, wrote "The Resurrection," a poem, copies of which were handed about in manuscript. They were at length much surprised to see a pompous edition of it in folio, dedicated to the princess-dowager of Wales, by a doctor Douglas, as his own. These facts are stated by Boswell.

There is some aptitude in Dr. Clarke's observation—I have lived to know, that the great secret of human happiness is this: never suffer your energies to stagnate. The old adage of too many irons in the fire, conveys an abominable lie. You cannot have too many; poker, tongs, and all—keep them all going."

Arnott, in his recent "Tour to the South of France," says—

"It is almost worth while to go to Perpignan to see their national dances. I shall never forget when, as if by the touch of a magician, all the females were at a particular part of the tune seated on the shoulders of the men, and then put down again on terra firma, the evolutions in the dance being uninterrupted."

Domestic Life.—No man ever prospered in the world without the consent and co-operation of his wife. If she unites in mutual endeavours or rewards his labor with an endearing smile, with what spirit and perseverance does he apply to his vocation; with what confidence does he resort either to his merchandise or farm; fly over land, sail upon the seas; meet difficulty and encounter danger, if he knows he is not spending his strength in vain, but that his labor will be rewarded by the sweets of home! How delightful is it to have a friend to cheer, and a companion to soothe the solitary hours of grief and pain; solitude and disappointment enter into the history of every man's life and he is but half provided for his voyage who finds but an associate for happy hours, while for his months of darkness and distress, no sympathizing partner is prepared.

Savony Sheep.

On THURSDAY Oct. 8. at 10 o'clock,
 The day succeeding the Agricultural Fair,
 At Brighton, (near Boston) the entire flock of *Electoral Savony*
 Sheep, imported in the ship Mentor, Capt. Mann,
 from Hamburg, consisting of
 104 *EBES* and 21 *RAMS*.

The Sheep were carefully selected by experienced agents for account of a highly respectable House in Leipzig, and will be found to excel any flock hitherto imported in regard to size and weight of fleece, &c. they are not inferior in any other particular. The large proportion of *Ewes*, of the finest quality, were not procured without much difficulty; and, in general, such measures were taken as to warrant the expectation that this flock will not suffer by the most rigid scrutiny of persons disposed to improve their flock by the introduction of pure *Savony Blood*.

The Sheep may be examined at Brighton, at any time before the sale.
 Catalogues will be ready for delivery at our office 20 days previous when Samples of the Wool will be exhibited.
 The Agent places himself first one of the Stock will be disposed of until the day of Auction, when they will all be sold without reserve.
 COLLEDGE, POOR & HEAD.

THE FARMER is published every Friday, at \$3.00 per annum, or \$2.50 if paid in advance.
 Gentlemen who procure fire responsible subscribers, are entitled to a sixth volume gratis.

AGRICULTURE.

[Extracts from Hays's American Husbandman, published by the Pennsylvania Agricultural Society.]

On substitutes for Hay—Indian corn sown broadcast on Fallow—its farinaceous product, and value as long fodder.

BY JOHN HARE POWELL, ESQ.

Powelson, Feb. 1, 1827.

The drought of the last Spring so much diminished the crops of hay, that various substitutes were suggested for long fodder. A field was ploughed early in June—part was manured with ashes—part with rotten horse dung—part with bones broken and strewed, at the rate of 250 bushels per acre—the ashes at the rate of 200—the horse dung in quantities equal to 350 bushels per acre.

Upon one acre of the field, three bushels of Indian corn, and a bushel of millet seeds, were sown together—the land was heavily harrowed and rolled. As the millet seeds were bad, and the Indian corn had been a long time thrashed, twice the quantity was sown, which it was supposed would vegetate. The millet seeds principally failed—Not more than a third of the corn appeared above the ground.

Upon adjoining portions of the field, ruta бага, yellow Scotch, and flat red top turnip seeds were sown with Bennett's trough, at the rate of five pounds per acre.

The turnip seeds were lightly harrowed and rolled—the portions of the field so occupied, were in a state of high cultivation as a garden. When the leaves were about an inch and an half long, all the turnips were harrowed with a light seed barrow. For some time they appeared feeble, but they revived in forty-eight hours, and grew more luxuriantly than I had hoped.

I caused a line to be stretched along the field, by which a man was enabled to scuffle rapidly, a space equal to twelve inches, as he advanced in a straight direction. The line was removed until rows 6 inches wide were made in succession, throughout the field, leaving the plants as if they had been regularly drilled, thus diminishing the expense of hoeing, which by American labourers, is little understood.

It will be obviously remarked, they might have been drilled by a regular machine. I had so often been disappointed in growing turnips in drills, from the failure of the plants, that I was determined to secure the crop if practicable at the expense of the larger quantity of seed. The plants were subsequently thinned.

The ruta бага yielded at the rate of about 400 bushels per acre—neither the yellow Scotch turnips nor white turnips were worth gathering.—The Indian corn, although intended to be taken whilst green for long fodder, was allowed to become mature, as it promised to produce much grain. It was cut close to the ground, and bound in the usual mode in small stacks. It yielded thirty bushels of corn—a very large quantity of long fodder, which was estimated at the time, and has since, by the number of cattle which it has supported, been considered equal to two and an

half tons of hay. No labour was applied to the Indian corn after it was rolled, until it was gathered.

These experiments with Indian corn, Swedish turnips, yellow Scotch and white turnips, have confirmed the opinions I have held, that turnips are not profitable in an Indian corn country, except with particular objects—more especially, as in this climate mangel wurtzel supply, at much less cost, the purposes which they are intended to meet.

I have the honor to be, &c.

JOHN HARE POWELL.

To the President of the Penn. Agric. Society.

On substitutes for Hay—Indian corn sown broadcast on Rye stubble and sward—its product and value.

BY JOHN HARE POWELL, ESQ.

Powelson, Feb. 1, 1827.

After a rye crop had been taken, the richest part of the field was ploughed—yellow Scotch and white turnip seeds were sown with Bennett's trough, and were managed as before.

One acre of the same field was at the same time ploughed—four bushels of Indian corn were sown and ploughed under, with a very shallow furrow—an adjoining acre, which had not been previously ploughed, was sown with the same quantity of the same corn, which was in the same manner ploughed under with the stubble—it was all harrowed and rolled. The land had been limed five years since, and was in fine tilth. The turnips failed entirely—the corn vegetated regularly—covered the ground thickly, and put out tassels when five feet high. It was mown when in full blossom—treated exactly as hay; but from the succulence of the stalks, it required much more time and attention, before it could be housed.

I found my cattle to-day contending for it eagerly, when portions of it were thrown before them in the midst of the most fragrant clover hay. The quantity was estimated at two tons per acre.

Upon another field, which, after having been fifteen years in common, was manured with oyster shell lime at the rate of an hundred bushels per acre, I caused six bushels of corn to be sown immediately after the sward and lime had been reversed. The land was harrowed closely, and heavily rolled—the crop was mown and managed as that of the last field—its product was estimated at two tons and an half per acre.

In another part of the same field, manure taken fresh from the stable, was spread upon sward which had been limed as in the first instance. About three bushels of Indian corn were sown on the dung, and were ploughed under with the sward, which was after harrowed and rolled. Fewer seeds were used, as it was supposed the manure would cause most of them to vegetate vigorously.

This piece of land, although much shaded by a close row of trees on its southern boundary, produced more abundantly than the last. It was cut and managed as before. I am inclined to believe from the results of all these experiments, that four bushels of corn in that state of soundness, in which it is usually found after having been thrashed some months, is the proper quantity, or that

three bushels from selected ears, would be sufficient. It must be observed, that the latter part of the season was unusually favorable to the growth of Indian corn.

I have the honor to be, &c.

JOHN HARE POWELL.

To the President of the Penn. Agric. Soc.

On Substitutes for Hay—Millet, its value as long fodder—its injurious effects when cut late.

BY JOHN HARE POWELL, ESQ.

Powelson, Feb. 1, 1827.

Notwithstanding the success in the experiment with Indian corn, I should prefer millet as a substitute for hay, and I should have last year employed it, if I could have procured seeds of good quality. I have obtained, in various seasons, three tons of millet per acre—and in one, much more than that quantity, so far as it could be estimated by weighing one load, and keeping an accurate account of the rest of equal size.

I cultivated thirty acres of millet in 1823, and I should cultivate an equal quantity again, to supply the deficiencies occasioned by the failure of the young grass, of the preceding year.

I am not disposed to consider it a substitute for Indian corn as a farinaceous crop, for obvious reasons, which I have explained at length. Mr Dupont, of Delaware, has cultivated it extensively, and continues to entertain the highest opinion of its use. I am not aware of any evil attending its use as fodder, except when it has been allowed to become ripe; some danger is then to be apprehended to neat cattle, from swallowing the grain unbroken, which, adhering closely to the stomach, cannot be ejected for the purpose of rumination—in one instance I have known it to cause death. Similar effects are sometimes produced by feeding cattle upon Indian meal, without mixture with cut hay or straw. The animal having been tied in a stall, and tempted to consume as much as possible—the system is made sluggish by the want of exercise—the stomach loaded with fat, becomes unable to perform its office—the indigestible meal coheres, causes some times apoplexy, and always injury to the beast.

Graziers, feeders, and dairy farmers, have various appellations for the diseases, with which their animals are assailed; and if the nostrums and hard names which cattle doctors have given in English books were to be regarded, the maladies of neat cattle might be considered almost as numerous as those of our own race—whereas in fact they are very few, exhibiting in different stages various symptoms, in most cases to be ascribed to sudden changes of temperature—to bad management—to external injuries and excess, or deficiency in the supply of food. Free circulation of air—due proportions of succulent and dry food—regular exercise, with protection merely from wet, are the best preventives—copious bleeding—large and repeated doses of Glauber salts in molasses and warm water, followed by castor oil and sulphur, are generally the best remedies for disease.

I have the honor to be, &c.

JOHN HARE POWELL.

To the President of the Penn. Agric. Soc.

From the Newburyport Herald.

SILK WORMS.

The following statement taken from an old number of the *Massachusetts Magazine*, was politely handed to us by a gentleman for publication, and we insert it with the greatest pleasure.—We hope it will call the attention of the farmers of this section to a subject which is beginning to excite, in the middle states, a great deal of interest and inquiry. The statement itself appears to be fair and satisfactory, and should induce to a trial of the success with which the raising of silk may be prosecuted.

Expenses and profits of raising Silk Worms.—One hundred trees of two or three years' growth, will feed an amazing number of silk worms, rate them at

Ol. Cs. Ol.

the land they are put in is a mere trifle; they can be planted in hedge rows, and improve the ground in which they grow. Any vegetable or grass will thrive well under them; indeed by keeping the ground loose about their roots they will thrive best, say the room that they take up is worth another dollar,

Ol. Cs. Ol.

The worms thrive best in mere sheds almost. A tight room is not the thing, a hut of any kind of rough and slight shelter is the best. An unfinished garret; the corner of a barn enclosed for the purpose, will answer; but suppose it were necessary to run up a small building for the purpose, you may raise many thousands in one that every farmer may build for himself, and it will not cost him more than

2l. 8s. Ol.

3l. 0s. Ol.

Ten dollars is then the capital required to set up this business. Now let us see what it will take to carry it on; suppose our farmer has a wife and two children; well, about the 10th of June he thinks of hatching his eggs, (they will cost him nothing) and by the middle of August the work is done. In that time his wife, children, and himself, not employed all the day long about the silk worms, may raise at least 160,000 of them. Then the only thing is to reel off this silk; to be sure, it will require time, patience and industry, to reel off 1,900,000 yards of silk which these 160,000 worms have made; but no money is required to do it. The wife and children do it at their leisure, and when it is done they have 54 lb. of raw silk to dispose of at three dollars per lb.; this is 162, 12s. all by the labor of his own family's hands and that only during part of the year; his trees remain, his shed stands, and his land is still his, and not impoverished.

And why will not our farmers plant these mulberry trees and busy themselves in the culture of this silk? it is for the want of thought; but their eyes will soon be opened to their interest. 43l. for a small family to make in one year, from a capital of 3l. only, with industry and attention, is certainly worth thinking about—where is the farmer that can do better with his land, time or money.

CURE FOR INTEMPERANCE.

Extract from "Mr. Tuckerman's third Quarterly Report, addressed to the American Unitarian Association."

"The intemperate love of ardent spirits is indeed an affection of the mind. It therefore may be, and in a few cases has been, overcome by a strong and persevering action of the mind. The resolution to deny the appetite has been maintained, till a healthful state of the stomach has been produced; and thus all desire for the unnatural

stimulus has been extinguished. Few, however, have the mental vigor which is demanded, for success in this course of healing. With nine hundred and ninety nine out of a thousand, the work of their restoration demands the aid of medicine, as well as of moral means. And surely the encouragement to impart this aid is very great, if one out of six, or even ten, may be thus recovered. But if, as I have no doubt is the truth, three out of four may, by persevering effort, be thoroughly cured, let the politician, let the philanthropist, let the christian patronize the work of staying that plague, which is spreading sin, and misery, and death through the land.

"A word or two of the *modus operandi* in these cases. This is very different in different individuals. Some are far otherwise affected by the same medicine, than are others. Nor is the mere strength of the action displayed by the medicine, the best assurance of its success. That the intemperate may be cured, a more healthful state of the stomach is to be produced; and at the same time, a thorough disgust of the liquors with which they have intoxicated themselves. Nor is this all. The disgust which is given, must for a time be kept up by the same means by which it was produced. Several have been strongly affected by a single glass of medicated spirits, and have fancied themselves, and have been thought by others, to have been cured; but have soon returned to their old courses; and others, who have taken half, or two thirds of the portion prescribed, and who for a fortnight or three weeks revolted from the thought of drinking rum, have again drank it. This has done much to bring the work of curing the intemperate into discredit. The medicine which is given to each one should be of a kind, which is suited to produce in him a disgust of ardent spirits; and this disgust should be kept up for 8, or 10, and sometimes perhaps for 12 days.* I have administered a considerable

* There are two objects to be had in view in curing the intemperate of their love of intoxicating spirits. The first is, to restore the organs which have been diseased by these spirits to a healthful state. The second is, to produce a disgust of these spirits, as strong, and as permanent as can be produced. A temporary disgust of intoxicating spirits is easily produced; and that better state of the digestive organs, which will give to the patient a new enjoyment of his food, a new vigor and activity, a new enjoyment of rest after fatigue, and a new happiness in all his employments, and in all his relations. But the patient is not to be considered as a recovered man, merely because he is brought to feel this happiness. There are cases in which these results, have been obtained by taking medicated spirits only for two, or three days. But the good effects, in these cases, have been of short duration. I have indeed good reason to suppose, in all the cases in which those who have taken medicated spirits have not been thoroughly disgusted with them, either that the medicinal agent employed was not so well suited to produce a strong disgust in the patient, as might have been produced by some other medicine; or, which is by far the more common cause of failure, the disgust has not been kept up long enough to secure its permanence.—Here then, the judgment, and I will add, the authority of the physician is wanted. Some of those whom I have attended, after two or three days

number of Chambers' powders. But a preparation has been made by Reed and Howard of this city, a principal ingredient of which, I suspect to be of a character which is more universally disgusting, than are any of the ingredients in Chambers' powders; or, at least, that this is a more prevailing ingredient in Reed and Howard's than in the New York preparation. Their "cure for Intemperance," I therefore decidedly prefer to that of Chambers."

INFLUENCE OF THE MOON.

The following abstract of a paper of Dr. Olbers, the distinguished Astronomer at Bremen, in Germany, who discovered the planet Pallas in 1802, and the planet Vesta in 1807, translated from the "Annales de Chimie et de Physique," is worthy the attention of all, and especially those who wish to be deluded by the absurd predictions of the weather in Almanacs.

The moon enlivens our nights, draws the earth a little from its elliptic orbit, occasions a small oscillation in the earth's axis, produces the tides of the sea, and a similar but less motion in the atmosphere. Besides these demonstrable effects, many have believed from time immemorial, that the moon exercises a considerable influence upon the health of mankind, upon animals, upon vegetation, and upon chemical products. Experience only can throw light upon this subject; and long and well conducted experiments have been made. As to the influence of the moon upon the weather the result deduced from one series of meteorological observations, is always contradicted by another series. We cite, for example, Howard, who, after careful observation, believed he had discovered, that the barometer was usually lowest (that is, the air was more dense) at the time of new moon. Cotte, on the contrary, to whom meteorol-

have begged with all the impertunity with which a starving man would beg for food, to be permitted "to stop, and to take no more." And it is where this permission has too soon been granted, that almost every case of failure has occurred.—The few cases in which medicine has yet been administered for this object are to be considered as *experiments*; and these have demonstrated, that the work of recovering the intemperate by medicine is practicable. Nor are even failures to be considered as exceptions. They prove only, that the work may be more difficult in one, than in another; that a longer term of keeping up disgust is necessary in many cases, than was at first thought to be requisite; and that physicians should have the charge of this great means of doing good, that patients may be kept in subjection, and in endurance, till they may be safely relieved. If it shall be committed to judicious men, I have no doubt whether this work will prosper. But if it be left to the unskilled, and to empirics, it will soon fall into discredit, and come to naught. There are stages, also, in taking a course of medicated spirits, in which the poor broken down system of the confirmed drunkard requires rest, and other medical applications than are given for the cure of his intemperate appetite, which no other than a physician is competent to prescribe. I should not willingly have done what I have in this business, had I not been assisted with the advice, and the occasional visits, of a medical friend, to whom I am much indebted for his services on these occasions.

ogy is so much indebted; and who commenced in order to confirm the remarks of Howard, found, by twenty years' observation, that the barometer was lowest at the time of full moon. Lalande and Lamerke also, have drawn the most opposite results from their observations respecting the influence of the moon in her passage by the plane of the equator. But what is decisive on this subject is, that in the equatorial regions, where the influence of the moon ought to be the greatest, not a trace of it is to be found; but the heat, rain, winds &c. all depend on the distance of the sun from the zenith of the place. Foul weather and fair often prevail in different places at the same time, and consequently under the same phase (appearance) of the moon. M. Rode, for example, collected the remarks made during the time of an eclipse of the sun, Nov. 18, 1816, from which it appears that a great diversity of weather, without any regard to order, prevailed on that day, through a great part of Europe. Professor Brandes compared, with great labor, the variation of the weather over a great part of the earth's surface in the year 1783, and found no relation between it and the phases of the moon. Suppose that the full moon, when rising, dissipates the clouds; but clouds usually disappear in a tranquil evening.—Some who live near the sea coast, believe that the changes of the weather, and the force and direction of the wind and clouds, depend on the tides. We may here observe, that the tides of the ocean and that of the atmosphere do not happen at the same time. The air being easily moved, and hindered by no obstacle, instantly obeys the attractive force of the moon; but high water in the open sea, does not take place till three hours afterwards; and on coasts and in bays, it happens still later. The astronomer Horseley, at Oxford, Eng. could perceive no relation between the weather and the tides, or moon. And Toaldo, from observations made during fifty years at Poleni, in Italy, where the climate is very mild, while he thought that he could distinguish the influence of the moon upon the weather, was convinced that it was extremely small. A series of experiments, for many years, has convinced me, that, in our climate, where the weather is subject to more considerable and numerous variations, the rules of Toaldo are entirely wrong. For example, on the 7th of Dec. 1813, the full moon coincided with the perigee, and two days after the moon had its greatest northern declination: so that, from the principles of Toaldo, the influence of the moon ought to have been the greatest possible; and notwithstanding all this, there was not any sensible change in the weather. I believe, then, that I have demonstrated that the influence of the moon upon the weather is so small, that it is totally lost amid the great variety of other forces and causes which change the state of our atmosphere.

And the influence of the moon is so insensible on the weather, we are entitled very much to suspect its pretended influence, either upon men, animals or plants. In fact, it is all of it due to illusion and prejudice. Observation shows, that the notion that men weigh one or two pounds more at the beginning of the month; and that lobsters, oysters, &c. are fatter when the moon is on the increase, is entirely without foundation. We may place great confidence in the very careful experiments made by the celebrated agriculturalists, Ladquinterie, Nardmann, Reichard, and Hartenfels; and by the naturalists, Buffon, and Reaumur;

who proved distinctly, that the increase or decrease of the moon had no influence either upon the germination of seeds, or upon the rapidity of their growth or upon their quality.

I can positively assert, that I have carefully inquired into the influence of the moon upon the sick during the long time that I have practiced medicine, and that I never perceived any relation between the moon and my patients; and all modern physicians have come to a similar result. It is in respect to the influence of the moon, as in many cases of reverie, we see it only when we believe it.

A gentleman who came passenger in the Doris, from Liberia, gives of it a satisfactory account. The colonists are in good health, and going on prosperously. He describes their mode of living as comfortable, even to luxury, the tables of many who had arrived there penniless, being covered with the greatest abundance, including wine and other luxuries. It will be observed that the Colonization Society proposes to fit out an expedition soon as practicable, and we hope that the number of those who are willing to visit the "land of promise," may be such as to meet their wishes.—*N. Y. Inquirer.*

In 1822, 88,000 tons of American shipping were employed in the Haytian trade. The imports from the U. S. amounted to 6,000,000 dolls. In 1826, the tons of shipping in this trade were reduced to 13,000 and amount of imports to about one million.

It is stated in the Portsmouth Journal that a few bushels of peaches, from Newton, Mass. were readily sold in that market on Friday, at three dollars a bushel.

A Ducking.—A young man, whose credit had been rather better than his conduct proves it should have been, left the town of Mayfield, in this county, on Saturday last, and made for the canal with a view of being drawn out of the reach of his creditors. Unluckily for him there was one among them sharp set enough to discover his track, and who pursued and overtook him at Voorhees' lock. At the first glimpse the runaway recognised his pursuer, and dove into the canal.—He bent his eyes wishfully to the shores but alas! on both, he perceived those whom he was well satisfied were watching an opportunity to nab him. After remaining in the water about half an hour, and being nearly exhausted he landed and gave himself up, in rather a watery condition, and trembling like an aspen leaf. His creditor, who was a merciful man made him turn down a good horn of whiskey to keep the cold from striking to his stomach, and he in return paid the debt and took up his line of march for the Ohio.

Johnstown Herald.

Explosion.—Last evening, a lad employed in a grocery store in this village, while engaged in drawing some rum for a customer, snuffed his candle, throwing the snuff down into some rum that had leaked out. It immediately took fire, communicated with the stream running into the measure, and burst the barrel, making a heavy report, and scattering the burning liquid to the four quarters of the room. The building was threatened with immediate destruction, but was saved by timely exertion. *Query.*—Suppose the case a little different—in place of the barrel put the body of an "incorrigible toper" and imagine

his throat, the fasset; and then suppose that while "quaffing the deep libation," in that moment of drunkard's ecstacy, a candle should be brought in contact with his beloved beverage—what possible difference could there be in its effects?

Lockport paper.

LACE.

A school, for the purpose of instructing young ladies in the working of lace, has been established at Newburyport.

Philadelphia Arcade.—The stores in the Arcade, says the Aurora, were rented at auction, yesterday morning. All on the eastern side of the eastern avenue, and those on the western side of the western avenue, on the basement story, were rented at from 200 to \$400 each. Three in the centre, on the same story, \$400. That under the stairs, fronting on Chesnut-street, \$180 and one up stairs at \$160. The remainder of the stores will be disposed of at private sale. Immediately after the sale, 15 shares of the stock were sold at \$112 a share at auction.

We are pleased to learn that nine Farms have already been entered for the premiums to be awarded at the next Cattle Show and fair of the Hartford Agricultural Society. This we understand is a greater number than has been viewed in any former year.

SPEED. Yesterday the steam packet Independence arrived in this city from New York, one minute before 5 P. M. having made the passage in 11 hours, and stopped at the different landings. This, we believe, is the quickest passage ever made between the two cities. [Albany Argus Sept. 6.]

A mortal sickness prevails in some parts of the county of Oswego, N. Y. particularly among the labourers on the Oswego canal.—Many persons die, and in one instance five died in one building, on the same day.

CUTTING ICE.

At a recent meeting of the London Society of Arts, Lieut. Hood, of the British Navy, received the large silver medal, for an ice saw for clearing a channel for ships navigating through the ice.—This saw should be known in the United States.

The signs of the times are excellent at St. Louis. Health is perfect, business active, labour is demanded and pay ready. About 130 steamboat arrivals, which have taken place during the season, attest the extent of our commerce. Building goes on rapidly, but not to keep pace with the demand for houses. Every tenement is in requisition. On the other hand crops are good, provisions are cheap, excellent and abundant. In a word, signs were never to good it St. Louis, before. [So writes the *Missouri Observer*, and we reprint the article with pleasure. These are the true "signs of the times." Signs which gratify the patriot's pride, and fill with gladness, the heart of the philanthropist.]—*N. Y. Enquirer.*

Northern Lights have been visible several evenings of the past and present month. On Saturday evening they were peculiarly brilliant, the coruscations extending many degrees to the S. of the "solitary star."

From the Columbia, S. C. Telescope.

PUMPING THE HUMAN STOMACH.

Messrs. Editors.—The instrument for pumping poisonous substances from the stomach was used last week, we understand, by the physicians of this town with the most complete success.

It was employed on a gentleman who had swallowed a prodigious dose of muriate of mercury or corrosive sublimate and laudanum, and that too, four hours after the poison had been swallowed, and after he had been in a state of convulsions and total insensibility, for at least two hours. He was in a deep state of insensibility when the tube was introduced into the stomach. A pint and a half of lime water, the antidote to the poison was first injected, and it was pleasing to witness the immediate good effects.—It was suffered to remain a few minutes; and even before it was withdrawn from the stomach the convulsion had ceased, and the patient articulated several words as distinctly as the apparatus in the mouth would permit, and rationally.

The lime water injected was as limpid and as pure as lime water always is; but when it was pumped out it had assumed the orange colour, testing the presence of muriate of mercury. This test, however, was unnecessary, as a quantity of the poison that had not been swallowed, proved the nature of it. We are happy to state that the patient has recovered from the effects of this dose.

We the more readily publish this case because we are rather inclined to believe that this may have been the first instance in which the instrument has been employed in this state. And as we understand that the operation is so easy both to the operator and the patient, we cannot but think it very important that the employment of it should be widely extended. Melancholy instances of poisoning are but too frequent. The actions of poisons are often so speedy, and the discovery of having swallowed them is frequently so late, as totally to exclude all relief by swallowing remedies, in consequence of the insensibility of the patient.—This operation is the only resource left; and it is a consolation to know that it is so very practicable and efficacious. A CITIZEN.

FISH OIL.

A new process for the purification of fish oils has been invented in France, which we have not seen particularly described, but which the French papers assure us, has the following advantages over the methods commonly in use.

It makes the oil perfectly colourless, by chemical separation of the colouring matter, without in any way affecting the quality. This renders the oil more proper for burning, as it leaves no residuum on the wick; and fits it for use in manufacture of wools, the fabrication of soap, the mixing of paints, and the oiling of machinery. Fish oils are now used in England for painting houses, and floor cloths.

The process of purification requires but little time, and may be finished in a day and night, and the substances employed cost only 50 centimes, [or about ten cents,] for 100 pounds of oil. About two per cent of extraneous matter are removed from the oil.—*N. E. Adv.*

J. B. Ladd's Steam Mill, at Alexandria, has been nearly destroyed by fire, with its contents of flour and grain. Loss said to be \$20 or 30,000.—No insurance.

GRAPES.

The North Carolina purple oval grape, known here as the *isabella grape*, is in very luxuriant bearing in many of the gardens of this village.—A friend has handed us five large bunches on a stalk of one foot in length, and not bigger than a pipe stem.

We are sorry to say that the foreign grape vines of Dr Vanderveer of Flatbush, which have in former seasons yielded abundance of the finest fruit, are blasted for the present season. The green fruit burst open and withered, and the leaves (and in some instances the small branches also) changed to a brown colour and dropped off. Whether this may have been owing to the wet season, or to any peculiarity of the climate, is a question of some interest, and we hope the friends of the vine in different and distant parts of the country will interchange their information and experience on the subject.—*Long Island Star.*

AFRICAN COLONY.

The Doris with 95 coloured emigrants arrived at Liberia from Virginia, on the 11th of April, and remained there until the 21st of June. The colony was in a thriving condition, and the emigrants much pleased with their new residence.—They had gone through the fever with the loss of only two young children, and most of them were working on their farms.—*Hamp. Gaz.*

BREAD.

Bread has been very aptly called the *staff of life*. But in order that it may prove a staff substantial and pleasant, and not a "broken reed," it is necessary that it should be good—that is, *light and sweet*.

In order to make good bread, barn or yeast of a good quality, should be combined in due proportion with good flour. This being premised, the grand secret and mystery of having the bread come out of the oven delicious, inviting, nutritive, is the exact point of time of *putting it in*. While in the dough it will naturally run into several sorts of fermentation, the first of which is the *saccharine* or that which produces sugar; the next is the *vinous*, the third, the *acetous*, &c. If the dough be formed into loaves, and thrown into the oven before the first fermentation, the bread will turn out *heavy*, and whoever eats it may lay his account with having the night-mare, and twenty other "ills that flesh is heir to;" if it be kept from the oven till the second fermentation, it will prove to be light enough, but *tasteless*, and no better than the same quantity of chips; if it be delayed until the acetous fermentation, it comes out *sour*, and altogether uneatable. It is, then, during the first, or *sugar* fermentation, that it should be "cast into the oven;" it will then, after well baking, come forth *sweet*, and fit for the tooth and the stomach of a monarch—aye, and even of the "sovereign people."

The reason why bread will be heavy, if put into the oven too soon, is, that it wants the *enlightening* effect of the fixed air which is generated during fermentation. If taken at "the very nick of time," or during the saccharine fermentation, it will have all the requisite lightness, while the sweetness is confined in the loaves and ever ready to greet the taste of the thrice fortunate and happy eater. That it should be without sweetness, when allowed to run into the vinous fermentation, is not at all strange, when it is con-

sidered that the sugar has turned into wine, or rather *spirit*, and the spirit has evaporated during the process of baking. This sort of bread may be easily distinguished without tasting, by its loose, open appearance, the pores or cells being very large—whereas the genuine good bread is marked by finer pores, and a sort of delicate network of an uniform appearance. The reason why bread turns out sour, when allowed to attain the acetous or *vinegar* fermentation, is obvious to every one. This may be called the *hypocritical* bread, not only because it is *sour*, but because it is apt to assume the appearance of all the other kinds,—and a reference to the senses, either of taste or smell, is necessary to inform you as to its real character. [Berkshire American.]

THE THAMES TUNNEL.

By strong precautionary measures the water has almost been completely drawn out, and the workmen were going on with their work. The earth in front of the face of the present opening, has been bored into the distance of 10 or 11 feet, as it appeared somewhat loose, additional *terpentinus* had been sunk in the bed of the river over the stratum of soil. Beyond this, a strong stratum of blue clay was met with, through which quality of soil the workmen had previously been very fortunate in their exertions.

Visitors descend the shaft by means of a spiral staircase, and meet the mouth of the tunnel.—The passage from shore to shore consists of two continuous arched roads, separated by a line of brick work. The western arch forming a communication from south to north, and the eastern from north to south. The archways are each 13 feet 6 inches wide, and 19 feet 3 inches high; the bricks are hard burnt, and laid in Roman cement and sand, which sets very fast.

The method of building the brick work is extremely curious. By means of what is termed "overhanging," several bricklayers are enabled to work above each other at the same time. An inverted arch, 2 feet 3 inches thick, is turned under each archway, and supports the external wall and half the middle wall on the other side.—The external walls are *battered* or slanted inwards, in order more effectually to resist the pressure of the arch. Openings 6 feet wide, arched at the top, are let into the middle wall at a distance of 12 feet from each other, thus forming a communication between the two arches for the accommodation of the passing pedestrian. In each of these openings a brilliant gas light is placed, the gas for which is manufactured on the premises.

The road way descends 3 feet in 100 to the depth of 100 feet from the mouth of the shaft, and it then proceeds on a level until it reaches the same distance from the north shore. It is to be Mackadamised and the sidewalks paved with Yorkshire flag, and a part of this has been laid. It is at present open to public inspection, and an immense concourse assembled on the 27th of July at the works.

Gigantic Sunflower.—The editor of the Westchester (Pa.) Village Record, gives the following description of a Sunflower:—"Directly opposite our office, in the garden of Mr. Titus Bennett, there stands a gigantic Sunflower, the anak of annual plants. The length of the stem is 12 feet and one inch. A leaf measures 21 inches across. The main flower is four feet in circumference—its disk like the rising moon.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, SEPT. 14, 1827.

SELECT SEED CORN.

Mr J. Mercer, a writer for the American Farmer, in a communication republished in the New England Farmer, vol. v. page 187, states that he had much improved "the genuine Pustarora corn by never planting a grain that was not selected in the fields (for four or five years past) from those stalks which produce two or more ears. Joseph Cooper, Esq. of New Jersey, in a letter to a gentleman in Philadelphia, states that "A friend sent me a few grains of a smaller kind of Indian corn the grains of which were not larger than goose shot, which he informed me by a note in which they were inclosed, were originally from Guinea, and produced from eight to ten ears on a stalk.—Those grains I planted, and found the production to answer the description, but the ears small, and few of them ripe before frost. I saved some of the largest and earliest, and planted it between rows of earlier kinds of corn, which produced a mixture to advantage; then I saved seed from the stalks that produced the greatest number of the largest ears, and first ripe, which I planted the ensuing season, and was not a little gratified to find its production preferable both in quantity and quality to that of any corn I had ever planted.—This kind of corn I have continued planting ever since, selecting that designed for seed in the manner I would wish others to try, viz.—When the first ears are ripe enough for seed, gather a sufficient quantity for early corn or replanting; and at the time you would wish your corn to be ripe generally, gather a sufficient quantity for planting the next year, having particular care to take it from stalks that are large at bottom, of a regular taper, not over tall, the ears set low, and containing the greatest number of good sizeable ears of the best quality; let it dry speedily; and from the corn gathered as last described, plant your main crop, and if any hills should be missing, re-plant from that first gathered, which will cause the crop to ripen more regularly than is common, which is a great benefit. The above mentioned I have practised many years, and am satisfied it has increased the quantity, and improved the quality of my crops beyond what any person would imagine, who has not tried the experiments."

MOLASSES FROM SWEET APPLES.

The Rev. Jared Elliot, in his "Essays on Field Husbandry" observed that "A barrel of cider of sweet apples when made into molasses, will be worth three pounds, abating five shillings for the making, when cider made of common apples, will be worth but twenty shillings, exclusive of the barrel."

SAFE AND EASY CURE FOR THE PILES.

To three gills or a pint of new milk when boiling, add a table spoon full of cream of tartar. After separating and rejecting the curd, drink the whey at night when going to bed. This medicine taken a few evenings in succession seldom fails of affording relief.—Communicated for the New England Farmer.

HOW TO PREPARE MOLASSES FOR PRESERVING FRUITS, &c.

Take 8 lbs. molasses, bright New Orleans or Sugar House; 8 lbs. pure water, 1 lb. coarsely

powdered charcoal.—Boil them together for 20 minutes, then strain the mixture through fine flannel, double,—put it again in the kettle with the white of an egg, boil it gently, till it forms a syrup of proper consistence, then strain it again.

REMEDIES FOR CATTLE WHICH ARE CHOKED BY ROOTS OR OTHER SUBSTANCES.

Mr Philip Wingate of Hallowell, Me. in a letter published in the New England Farmer, vol. iii. directs when "a creature is choked with any hard substance, such as turnip, potato, or an ear of corn, to take an old, hard turned rope, 6 feet long. Let it be *serued*, [strongly wound round with twine] and, when finished, be one inch in diameter. When put down the throat, it should be pushed gently down four feet and a half into a cow or an ox. In cold weather it is stiff enough, but in warm weather it should be wet with cold water before it is used."

Mr E. Williams, of Westford, N. Y. in a letter published in the New England Farmer, vol. iii. p. 81, says "a more effectual method of relieving the distressed animal is merely to pour down the throat one quart of very strong soap suds. I have seen it tried in numerous instances, and invariably with the best effect. It affords instantaneous relief."

Mr L. W. B. of Bristol, R. I. (according to a communication published in the New England Farmer, vol. v. page 138.) relieved a cow, which was choking, as follows. "Taking hold of her tongue, I raised her nose so that the under jaw was in a line with her neck, and then directed my companion to take an axe which lay near by on the ground, and pass its handle down her throat, observing to him that the course was a straight one. This he did with a steady motion until he felt the obstruction, and pushed it forward into her paunch or stomach. Upon withdrawing the handle, the cow was at once entirely relieved." The writer, however, says that an axe handle is not to be preferred for operations of that kind. "Were I to choose a fit instrument to perform a like operation, I should prefer a limber ox-whip handle with a smooth butt end, or a very stiff tarred rope, or a smooth common walking cane, or even a hoe handle. With either of the above instruments, ordinary obstructions in the throats of cattle may be removed more easily, and with less pain to the animal, than by jamming or crushing them with a mallet on a block, as is the common practice."

REMEDIES FOR CATTLE WHICH ARE HOVEN, BLOWN OR SWOLLEN.

Cattle are apt to be *hoven*, or *swollen*, or *blown*, as it is sometimes called in consequence of having eaten too much green succulent food, such as turnips, clover, lucerne, &c. The common remedy for this disorder has been to stab the infected animal with a pen knife or other sharp instrument under the short ribs, and to put into the orifice a tube of ivory, elder, a quill, or something of the kind, to give vent to the confined air. The wound is then dressed with some sort of adhesive plaster, and thus, in general, the cure is effected. This, however, is a rough and dangerous remedy, and we therefore, give place to others more safe and gentle.

The 33d volume of the Annals of Agriculture gives the following recipe, and announces it as a specific for hoven cattle, even in the most desperate cases; effecting a cure within the short space

of half an hour: Take three quarters of a pint of olive oil, one pint of melted butter, or hog's lard: give this mixture by means of a horn or bottle and if it does not produce a favorable change in a quarter of an hour, repeat the same quantity and walk the animal gently about. For sheep attacked with this malady the dose is from a wine glass and a half to two glasses.

Besides these remedies, a flexible hollow tube made by winding iron wire round a rod, with drawing the rod and covering the wire with leather, was invented by the celebrated Dr Munro, Professor of Anatomy at Edinburgh. "It consists of iron wire about one sixteenth of an inch in diameter, twisted round a rod three-eighths of an inch in diameter, and made of polished iron in order to give it a cylindrical form: the wire after being taken off the rod should be covered with smooth leather. To the end of the tube, which is intended to pass into the stomach, a brass pipe, two inches long, of the same size, or rather larger than the tube, is to be firmly connected: and to prevent the tube from bending too much within the mouth or gullet, an iron wire, one eighth of an inch in diameter, and of the same length as the tube, is put within it, but afterwards withdrawn, when the tube has entered the stomach. As Dr Munro has ascertained that the distance from the fore teeth to the bottom of the first stomach of a large ox is about six feet, the tube ought, therefore, to be at least two yards long that it may operate effectually on the largest oxen. When the instrument has been introduced into the stomach, it may remain there for any length of time, as it does not obstruct the respiration of the animal; the greater part of the condensed air will be speedily discharged through the tube; and should any ardent spirits, or other liquor calculated to check the fermentation be deemed necessary it may be safely injected through this pipe. In short, the flexible tube here described has been found of infinite service in saving the lives of cattle, and especially of sheep, when subject to similar disorders, or any other swelling peculiar to these creatures."—*Domestic Encyclopedia*.

An instrument for relieving hoven cattle and sheep, was invented by Mr Richard Eger, an Englishman. It is nothing more than a cane with a knob of wood at the end. The length of the cane for oxen should be at least six feet—that for sheep ought to be about three feet. When any beast is blown or hoven, Mr Eger directs a person to lay hold of it by the nostril and one horn, while an assistant steadily holds its tongue with one hand, and pushes the cane down its throat with the other. Care, however, should be taken, not to let the animal get the knob of the cane between his grinders, and also to thrust it down far enough; because its whole length will do no injury. As there will be found an obstacle at the entrance of the paunch, the cane must be pushed with additional force; and as soon as a smell is observed to proceed from that place, and the animal's body sinks, the cure is performed.

The society for the Encouragement of Arts &c in London, voted to Mr Eger a reward of fifty guineas for communicating to the public the above simple yet effectual method of relieving cattle thus dangerously affected. The same implements used in the manner here described will answer the purpose of relieving cattle and sheep when choked with roots.

Another remedy still more simple, and which we are assured is effectual in common cases, if seasonably applied, is as follows. Make about a pint of ley, either with hot embers thrown into a sufficient quantity of water, or by dissolving therein about an ounce of pot-ash, or pearl-ash and turn it down the throat of the ox or cow affected. A proportionably less quantity will answer for a sheep. This is said to give immediate relief by neutralizing the fixed air [carbonic acid gas] in the stomach of the animal, and thus causing the swelling and other dangerous symptoms of the complaint to subside.

ON MILK.

(Continued from page 54.)

"The consumption of milk in London is supposed to be in the ratio of 60 quarts per annum to each inhabitant, or about 70 millions of quarts in the year. This gives one sixth of a quart, on an average, to each individual per day. It is provided, as the first instance, by the London Cow Farmer, who sells to the milk-man the produce of as many cows as will suffice for his custom. The latter undertakes to milk the cows at their stalls in the city, and pays for the daily quantity contracted for at the present rate of one shilling [about 22 cents] the common gallon of overflowing ale measure.—The feeder thus receives just three pence [$\frac{3}{4}$ cts] a quart for the pure milk, (if such it may indeed be called) and the milkman, after diluting it with a large portion of warm water, sells it to his customers at four pence [$\frac{7}{8}$ cents] a quart, inferior measure; from which it follows that the milk-man receives nearly as much for the delivery of the milk from house to house, as the cow farmer does for supplying it. Thus, an individual, with no other capital than £100, which he gives for a "Milk Walk," who may easily deliver 70 quarts in a day, has the means of getting 15 or 16 shillings a day, for the occupation of seven or eight hours, in going twice to the dairy stalls in the suburbs of the city, milking six or seven cows, and delivering their produce to his customers. Where pure milk is required, those small feeders, who both produce and sell, will supply the article for five pence [9 cents] the quart, at their own residence, without the labor of delivery.

"We have stated the milk to be delivered pure by the cow farmer to the milk man; and we believe it is no way adulterated or diluted by mixture of any other matter. But the high price obtained for cream in London by the cow farmer, from confectioners and opulent families, is known to cause a great reduction in the richness of a portion of the milk delivered. It is effected in the following manner. It is well known that of the milk drawn from any cow at one time, that part which comes off first is always thinner than what is afterwards obtained; and the richness continues gradually to increase progressively to the very last drop that can be drawn from the udder. The richest part of the contents of this natural milk vessel having risen to the top, must always be drawn out the last.

"It is a common practice with the cow farmers to retain a sufficient quantity of these "last drops" (which are called "strippings," perhaps a quart in the udder of as many cows as will enable them to meet the demand for cream, and they thus obtain as much cream, at 3s. a quart, from cows fed in the manner which has been mentioned. The other parts of the milk have obviously a much larger

proportion of watery substance in them, than if they had received the benefit of the strippings.—Much of the London milk is therefore first diluted in the udder by watery food; then creamed there by leaving the strippings; and, finally, more or less diluted by the milkman.

"In Mr Curwen's report to the Board of Agriculture, of the measures he pursued for supplying the poor of Workington with milk in 1805 and subsequent years, he states that compared with other species of food, milk is not only the most nutritious, but the cheapest article of subsistence that can be produced for the support of man. He compares its price with that of bread, and with the average cost of butcher's meat. At the time he wrote (1807) bread was selling at three pence per pound; milk therefore at two pence [$\frac{1}{2}$ cts.] per quart, wine measure, (the price he sold at,) or one penny per pound, was exactly one third of the price of bread. Compared with butcher's meat it was one sixth; and as a beverage and substitute for malt liquor, he conceived it to be one fourth; while it was certainly better adapted to the laborer than any other liquor, from its being of a slower digestion. Mr Curwen continued his supply to Workington until he had succeeded in his object of convincing the neighboring farmers, (his tenants) that their individual interests went hand in hand with that of the public; that in delivering raw milk in the town at two pence a quart, their profits were ample; and that whilst those who embarked in the trade should have the good sense to be satisfied with a price which gave milk a preference over all the other necessaries of life, the demand would continue and increase; but if unfortunately for themselves and the public, the dealers should combine, and succeed in advancing the price of milk, the infallible consequence would be, that the demand would as rapidly decrease as it had advanced, and milk would again become an article of luxury.

"Mr Curwen ascertained that at the time he wrote, in 1807, the town of Kendal, in Westmoreland, was the most abundantly supplied with milk of any town in the kingdom. It appeared that the daily sale to a population of 7,500 was equal to a pint for each person (three times the proportion of the London consumption.) The happy effects of milk are strongly exemplified in the remarkable instances of longevity to be met with in Kendal, and not less so in the great disproportion of deaths of children under seven years of age, contrasted with other towns of equal population.

"The last consideration under this head is the necessary result of the principle established by Mr Curwen, that "milk affords the largest supply of victual from the least consumption of food;" in other words, that the same quantity of agricultural produce converted into milk, will afford a larger proportion of human sustenance than in any other shape.

"The experience of Mr Curwen induced him to believe that the food necessary for a cow in full milk did not exceed in price one third of what is necessary in feeding for the butcher; but allowing the difference in the quantity of food to be less than here supposed, a milk cow giving daily during the space of nine months that she is now usually in milk, the quantity of 10 wine quarts, would produce 7,200 quarts, or 5,400 pounds weight of milk.* Were the same animal fattened to 30

*The wine measure is to ale measure as 231 to 360. These

stone per quarter, and supposing five quarters for the carcass and fat, the whole weight would be but 1,200 lbs. and would be to milk, only in the proportion of one to four, although produced at an expense of three to one.

"Mr Curwen further supposes the produce of each acre of wheat to be 24 Winchester bushels at 60 lbs. per bushel. The actual nourishment derived from one bushel will be 37 lbs. of first flour, 14 of two inferior sorts, $\frac{8}{10}$ lbs. of bran, allowing half a pound for waste, making in the whole 1224 lbs. of flour per acre; so that it would require four acres to give the weight of grain equal to the weight of milk afforded by a single cow in nine months; which cow may be supported on considerably less than one acre. The result will be that more land is required for one pound of flour, than for six pounds of milk; while the sustenance to be derived from one pound of flour cannot be considered as equal to two or three pounds of milk."

Death of Mr Canning.—The last London papers announce the afflictive intelligence of the death of the Right Hon. George Canning, Prime Minister of England—a loss deeply deplored not only by the British nation, but by the civilized world. He died on the 8th of August, in the 57th year of his age. His disorder was lambrago, which became inflammatory, and terminated in mortification. A London paper says "Mr Canning's health has been on the decline since the severe cold he took at the funeral of the Duke of York. The intense interest excited by his illness in every place where the tidings have been received, cannot be described.—The news of his death was communicated to Paris in ten hours after it took place." No foreign event has occurred for many years, which appears to have excited greater sensation in the United States. Those who might not approve of all his measures as a politician, cannot but do homage to the splendor of his talents; and the uprightness of his intentions was generally allowed by those who thought themselves in duty bound to place themselves in the ranks of his opponents.—Lord Goderich was appointed by his Majesty's command to form a new Cabinet, and assurances were given that the government would be conducted on the same principles as heretofore.

The N. Y. Statesman has the following remarks: "We have to announce the unexpected and much lamented death of Mr Canning, the *First Minister* of England, and, as we believe, the *First Man* in Europe, and, if not the *first*, one of the greatest statesmen in the world. The mournful aspect of our columns, feeble as the tribute may appear to the memory of the deceased plebeian statesman, who was a republican in heart, would not be assumed for the loss of his Royal Master, or that of all the kings who sit on earthly thrones.

We consider the death of Mr Canning, a loss to the world. Gradually and steadily he was infusing into the monarchical governments of Europe, the liberal sentiments and free principles for which

being the respective numbers of cubic inches in each measure. Milk is most commonly sold by wine measure. The wine pint of milk weighs exactly a pound avoirdupois. The ale pint about 1 lb. 3 oz.

*The stone weight of butcher's meat is only 8 lbs.; of all other dry substances is 14 lbs. avoirdupois. Thus, 12 pounds of 6 quarts of milk are produced at the same expense as 1 pound of beef, and afford considerable mere sustenance, and that of a more beneficial quality.

our revolutionary fathers fought, and triumphantly established. Mr Canning was a bright and brilliant star, to whom all eyes were turned, both in the old and new world, upon both of which the light of his mind, the uprightness of his genius, and the glory of his life, shed their benignant rays."

"We can only say, in the language of a French paper, 'There are some sympathies so powerful that the spirit of rivalry itself, cannot weaken them. We live in times when the loss of a Minister friendly to liberal institutions, is a cause of sorrow to all generous hearts.'"

FALL SOWING OF SEEDS.

It is necessary to observe, that some, and even many, things, which are usually sown in the Spring, would be better sown in the fall; and, especially when we consider how little time there is for doing all things in the spring. Parsnips, carrots, beets, onions, and many other things, may be safely sown in the fall. The seed will not perish, if covered by the earth.

Seed of all plants will lie safe in this way all the winter, though the frost penetrate to the distance of three feet beneath them, except the seeds of such plants as a slight frost will cut down. The seed of kidney beans, for instance, will rot, if the ground be not warm enough to bring it up. So will the seed of cucumbers, melons, and Indian corn, unless buried beyond the reach of the influence of the atmosphere. Even early peas would be best sown in the fall, could you have an insurance against mice. We all know, what a bustle there is to get in early peas. If they were sown in the fall, they would start up the moment the frost was out of the ground, and would be ten days earlier in bearing, in spite of every effort made by the spring-sowers to make their peas overtake them.

Upon a spot, where I saved peas for seed, last year, some that was left, in a lock of haulm, at the harvesting, and that lay upon the dry ground, till the land was ploughed late in November, came up, in the spring, the moment the frost was out of the ground, and they were in bloom full fifteen days earlier than those sown in the same field as early as possible in the spring. Doubtless, they would have borne peas fifteen days sooner; but there were but a very few of them, and those standing straggling about; and I was obliged to plough up the ground where they were growing. In some cases it would be a good way, to cover the sown ground with litter, or with leaves of trees, as soon as the frost has fairly set in; but not before; for, if you do it before, the seed may vegetate, and then may be killed by the frost. One object of this fall-sowing, is, to get the work done ready for spring; for, at that season, you have so many things to do at once! Besides, you cannot sow the instant the frost breaks up; for the ground is wet and clammy, unfit to be dug or touched or trodden upon. So that here are ten days lost. But, the seed, which has lain in the ground all the winter, is ready to start the moment the earth is clear of the winter frost, and it is up by the time you can get other seed into the ground in a good state. Fall sowing of seeds to come up in the spring is not practised in England, though they are always desirous to get their things early. The reason is, the uncertainty of their winter, which passes, sometimes, with hardly any frost at all; and which, at other times, is severe enough to freeze the Thames over. It

is sometimes mild till February, and then severe. Sometimes it begins with severity and ends with mildness. So that, nine times out of ten, their seed would come up and the plants would be destroyed before spring. Besides they have stags that come out in mild weather, and eat small plants up in the winter. Other insects and reptiles do the like. From these obstacles the American gardener is free. His winter sets in; and the earth is safely closed up against vegetation till the spring. I am speaking of the north of Virginia, to be sure; but the gardener to the south will adapt the observations to his climate, as far as they relate to it.—*Cobbett's Am. Gardener.*

A Russian fleet has proceeded to the Archipelago for the purpose of compelling a cessation of hostilities between the Greeks and Turks

Fresh Garden Seeds.

For sale at the office of the New England Farmer, No. 52 North Market Street, Boston, a complete assortment of *Chester and Field Seeds*, many of which are suitable for fall sowing; a part of the seeds are of the growth of 1827; among which are

Superior WHITE PORTUGAL ONION
BLACK SPANISH, or WINTER RADISH
FALL PERKLY SPINACH, for greens
WINTER COLD, for greens
WINTER HOLLAND BERRY
Various sorts of CABBAGES, PARSNIPS, CARROTS, LETTUCE, BEETS, &c. &c.

Grass Seeds.

ORCHARD GRASS, LUCERNE, HERD'S GRASS, RED TOP, RED and WHITE DONEYUCKLE CLOVER, &c

New England Farmer's Almanack, for 1828.

Just published, at the New England Farmer Office, and for sale by BOWLES & DEARBORN, 72 Washington Street, and at the Bookstores generally, the *New England Farmer's Almanack*, for 1828. By Thomas G. Fessenden, Editor of the New England Farmer.

This Almanack, in addition to the usual miscellaneous matter contained in similar works, contains a Calendar of the Calendar for each state in New England; the Sun's declination; and 10 pages of agricultural matter on the following subjects:

On Soaking Seed Corn in copperas water—On Small Farms—On Charcoal—On Fish used as a Manure—On Grapes or Pip in Poultry—Agricultural Accidents—Fallen Fruit—On Stagers in six and eight—How to raise Cabbages, which shall not be cut by frost, by Dr. Green of Mansfield, &c.—How to Fatten Fowls—A cheap method of preventing the disagreeable smell of Privies—Root Steamer, with a drawing—On Grafted Trees—On Painting walls to Mature Fruit—On Cattle stails—Signs of a good Farmer—On Drying Peaches—On the value of Time—Machines for gathering Clover Heads, with the illustration—Sixty Cooper's Childbin Ointment—Recipes for the Ladies, containing directions for making several kinds of Cake.—Miscellaneous, &c.

This Almanack may be purchased, wholesale and retail at the following places. Of Bowles & Dearborn, Wholesale Booksellers and Stationers, No. 72 Washington Street Boston—O. D. Cooke & Son, Hartford, Conn.—Holbrook & Fessenden, Braintree, Conn., Vi. Isaac Hill, Concord, N. H.—John Frontis, Keene, N. H.—J. W. Foster and Childs & Sparhawk, Portsmouth, N. H.—Pearson, Little & Robinson, Portland, Me.—Whipple & Lawrence, and J. M. Pees, Salem—Ebenzer Steedman, Newburyport—Hillard & Brown, Cambridge—E. & H. Merriam, West Brookfield—Jereddon Harris, Worcester—George Dana, Providence—G. Thorburn & Son, No. 67 Liberty Street, New York—and by booksellers and traders generally.

Country Dealers and others supplied on the most favorable terms.

Farnham's Improved Cider Mill.

A mill on this plan of full size is 4 feet by 2 1/2. The cylinder is 16 inches diameter and 9 inches long; the periphery fixed with points of iron or steel, placed in a spiral form, projecting 3-16ths of an inch, placed 2-3ds of one eighth of an inch apart from each other, there being four rows around, said block or cylinder and 43 teeth in a row; the teeth may be 16 brads. The cylinder is put in motion by a whirl and band.

This mill without the power cost from 10 to 12 dollars; and by giving it 500 revolutions per minute it will grind or grate with one horse power sixty bushels of apples per hour; with two horses double the quantity. The apples are graded very fine without breaking the seeds.

There was rising of two thousand barrels of cider made in one of these mills last year, without expending one cent for repairs. Agents will shortly be out in the state of Massachusetts to sell out the rights of towns, counties, &c.

Applications, post paid, directed to JOSEPH E. WHITE, No. 115 Water St. New York, or to JOSEPH R. NEWELL, Boston, will be attended to.

The following are some of the Certificates respecting the Greater Cider Mill.

Beth-shar, May 30, 1827.

I hereby certify that I have one of Joel Farnham's Greater Cider Mills in operation, and when grinding with water power, I have ground two bushels of apples in a minute, but when grinding with horse power, about half that quantity. The quantity of apples is about 7 bushels for a barrel of cider. As to the quality of the cider, I have not discovered any material difference that is made in the hot mill, but there is much less sediment, I think not more than a quart, or at most 2 quarts to a barrel. A. LEONARD.

Queen, Tisbury, Jan. 12, 1827.

We the subscribers, hereby certify that we have made cider at Joel Farnham's cider mill, at his dwelling place, in Tioga town, and with his Greater Cider Mill, and it will do the work complete as the above given by Mr Leonard.

G. L. TALCOTT,
J. M. CHICG,
R. BROWN,
E. TALCOTT, Jr.

This certifies that I have one of Joel Farnham's patent cider mills, and it will grind from one and a half to two bushels of apples in a minute; it will grind a bushel and a half without any urging, but it will grind two bushels, and the cider is perfectly clear and pleasant when well worked, and I think it will make more cider than any of the old fashioned mills.

Sponser, May 21, 1827.

I. WOODFORD.

Yellow Locust Seed,—Turnip Seed, &c. For sale at the New England Farmer office, a few lbs. Yellow Locust Seed.

Miscellaneous.

Poetry.—When Dr Percy first published his collection of *Ancient English ballads*, he was too lavish in commendation of the beautiful simplicity, and poetic merit of some of them. This circumstance provoked Johnson to observe one evening at Miss Reynolds' tea table, that he could rhyme as well in common conversation.—For instance, says he,

As with my hat upon my head
I walked along the Strand;
I there did meet another man
With his hat in his hand.

Or, to render such poetry subservient to my own immediate use,

I therefore pray thee, *Reamy* dear,
That thou wilt give to me,
With cream and sugar softened well
Another dish of tea.
Nor fear that I, my gentle maid,
Shall long detain the cup.
When once upon the bottom I
Have drank the liquor up
Yet hear, alas! this mournful truth,
Nor hear it with a frown,
'Thou canst not make the tea so fast
As I can gulp it down!

And he proceeded through several more stanzas until the Rev'd critic cried out for quarters.

Travelling for Pleasure.—We have read somewhere of an oriental emperor who abandoned his throne and went roaming over the world in pursuit of happiness. After much vain seeking, he discovered that the throne which he had left, for which he had been educated, and where he felt at home, had more pleasure for him than might else which he had tried. We opine that the present style of fashionable travelling forces many a citizen to a similar conclusion—that there is more happiness in attending to business than in a fashionable tour. Let us analyze a pleasure jaunt—its principal ingredients are head-ache, steam-bath, dust and perspiration. You leave the city in the morning, after snatching a "short repast" and in a high fever from attending to a thousand things incidental to a start. You shave in a hurry, and cutting off half your chin and upper lip—no time to look for court-physic. Steam-boat crowded, no room on deck for walking, and the cabin hot as Tartarus. Up the river you go, there is the same eternal scenery which you have viewed a thousand times—no variety—no change—the Palisade rocks as perpendicular as Butter hill as high as ever—the self same anales that you saw last year staring at you from Polyplus Island, are there again. There is that deathless old eagle ascending from his solitary eyrie on Beacon-hill—will nobody shoot that old bird? He has been showing himself off for the last fifteen summers to all steam-boat travellers. Up jumps the same sturgeon that you saw last year, and to give you a nod *en passant*. Every thing is the same, you alone are changed—darker lip and darker brow, and more pen-ive men, "I have become yours, since you last looked on you mountain-as-hand you pine-crested height. But at this rate we shall never reach Albany, though moving 12 miles an hour. Well, at last you are in Albany. The sun has gone down on your first day of pleasure—how do you feel? The jarring of the boat has shattered your nerves, your head snaps as if it were filled with

4th of July crackers, popping off *seriatim*, your steam-bath has boiled your whole body, you are listless, vacant, and wearied from having had nothing to do—you groan out "Periudici!" and go to bed. Thus ends your first day of pleasure.—*N. F. Courier.*

What ratio of sleep does nature require?—Answer—Keep yourself actively employed till you feel fatigued, and then sleep until you feel refreshed, whether it require 4, 6 or 8 hours, or any namable time. For if you retire before nature requires repose, you will dream yourself fatigued! It must be evident, that the time requisite for sleep, is the time required by nature without reference to its length or shortness, or any arbitrary rules.—*Charleston paper.*

Question by an Englishman, to an American arriving at Liverpool from the United States: What are your newspaper writers about?

Answer.—Tearing in pieces the characters of the President, the Secretary of State, and the old General who conquered the Savages of the South West, and rescued New-Orleans from your fatal grasp.

Rejoinder.—Success to their endeavors! We shall not be sorry, to say on your authority, that all your public men are scoundrels and liars.

Every man has a right to choose a name for his children, but we doubt whether a father is justified in giving his son so incalculably absurd an appellation as *James Richard Napoleon Bonaparte Peter Winslow*—the son of a shoemaker in Maine. We recollect a father proposing to name his son, *Thomas Jefferson Madison Robinson Rowlandson Richardson*, to which a friend recommended the addition of *Hox-pen, Board fence and Wood-pile.*

Soda Water.—The lovers of this delightful beverage will not thank Dr. Paris for the following account of its effects. He says, "the moderate custom of drinking it, during or immediately after dinner, has been a pregnant source of dyspepsia."

The Liverpool Chronicle notices the arrival in the ship America, (of Boston) Capt Glover, of two American deer.

As Indian corn, or maize, was not particularly mentioned in any of the British statutes, prohibiting the importation of foreign grain, the article has been lately carried from this country to England. It was reported, a few weeks ago, that an order had issued to suspend the admission of it.—But it is now stated, in a New-York paper, that the report was incorrect, and that Indian corn is admitted.

Answer to a challenge.—An officer of distinction and of tried valor, refused to accept a challenge sent him by a young adventurer; but returned the following answer. "I fear not your sword, but the anger of my God. I dare venture my life in a good cause, but cannot hazard my soul in a bad one. I will charge up to the cannon's mouth for the good of my country, but I want courage to storm hell."

HENS.

Hens will, it is said, be sure to furnish an extraordinary quantity of eggs if you deal to each about a gill of oats per day.

PATENT LAMP AND BOILER.—The Editor of the New England Farmer has invented and obtained Letters Patent for a Lamp Apparatus for heating water, cooking, and other economical purposes." One modification of this invention has been already very useful to Druggists, as will appear by following recommendations.
"Mr. FESSENDEN.—Sir, I have, for the last six months, made use of your quart Lamp Boiler. It is the most convenient, cleanly, expeditious and economical method I have ever made use of for preparing Infusions, Syrups, or Ointments. I have made several experiments and found that in ten minutes it will boil one quart of water. The quantity of alcohol consumed is but 1 oz. for the expense of 1 cent. I consider your apparatus, used I have become accustomed to it, as almost indispensable. It may be, I think, also very useful in a nursery, a sick chamber or for culinary purposes. Your gallon boiler I have also used, and find it to answer equally well, where larger quantities are to be heated.

"Your obedient servant,
"JOSEPH KIDDER, Druggist.

"Boston, Feb. 26, 1827."

"Mr. FESSENDEN.—We the subscribers fully accord with Mr Kidder, in his opinion of the utility, cheapness and despatch attending the use of your Lamp Boiler, for the purposes he has mentioned. Signed, Root & Howard; Ebenezer Wight; Ephraim L. Ebb; W. R. & J. W. White; John J. Proctor; John Thayer; John P. Whitwell; Maynard and Noyes; A. T. Lowe; Daniel Henchman; William Blasland; Samuel L. Brewer and Brothers; Gregg and Hollis; Edward Thorndike; James Powell; and a number of others, including nearly all the Druggists in Boston.

The undersigned has had in use for several weeks, Mr Thomas G. Fessenden's "Lamp Boiler." It is so constructed that little if any of the heat of the lamp can possibly escape, unless it be through the flue in the boiler; and it is alcohol he used in the lamp, the contents of the boiler will rise to the boiling point quicker than in any other apparatus which has as yet come to the observation of the undersigned. The apparatus is neatly constructed, and combines economy and utility. It is of infinite advantage in the formation of syrups, decoctions and infusions; and the principle can be so applied, as to be of great service in the laboratory, as well as in a grocer's shop.
Boston, Sept. 1, 1827. THEODORE DEXTER.

It was observed by Count Rumford, in one of his *Economical Essays*, that, "It is a curious fact, but is nevertheless most certain, that in some cases, spirits of wine is cheaper, when employed as fuel, even than wood." This assertion will apply with more force, when alcohol is burnt in this apparatus, than in any method of consuming it described by Count Rumford, or known at the time he wrote. The boiler is constructed so as to confine a current of hot air and flame to its bottom and sides, against the flue, the fire being driven off at the furnace in miniature. Lamp Boilers of the above description may be obtained at the office of the New-England Farmer, No. 52, North Market street; Joseph Kidder, corner of Hanover and Court street; Ebenezer Wight, Milk street opposite Federal street; Richard A. Newell, Summer street; Druggists; and of William Howe, No. 7, Marshall street, and Deaf, Boyes, Charleston, The Manufacturers, who will have a right under the patent to manufacture said implements.
Sep. 13.

Sawney Sheep.

On THURSDAY Oct. 18, commencing at 10 o'clock, The day succeeding the Agricultural Fair, At Brighton, near Boston, the entire flock of *Electoral Saxony Sheep*, imported in the ship Montic, Capt. Mann, from Hamburg, consisting of
161 EWES and 21 RAMS.

These Sheep were carefully selected by experienced agents for account of a highly respectable House in Leipsic, and will be found to excel any flock hitherto imported in regard to size and weight of fleece which they are not inferior in any other particular. The large proportion of *Ewes*, of the finest quality, were not procured without much difficulty; and, in general, such measures were taken as to warrant the expectation that this flock will not suffer by the most rigid scrutiny of persons disposed to improve their stock by the introduction of *pure Saxony Blood*.

The Sheep may be examined at Brighton, at any time before the sale. Catalogues will be ready for delivery at our office 20 days previous—when Samples of the Wool will be exhibited.

The Agent pledges himself that none of the Stock will be disposed of until the day of Auction, when they will all be sold without reserve.
COOLIDGE, POOR & HEAD.

Medical Lectures.—Boston TIME CHANGED. Medical Lectures of Harvard College will begin the THIRD WEDNESDAY IN OCTOBER, at the Medical College, Mason street, Boston. The time having been changed from the THIRD WEDNESDAY IN NOVEMBER, when they formerly began.
WALTER CHILVING, Dean of the Medical Faculty.
Aug. 31, 1827.

The FARMER is published every Friday, at \$3.00 per annum, or \$2.50 if paid in advance. Gentlemen who procure five responsible subscribers, are entitled to a sixth volume gratis. New subscribers can be furnished with the preceding numbers of the current volume.

AGRICULTURE.

From London's Gardener's Magazine.

History of the First Introduction of the Modern Style of Laying out Grounds in Russia.

TZARSCO CELO was originally brought into notice by the Empress Catharine I., who built a small palace there, and gave it that name, which is derived from Tzar, imperial, and Celo, a spot; Imperial Spot or Hamlet. At 12 miles distance is another place, where the same Catharine built a small palace, called Crasno Celo, or Beautiful Spot. On the Empress Elizabeth coming to the throne she built the present palace, with every degree of extravagance of finery. All the ornaments, statues, and vases are gilt in leaf gold on oil. The value in gold amounted to above a million of ducats. The front of the building is about 1200 feet long. The garden at the same time was laid out in Dutch taste, with straight walks, the trees all clipped in different forms, and the lateral walks lined with hedges of lime trees; the latter still exist, only that the trees are not clipped. After the death of Elizabeth, Catharine the Second, ascended the throne. About the year 1768 Count Munchausen published a book in German, called the *Hausvater* (Father of a Family,) the reading of which seemed to give Catharine a taste for modern gardening. She immediately ordered that no trees should be clipped in any of the imperial gardens, but they should be left to nature. After this she told her architect, and gardener, that in making gardens they should endeavor to follow nature; but this they could neither feel nor comprehend; they attempted to vary the straight line, by planting single trees on each side of the serpentine walks. This did not please; for though the Empress could not exactly direct then what they ought to do, yet she felt convinced in her own mind, that what they had done was not right. At a small distance from the garden there was a brook, of which the water meandered in a very pleasing style; before she left the country residence, which was about the first of September, she ordered a walk to be made on the side of the brook. This was completed, and in the spring of the year she went to see what had been done, and found they had made a walk on the side of the brook, but had kept it parallel with the brook, and had planted single trees at equal distances on each side of the walk. On her coming up to it she said "No; this will not do; this is not what I wanted." On finding she could have nothing done to her mind, she determined to have a person from England to lay out her garden. John Busch, of Blackney, was the person who was engaged to come out to Russia for this purpose; he was preferred on account of his speaking the German language. In the year 1771 he gave up his concern at Blackney, with the nursery and foreign correspondence, to Messrs. Loddiges. In the year 1742 he commenced his first work, though not at Tzarso Celo but on a hill about five miles nearer town, called Pulkova. In 1774 the Empress paid her first visit to this place. On entering the garden, and seeing a shady gravel walk, which was planted on each side, and winding, she appeared struck with sur-

prise, and said, "This is what I wanted." This walk led to a fine lawn, with gravel walks round it, which seemed to strike her more forcibly, and she again said, "This is what I have long wished to have."

ON WINTER PRUNING THE VINE.

In the culture of the vine it is sometimes necessary to lay in shoots of great length, as is the general practice in pine stoves, or to fill the trellis in common vinerias. In such cases much care is required that a regular and sufficient number of the fruit buds should break from top to bottom, and prevent the lower part of such shoots from being quite naked and barren. To avoid this let the pruner, after cutting the shoots to the required length, and finding from the firm texture of the wood, that it is sufficiently ripened, proceed to thin the buds as follows; viz. leave the uppermost bud, which may be called 1, cut out 2 and 3 leave 4, and cut out 5 and 6, leaving 7, and displacing 8 and 9, and so on to the bottom of the shoot.

This thinning of the eyes will cause all those which are left to break regularly and so alternating with each other, that the disposition, whether for the sake of superior fruit or facilitating the future management of the tree, will be found exactly what the manager would wish; he taking care to stop all the young shoots in their progress, immediately beyond the fruit, except the lowest, which must be trained to its full length for similar management the following year.

J. MAIN.

ON FORCING STRAWBERRIES.

I place my pots for forcing in troughs two inches in depth, and seven in width. The nearer they are placed to the glass the better. The troughs ought to be well painted to make them water proof, and should at all times be kept full of water. Thus treated the plants will be found to thrive and swell their fruit much better than by any other method; while the pots being surrounded with water, creeping insects are prevented from getting to them, and injuring or eating the fruit. Kidney-beans treated in this way answer exceedingly well, grow much quicker, and are less subject to the red spider.

Ibid.

ANDREW MORTON.

PLAN FOR OBTAINING A SECOND CROP OF MELONS.

When the first crop of fruit is nearly gathered, cuttings are taken from the extremities of the shoots which show the most fruit; these are cut off close under the second advanced joint, or about the fifth leaf from the top; the two largest leaves at the bottom of the cutting are taken off, and thus prepared, are inserted in pots (24 hours) two in each pot, in light, rich soil, gently shaken down. After being watered, the pots are placed in a one light frame, on a hot bed previously prepared, and plunged therein in moderately dry soil, with which it is covered. The frame is kept close and shaded for a few days, and in a week the cuttings will have struck root. The old melon plants, with the soil in which they grow, are now all cleared out of the frames, fresh soil to the depth of 12 inches put in, and the beds well lined with fresh dung.

In ten days from the time of inserting the cuttings, they will be ready to plant out, which is done in the usual way. When the plants have pushed about fourteen inches, the end of each shoot is pinched off, to cause them to produce fresh runners; and the fruit which showed on the cuttings will swell rapidly, and in three weeks after replanting the beds, abundance of fine fruit may be expected. This way of getting a second crop is far more certain than either pruning back the old plants, or planting seedlings; because cuttings grow less luxuriantly, are less liable to casualties, and are much more prolific.

CHARLES HARRISON

ON THE CULTIVATION OF PLANTS IN MOSS.

From Mr Street's success in growing plants in moss, (that is, the softer kinds collected from thick and moist woods,) it appears, that in our artificial treatment of them, we may often deviate widely from the laws of nature, and yet succeed in keeping plants not only in health, but also in considerable perfection. With the greatest ease we can grow small salad herbs on flannel saturated with water; bulbs and others in water only; epiphytes on dead trees; parasites on living ones; and some plants suspended in the air. Mr. Street recommends his practice as uniting the advantages of lightness, and safety in removal, whether from pot to pot, or from one place to another.

The mosses collected for this purpose are the several species of Hypnum, viz. the purum, squarrosum, and Schreberi, with any other decayed vegetable substances which happen to be gathered up amongst them; sometimes a little sand or loam is added. The material is pressed closely into the pots, and the plants are put into them as if in mould. Cuttings of some kinds of free rooting plants strike well in moss. The subject is new and amusing, and the way to discover whether, and to what ends, it may be permanently useful, is to push it as far as it will go while it is in hand.—We hope Mr Street will do this, and favour the world with the results of his experience.—*Ibid.*

PEARL BARLEY, A SUBSTITUTE FOR RICE.

As it is equally advantageous to the public to learn the use of a known substance as the discovery of a new one, I am sure the application of barley to another branch of domestic cookery will not be disregarded by some of your readers. I can assure them, that they will find it an excellent substitute for rice. It has been long used in this country in broth; and, when boiled with milk, sometimes called Scotch rice; but by far the best way of using it is by pounding it in a mortar. In this form it fairly rivals mannacrop, tapioca, or ground rice, and can be easily procured at one twelfth of the price of the first, and one third of the price of the last substance. It was resorted to as a change of food for my children's breakfast; and the great similarity to mannacrop induced us to try it in a pudding for them, and, I can assure you, I think it one of the best of the kind—same management as with either of the others, milk, eggs, &c. &c. What we call pearl barley is the

kind used; but, I dare say, any of the kinds would answer.—*Ibid.*

A grocer in London (Robertson) has obtained a patent for preparing barley in the manner of ground rice, and we believe it is very generally used in hospitals, and as food for children.—*Ed.*

INTERNAL IMPROVEMENT.

The following document has been sent to all the towns in this state, lying on and near the expected route for a rail-road from Boston to the Hudson river.

The expediency of constructing a Rail Road from Boston westward to the Hudson river, must depend in a great measure upon the amount of travel, and the number of tons of various articles to be transported. The Commissioners now engaged in the survey, are anxious to obtain from the several towns, on and near the proposed routes, as full and accurate information as possible upon this and other topics connected with the subject. But the time requisite for this purpose is more than can be spared by them from their present employment. To expedite the accomplishment of their arduous labours, the Commissioners have, by their letter, specially requested the Railway Committee in Boston to afford their assistance in Boston, by a delegation from their body. Accordingly, the undersigned have been appointed, to open a correspondence with the selectmen of the several towns, and other distinguished individuals, with the view to obtain a minute and correct statement of facts, so highly important and necessary to the success of the enterprise.

In performing the duties assigned us, and with the hope to develop some of the internal resources of the Commonwealth, we respectfully solicit in behalf of the commissioners, your immediate attention to the following inquiries:

1st. What number of tons of commodities are annually brought in and consumed, or used, by the inhabitants of the town in which you reside. From whence are they brought, and of what articles do they consist?

2d. What number of tons in your town are annually raised, or wholly produced from natural resources, within its limits, for the market? Of what articles do they consist, and to what market are they sent?

3d. What is the number, and kind of manufactories in your town—and what number of tons, of raw materials, and manufactured fabrics, does each annually transport, to and from market?

4th. What number of water powers, if any, are now occupied in your town to advantage. How many unoccupied can be procured within the same. For what purposes could they be best employed. And, if so, what additional number of tons would they probably furnish each way, for transportation?

5th. What price per ton is usually paid in your town for transportation to and from market—and what proportion is now done by hired carriers?

6th. What number of stages weekly pass to and from your town. To what lines do they belong. And what is the average number of passengers?

7th. Can good building-stone for constructing a rail-road be obtained within the limits of your town. And, if so, at what price per foot, running measure, rough-split and delivered at the quarries?

These questions we hope it will be in your power to answer with a considerable degree of

accuracy, by the assistance of such intelligent persons as will be ready to co-operate with you in the inquiry. The information thus obtained must form the principal data, on which to calculate the amount of business which would be facilitated by the proposed rail-road. The increase of business to be expected from a great diminution in the cost of transportation, must be in a great measure a matter of conjecture, or on which all computation must be in some degree uncertain.—As, however, the opinion of intelligent gentlemen in different parts of the commonwealth, of the probable increase of business, and of the value of property, in their respective towns, consequent to the proposed improvement, will be entitled to great weight, we venture to propose the following additional questions, to which we solicit an answer, provided your inquiries shall enable you to form an opinion. Any reasons which you may think it important to give, in support of those opinions, will add to the value of your answer.

8th. What number of acres does your town contain? What is the average price per acre?—And how much would a rail-road, with an increase of settlements like those now generally on the Erie canal, enhance the value?

9th. If the price of transportation was reduced to one seventh part its present cost, so that plaster of Paris, and other manures, could be cheaply furnished, what additional quantity of agricultural produce would your town probably furnish annually for the market?

10th. If the price of transportation was reduced as above, what other articles in your town, such as wood for fuel, lumber, granite, marble, lime, slate, and other building materials, iron ore, peat coal, clay, &c. would be increased in value? And what quantity, if any, would probably be annually furnished for transportation?

Should a rail road be located through your town, and owned by the state, would the land necessary for the same, and the fences, be given?

The importance and public nature of the subject will excite an earnest desire for a reply as soon as possibly consistent with your convenience. For that, and any further information you may have the goodness to communicate, connected with the great object in view, you will please to accept a grateful and lasting acknowledgment.

With the highest respect, we have the honor to be, Gentlemen, your most obedient servants,

ABNER PHELPS,
NATHAN HALE,
HENRY SARGENT,
WILLIAM FOSTER,
ANDREW J. ALLEN,
J. P. BIGELOW.

Boston, Sept. 12, 1827.
[Please to direct to Dr. Abner Phelps, Boston, by mail or otherwise.]

COTTON IMPROPER FOR WOUNDS.

The real cause of the ill effects of cotton when applied in the dressing of wounds is to be seen in its formation. On viewing the fibres of cotton in the microscope, and under considerable magnifying powers, it will be found that each fibre is flat, like a ribbon with sharp edges, which no doubt act in lacerating instead of healing wounds.—The fibres of flax or linen, on the contrary, when viewed in the microscope under similar circumstances, and especially when the flax has been dressed in the best manner, present the appearance of polished cylinders beautifully transparent. Hence the superiority of linen will be self-evident. And it shows that the microscope will frequently afford an unerring test of the real causes of the good or

ill properties of substances, when improperly applied, in their examination.

CAUTION TO FRUIT EATERS.

The mischiefs arising from the custom with many people of swallowing the stones of fruit are very great. In the Philosophical Transactions, No. 282, there is an account of a woman who suffered violent pains in her bowels for thirty years, returning once in a month, or less, owing to a plum stone which had lodged. There is also an account of a man, who, dying of an incurable cholera, which had tormented him many years, and baffled the effects of medicine, was opened after his death, and in his bowels was found the cause of his distemper, which was a ball composed of hard and tough matter, resembling a stone, being six inches in circumference when measured, and weighing an ounce and a half: in the centre of this there was found the stone of a common plum. These instances sufficiently prove the folly of that custom saying, that the stones of fruits are not unwholesome. Cherry-stones, swallowed in great quantities, have occasioned the death of many people; and there have been instances even of the seeds of strawberries, and the kernels of nuts, collected in a lump in the bowels, and causing violent disorders, which could never be cured till they were carried off.

BACON, HAMS, TONGUES, &c.

The usual composition of nitre, and culinary salt has been found to preserve meat much better when a small quantity of a mixture of the nitric and muriatic acids, in equal proportions, is added. A teaspoonful of this mixture is sufficient for a pound of culinary salt, with the usual proportion of nitre. We are informed that beef, mutton, pork and tongues, salted in this manner during the hottest days of summer, though slightly tainted, have kept as long as pig's meat that was salted in the common way during cold weather, and that the flavor of the meat is superior to that of the best hams. The composition is very similar to the superchlorate of soda, which is as powerful a corrector of tainted meat, as the chloruret of sodium, or potash. If it be desirable to impart a fine smoky flavour to the meat, a dessert spoonful of the impure pyrologeous acid may also be added to each pound of salt. [Gaz. of Health.]

CIDER.

It is a matter of wonder, why, with the exception of New-Jersey, and Dutchess and Orange counties in New-York, no part of the northern and middle states should have the reputation of making good cider. By good cider we mean that which will not become so sour as to be unfit to drink in two or three months after it is made. New-England throughout, possesses a soil which produces every variety of apples in the greatest abundance, and yet we suspect that it will be found that very little cider, comparatively, finds its way from thence, either to the city of New-York, or other places still farther south. At any rate, we hear of none from that quarter which is held in repute, like that from New-Jersey. The public tables in New-York are not supplied with good cider except at a charge of 25 to 50 cents a bottle.

As cider forms a very considerable article of export from our country, we take this opportunity to suggest, that establishments in the interior might, we doubt not, be made profitable by sending

vider to the city, either bottled, or fit to be bottled, as an article of merchandize.—[N. Y. States.]

GOLD MINES.

We frequently see in papers from abroad, the most extravagant statements in relation to the Gold Mines of this state. We have observed the following article published in many of the Northern papers:

"It is stated that the members of the company formed to work the gold mines of North-Carolina, have divided each \$3000."

From whence, or from whom, this statement was derived, we are not able to ascertain; but its wide variance from the fact, would induce us to suspect it first met the public eye in prints remote from the operations of the "company" alluded to.—Three thousand dollars may have been "divided," by "each" member of the company, for aught we know, for we (fortunately for once) did not embark in the speculation; but we are well assured, that if that much money has been "divided" by the company, it has been in *instalments* rather than in *profits*.—*Carolina pa.*

Three live ostriches have recently been brought to Boston from Cape de Verdes. The Traveller says the largest, only eight months old, in a natural posture, is nine feet high—the others are younger and smaller but seem growing rapidly. They swallow bones, broken stones, and iron nails, with avidity, and the gastric fluid of the stomach, possesses the peculiar property of dissolving them in a little time. The plumage is at present, rather disordered, as they have plucked each other's feathers on the passage. The bird has but two toes on the feet—the leg, large and white as a man's arm, is a great curiosity of itself. Its eye is large and vacant, and what is remarkable, the ostrich appears entirely destitute of attachments to its own species, or those who have them in charge. The natives oftentimes ride them—and though their wings are too small for flying, their speed over the deserts of their own native country is far greater than the fleetest Arabian horse.

Preservation of Grain, &c. from Mice.—Mr Donald, of Scalpa, in the Hebrides, having some years ago suffered considerably by mice, put at the bottom near the center, and the top of each stack or mow, as it was raised, three or four stalks of wild mint with the leaves on, and never afterwards had any of his grain consumed. He then tried the same experiment with his cheese, and other articles kept in the store and often injured by mice, and with equal effect, by laying a few leaves, green or dry, on the article to be preserved.—From these results, it must be inferred, mice have an antipathy to the smell of mint; if so, it may be worth experiment to scatter a few drops of oil of peppermint in pantries and places where they frequent, as the effect will probably be the same.

Miner's Journal.

Red Ant.—In answer to the enquiry in the American Daily Advertiser of yesterday as to the means of destroying or driving away the small *Red Ant.*, a gentleman called at this office to mention that if a small piece of camphor be laid in any place infested by them, they will, in a short time, entirely disappear.—*Philadelphia pa.*

129,000 bushels of salt were inspected at Salina, during the month of July.

An efficacious plan for Salting and Smoking Meat.—The following method, which requires only *forty-eight hours*, may be adopted for salting and smoking meat. A quantity of *salt-petre* equal to the common salt that would be required for the meat in the usual way, must be dissolved in water. Into this, the meat to be smoked, must be put, and kept over a slow fire, *till all the water is evaporated*. It must then be hung up in a thick smoke for *twenty-four hours*, when it will be found equal in flavor to the best Hanburgh smoked meat that has been kept several weeks in salt, as red throughout, and *equally firm*. This method has been resorted to in Ge many and other parts, and has been found by far preferable to any other plan.

Montgolfier.—Montgolfier, besides being the inventor of aerostatic balloons, was the first who manufactured vellum paper in France. The accident which led him to the formation of balloons was curious enough; one day, in his paper manufactory, he was boiling some wafers in a coffee-pot, which happened to be covered with a piece of paper in the form of a sphere, and this paper becoming full of steam, swelled and detached itself from the pot. Montgolfier was surprised, and repeating the experiment, the paper again ascended; this led him to calculate the effect of a rarified air which should be lighter than the atmospheric air.—and hence the invention of aerostation.

Skill of the Athenian Masons.—If there be one thing more capable than another of giving us a correct idea of the rare skill acquired by the Athenian workmen who were employed in constructing those buildings, which still constitute the glory of that industrious city, it is the perfection with which the drums, forming the parts of the largest columns, were fluted on the conical surfaces, and with which these different truncated cones were so adapted to each other, that the grooves of fluting, when put together, were in complete unbroken continuity, from the capital to the base of the column.

Fruits of the American System.—Mr EZRA CHILDS, an enterprising farmer of Bath, N. H. sheared from his flock of 182 merinos, 481 lbs. wool; from which he manufactured 16 pieces, 435 yards of fine cloth. He is now on his way to market with these fruits of his industry. The cloth was dressed by Messrs. Wetherell & Hunt of Bath, and is of excellent quality. Instances of this kind are not rare, and they afford the best practical commentary upon the wisdom of measures, which shall serve to protect this branch of national economy.—*N. H. Journal.*

The number of bricks made and used in Springfield, the last year, was 47,000,000; and during the last four or five years, the average import of lime has been 300 tons, a great proportion of which is from Berkshire county, and would, of course, be conveyed on a railway.

To make Champagne from Grapes.—Gather the grapes when they are just turning, or about half ripe; pound them in a tub, and to every quart of berries so pounded, put two quarts of water—let it stand in a wash-tub for fourteen days, when it is to be drawn off—and to every gallon of liquor put three pounds of lump sugar: when dissolved, cask it, and after working, bung it down. In

about six months it will be fit to drink, when it should be bottled and tied down, or wired, if it is intended to be kept more than one year.

To prevent Dogs from Sucking Eggs.—Take of emetic tartar from four to eight grains, according to the age and strength of your dog, break the end of an egg, put in the tartar and mix it—if your dog is disposed to suck eggs, he will readily eat it. Confine him from cold water—the next day repeat the dose, which continue to do on each succeeding day until he refuses it, which will probably be the third or fourth day. After this, I have never known them guilty of the like offence—instead of being the destroyer of our good wives' poultry, the same dog becomes their faithful protector.

A dreadful earthquake had occurred at Tohobacan, South America, on the 12th of July. In describing it a writer says, "the whole orb as it were confounded, seemed ready to sink in chaos." Most of the private buildings were rent open and the convent and parish church suffered greatly.

The Vine.—A very neatly written and useful little work, by Mr Loubat, called "*The Vine Dresser's Guide*," has been published in the English and French languages, in order to point out the soils and explain the culture of this important and valuable plant.

The experience of Mr Loubat in this branch of horticulture, if we may so call it, amply qualifies him for the task of an instructor, and he performs that task in a very sensible and amiable manner, in the little work before us.—*V. Y. Enquirer.*

A valuable and handsome octavo volume, entitled "*HINTS FOR AMERICAN HUSBANDMEN*," has just been issued by order of the Directors of the Pennsylvania Agricultural Society. It consists chiefly of communications, of a practical nature, to that society, and its worth is enhanced by some very neat and appropriate engravings.—We scarcely need to mention, that a considerable and estimable portion of its contents is from the pen of JOHN HARRIS POWELL, Esq. of our city; who, we presume, has edited the work, and to whom American agriculture, in the most comprehensive sense, is so largely indebted. His intelligence, zeal and success in the various departments of husbandry, must secure for him the regard and gratitude, not only of actual farmers, but of all patriotic citizens who understand the public usefulness of agricultural pursuits. The main topics treated of in this volume are, Neat Cattle; Sheep; Crops and Manures; Substitutes for Hay; Grass Lands; Art of Breeding; and Root Crops. We have marked a few of the papers, for the purpose of copying them hereafter into our first page, if we should find the opportunity of so doing; they would be interesting to all general readers. The whole will, no doubt, be ere long in the hands of most of the American country gentlemen. Some of the original communications are from England, others from different States of our Union.

Nat. Gaz.

Mr Thomas B. Robertson, late Governor of Louisiana, has been invited to be again a candidate for that office. He declined the invitation, saying "my ambition in that respect is satisfied, and experience has sufficiently taught me, that I can render in that situation no service at all commensurate with the important duties it imposes."

The following was selected some months since for insertion in our paper, but was then omitted in consequence of a press of matter, applicable to the current season, and which if deferred would be in some measure like a last year's almanack. It was therefore laid by for the present; and at length concluded to defer it till near the time of year in which it was delivered; when similar festivals will render its remarks as well timed as they are judicious and well expressed.

Extracts from an Address delivered before the Hartford County Agricultural Society, October 12, 1826.
BY REV. CHARLES A. GOODRICH.

Scarcely half a century has elapsed, since the commencement of the present system of giving an impulse to Agriculture and mechanical efforts, by Shows and honorary rewards. This short period however, has elicited the opinion of many in their favor, and given to agricultural societies and their exhibitions, no small influence in the civilized world. Fifty millions of men, in Europe and America, are now their advocates. In England, societies are numerous and efficient. Three establishments only, in the United Kingdom, annually expend, in the promotion of Agricultural objects, the sum of \$70,000. France has nearly one hundred annual shows, besides a national exhibition at Paris, once in three years, whose lists of premiums alone, would fill, it is said, an octavo volume of 350 pages. In the United States, in the short space of about twenty years, agricultural societies have increased from a single one to between fifty and sixty. Among the patrons of these societies, too, both here and abroad, are to be found men of the most cultivated and enlightened minds, of deep philosophical research and practical skill, and of the highest official rank. Surely, such men as Malinon, Quincy, Pickering, Powell, Lincoln, and Peters, not to mention many distinguished names in Europe, would not lightly favor a system, designed only to amuse a rabble, or destined to be ephemeral in its existence and influence. If public opinion, then, be any test—if the sanction of the wise and great carries any weight, it must be admitted, that too much importance has not been given to agricultural societies. The exhibitions of such societies are always connected with much that is interesting and instructive. Is the farmer an admirer of the animal creation? He here sees domestic animals, both native and imported, of the finest forms and choicest qualities. Is he an admirer of the vegetable productions of the earth? Here are exhibited specimens, which shew, that if in the sweat of his brow, man must toil, a munificent Providence does not let him toil in vain. Is he pleased with the exhibitions of mechanical skill? Here are implements the result of genius, of patient, persevering industry, which will abridge his labors; and here, too, are proofs, not the fewest, nor the meanest, that the daughters of our land can put their "hands to the spindle," and are not ashamed of the "spinning wheel." In short, the farmer has only to demonstrate, that if the last age of improvement has arrived, it has not yet made its exit from the world. The human mind is still ascendant. God has not prescribed a limit to the genius of man; or if he have, that limit is not yet seen. True, we may never be able "to plough by steam, nor sow by steam, nor by the novel combinations of the mechanic powers;" yet, who has fully tested the energies of nature, or can not foresee what philosophical investigation, combined with practical skill, may not accomplish? Who will affirm that discoveries and improvements in agriculture do not await us similar to those,

which, in the mathematical and mechanic sciences have so highly distinguished the names of Newton, Godfrey, Watt, Arkwright, and Perkins? Who, but twenty years since, dreamed of the results of the present times? Is it too much to say, that we live in the dawn of a day, whose beams by their radiance, will by and by shew, how insignificant the light is, which we now think so great?

But from fancy, if this be fancy, let us descend to the facts. I ask you to notice for a moment, some improvements, which have been made in this country in agriculture and its branches, within the last twenty years, the merit of which must be accorded to Agricultural Societies.

At the commencement of this period, the highest crops of potatoes were stated at 300 bushels to the acre—now, crops of this vegetable are not unfrequently made of from 400 to 700 bushels. Then the highest quantity of corn gathered from an acre was from 40 to 50 bushels—now, we read of numerous crops of from 60 to 120 bushels, and, in a single instance, of one which reached 172 bushels. In the mean time, many valuable roots and plants, such as the mangel wurtzel, the swedish turnip, the carrot, the common beet, the cabbage, some of which were before scarcely known, have been introduced as general crops, and yield hundreds of bushels to the acre. Many new implements of husbandry have been introduced, and former ones improved, adding greatly to the convenience and profit of the farmer. Our farms are better ploughed, better manured, better seeded, better drained, and better fenced. Numerous flocks of Spanish and Saxony sheep have been introduced, which furnish to our manufacturers the material for fabrics, which already rival those of Europe. Through the instrumentality of some gentlemen, much zeal has been excited throughout the country, to improve other descriptions of domestic animals: and with what success, every year furnishes proof, which must come with a welcome to those who have pioneered the way, at the expense of much time and wealth.

Permit me to suggest, in the first place, the importance of our farmers, as a body, becoming men of more reading and information in their professions. The experience of an individual must of necessity be limited. He has not time, nor often neither the requisite wealth nor capacity to institute experiments of importance. How, then, shall his deficiencies be supplied? Obviously by the same means by which the deficiency of the lawyer, the divine, and the physician are supplied—by reading. Let the farmer, then, purchase, as he is able, a few well selected books on the subject of agriculture—to these let him add a paper, or two, devoted to the same subject of which, happily, we have now several of high character;—and to these let him devote a portion of the dark days of autumn, and the long evenings of winter. From these, every farmer may derive many valuable hints. He will find, perhaps, an account of some new and useful implement of husbandry; some new grass or grain; some improvement in the management of a crop of corn; some remedy for a disease afflicting his family horse; or some valuable suggestion about wintering his sheep. Besides relieving the tediousness of many an hour ordinarily dozed away in his corner, he will thus

* Messrs. J. & M. Pratt, of Easton, Madison county, New York, in 1822, raised 172 bushels and two pecks of corn, on an acre. See *New-England Farmer*, p. 331, also, *Farmer's Guide*, p. 92.

be adding to his stock of useful knowledge; and be preparing in the ensuing spring and summer, to bring to some profitable account the knowledge which he has gained. The vast improvement in Agriculture in Great Britain, within half a century, is attributable, in no small degree, to the circulation of facts and experiments, by means of treatises, pamphlets and papers. It is to be hoped the time is not distant, when the farmers of this country, and elsewhere, will give to this subject its merited attention. Might I venture to name a single publication, which more than any other seems adapted to general use among our farmers, it would be that of the *New-England Farmer*, a weekly paper published at Boston. Its Editor is as enlightened as he is industrious, and makes his paper a vehicle of information on Agriculture, and its kindred subjects, of the most interesting and profitable kind.

Another point to which I beg your indulgent attention, is the importance of that management of a farm, which regards it as a whole. By a bold and vigorous effort, a farmer may, in a given instance, and on a favored spot, raise a crop of uncommon magnitude; and yet this crop, by demanding that labor which is due to other parts of the farm, may, upon the whole, operate as a loss. No farmer should possess more land than he can watch over with proper care; and his industry should have one uniform direction, and one ultimate tendency—the melioration of the whole farm. Like a wise father, if he have favorites, he should still discharge his duty to the whole circle of children. Each acre should receive that attention which it deserves, viewed as a member of the whole, and that cultivation, which will best bring its powers into action. Indeed, on the portions least favored by nature, he should, perhaps, bestow the most cultivation, on the principle which, it is said, parents should act in sending unlikely sons to college—to make them equal to the rest. It is attributable to this partial and unenlightened management, that so many of farms present a chequered and unsightly appearance. A few particular lots are selected, which are cultivated with great assiduity; while other lots are neglected and despoiled. No regard is had to the farm as a whole; no system of general operations is pursued. The farmer gathers what he is able from these few well cultivated portions, and rests contented. By some of our farmers, the beauty of a farm is judged to lie much in contrast; and hence some portions of their land are neglected through fear that the bramble, the thorn, the thistle would otherwise find no dwelling place on earth.

These observations apply to no part of our farms with more force, than to our *pasture grounds*. Upon these a thought is scarcely ever bestowed. Buses and briars and thorns and thistles are suffered to usurp dominion in the very heart of a farm, and to show a pointed and painful authority over the stock—besides operating to a total loss of many per centum of the value of these grounds. The consequence is, that where a couple of acres, or even less, would keep a cow, several become indispensable. And after all, the pastures are fed close; the dairy suffers; and a stock of meagre, half famished cattle come in in the fall, and continue lank through the winter. A few days spent upon these "neglected spots" each year would enable the farmer, especially if they were thrown into small enclosures, to admit of alternate changes of the stock, to keep more, and keep them in

better condition. In short, were the farmer's attention directed more generally to his farm, as a whole, his fertile plains would in process of time become fertile fields; his dairy would be more profitable; his stock improved; his farm be more valuable, and his reputation be rescued from merited reproach. (To be concluded next week.)

GEOLOGICAL SURVEY OF WORCESTER COUNTY.

The citizens of Worcester County, alive to their interests, intend to institute a geological survey of every town, for the purpose of aiding Agriculture and Manufactures. A gentleman, by the name of Holbrook, has recently addressed a series of questions, on the subject, to each town, and has offered to each a set of specimens of the most valuable productions of the mineral kingdom.—Such a mode, of developing the natural advantages of old Essex, should be adopted. We are persuaded, that it would be advantageous to us. A few years ago a Society for this purpose was projected among some of our young citizens. Have they not enough of public spirit, to renew the project, and carry it into execution?—*Salem Observer.*

SUBTERRANEAN FOREST.

The second volume of the Transactions of the Geological Society of London, "contains a very interesting account of the subterranean forest, which was laid open in Norfolk, Eng. last autumn, by the sliding off into the sea of a large avalanche of rocks and clay.—The forest occupied a bed of about four feet in thickness. The trunks were found to stand, as thickly as usual in woods.—The stumps appeared to be firmly rooted in the original soil, "but they are invariably broken off about a foot and a half from the base." The stems and branches lie scattered horizontally, and among them are thin layers and cakes of decomposed leaves. The species of the timber is principally that of the pine, but there are some specimens of elm and oak. This forest extends twenty miles, and is from ten feet to two hundred feet below the surface of the earth.—*Salem Obs.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, SEPT. 21, 1827.

POULTRY HOUSES, &c.

Beatson, an English writer (*Com. to the Board of Ag. vol. I.*) is of opinion that poultry always ought to be confined, but not in a close, dark, diminutive hovel, as is often the case; they should have a spacious airy place, properly constructed for them. Some people are of opinion that each sort of poultry should be kept by itself. This however, he says is not absolutely necessary, for all sorts may be kept promiscuously together, provided they have a place sufficiently large to accommodate them conveniently, and proper divisions or nests for each kind to retire to separately, which they will naturally do themselves.

Mr. Wakefield of Liverpool, says the compiler of "The Complete Grazier," keeps a large stock of poultry in the same enclosure with singular success. He has nearly an acre enclosed with a close slab fence about seven feet high. The top of the fence is every where sharp pointed like pickets, though perhaps this may not be necessary. Within this enclosure are put up slight small sheds well secured from rain however, for the different kinds of poultry, and it is supplied with a small stream

of water. The poultry is regularly fed three times a day with potatoes boiled in steam, which is their only food except what grass may grow in their enclosure. The quantity of dung which is made in this poultry place is also an object worthy of attention; and when it is cleaned out, a thin paring of the surface is at the same time taken off which makes a valuable compost for the purpose of manure. But for keeping poultry on a small scale, it is only necessary to have a small shed or slight building, formed in some warm, sheltered, sunny situation, if near the kitchen or other place where a fire is constantly kept, so much the better, with proper divisions, boxes, baskets or other contrivances for the different sorts of birds, and for their laying and incubation.

Where a few poultry that take their chance at the barn door, are kept by a farmer for the convenience of eggs, and not to go to market when a fowl is wanted, no particular attention is requisite; but as in some situations they may pay well for more food and closer attention, other circumstances may be noticed. "The poultry house should," Young says, "contain an apartment for the general stock to roost in, another for setting, a third for fattening, and a fourth for food. If the scale is large there should be a fifth for plucking and keeping feathers. If a woman is kept purposely to attend them, she should have her cottage contiguous, that the smoke of her chimney may play into the roosting and setting rooms; poultry never thrive so well as in warmth and smoke, an observation as old as Columella, and strongly confirmed by the quantity bred in the smoky cabins of Ireland. For setting both turkeys and hens, nests should be made in lockers, that have lids with hinges to confine them if necessary, or two or three will, he says, crowd into the same nest. All must have access to a gravelled yard, and to grass range, and the building should be near the farm yard, and have clear water near. Great attention should be paid to cleanliness and white washing, not for appearance, but to destroy vermin.

Loudon says "The interior arrangement of a poultry house for a farm yard is generally very simple and consists of a little more than a number of spars reaching across the bottom of the building at different heights, or the same height, with a gang way or ladder attached, for the fowls to ascend; but where comfort and cleanliness are studied, a preferable mode is to form a sloping stage of spars (see *a b* in the annexed figure) for

the poultry to sit on; beneath the stage may be two ranges of boxes for nests (*c c*) the roof (*d*) should be a ceiling to keep the whole warm in winter, and the door (*e*) should be nearly as high as the ceiling for ventilation and should have a small opening with a shutter at bottom, which where there is no danger from dogs or foxes, may be left open at all times to admit of the poultry going in and out at pleasure, and especially for

their early egress during summer. The spars of which the clawed birds are to roost, should not be round and smooth, but roundish and roughish, like the branches of a tree. The floor must be dry and kept clean for the web footed kind.

A writer in the European Magazine, in speaking of this mode of managing and feeding fowls says, "I gave them corn [grain] in the morning and in the afternoon boiled potatoes mixed with Irish bran, but I never allowed them to take a full meal of corn. They had a small orchard range in, where in the course of the day, they occasionally picked up worms and other insects, and I have observed that poultry of all kinds eagerly seek for animal food, even after they have satiated themselves with corn; indeed I can perceive a portion of animal food essentially requisite to preserve them in a healthy state.

Mr. Lawrence, (*New Farmer's Calendar, page 551.*) says "Poultry are an article of luxury, for which the little farmer never obtains an adequate price. He had better allow his wife a certain annual sum for pin money than suffer her to keep these devourers. Four hens to a cock or five at most. Hens set twenty one days. Leave plenty of nest eggs where you desire them to set. Take away the strongest chickens as fast as they are hatched, secure them in wool until the whole are hatched, and a d strong enough to be cooped. Hens not to be cooped near, as they may kill each other's chickens. Young poultry fed by themselves, or under coops, as the large are apt to tread the smaller to death."

It is said a little molasses or any other saccharine substance is very useful to mix with the food of poultry, which it is intended to fatten. Perhaps it might be well to boil a proportion of beets, ripe and sweet pumpkins or squashes with potatoes for the food of poultry. When corn is given to fowls it should be broken or soaked in water. Hens, it is said, should have access in winter, to slacked lime, lime mortar, or oyster shells, otherwise they will be less likely to afford eggs, as something of a calcareous nature is necessary to form the shell. Wheat, however, if given to fowls for food, will furnish the substance [phosphate of lime] which is the principal constituent part of egg-shells.

We have noticed the following among new works just published in London:

The Florist's Guide: a treatise on Tulips, Hyacinths, Carnations, Pinks, Auricula, Roses, &c. by R. Sweet, P. L. S.

Flora Australasia; description of Flowers in New Holland, &c.

Designs for Agricultural buildings, Cottages, Farm House, &c. by C. Waistell, Esq. Chairman of the Committee on Agriculture of the Society of Arts.

English Flora, by Sir Jas. E. Smith.

Essay on the different modes of cultivating the Pine Apple; by a member of the Horticultural Society.

The Gardener's Remembrancer.

Treatise on Shrubbery; by Thos. Philips, F. H. S.

It is stated in Loudon's Gardener's Magazine, which has been published in London but one year, that it has already over 3000 subscribers.

BLASTING ROCKS.

A writer in the Glasgow Mechanics' Magazine gives a statement of an "improved method of blasting rocks with gunpowder, by which not only 4-9ths of the gun-powder is saved, but which far exceeds any method I have ever seen in its execution and effects. It has been practised for near a century in the extensive mines in Sweden; and only requires to be generally known in this country to be properly estimated.

"Suppose a hole in the usual method of blasting requires 9 inches of gunpowder; instead of filling it completely, leave 4 inches next the bottom empty, and above this space put 5 inches of gunpowder, which is supported by a piece of paste-board cut to the size of the hole, with a stick underneath, and attached to it in the middle. To prevent the stick head or pasteboard from being air-tight, four notches may be made of such a size as to allow the air, but not the gunpowder, to pass thro'. Then stem it and fire it, in the usual way. The principle on which it acts, is the rarefaction of the four inches of air in the bottom of the hole, when heated by the explosion of the gunpowder, and its consequent expansive power or force.

"I cannot, perhaps, give a clearer demonstration of this force, than by supposing a fowling-piece to be loaded, and the charge not rammed home as it is called; that is, if the least air remain in the bottom of the barrel, the consequence, as every one knows, would be the bursting of the barrel.—The intention, of course, in this case is to burst the barrel."

PRESERVATION OF CABBAGES.

The London Monthly Magazine gives the following method by which the Portuguese preserve cabbages on board their ships. The cabbage is cut so as to leave about two inches or more of the stem attached to it; after which the pith is scooped out to about the depth of an inch, care being taken not to wound or bruise the rind by this operation. The cabbages then are suspended by means of a cord, tied round that portion of the stem next the cabbage, and fastened at regular intervals to a rope across the deck. That portion of the stem from which the pith is taken, being uppermost, is regularly filled with water during very long voyages.

The same method might be advantageously adopted in private houses.

TAINTED FISH.

It is stated in the Glasgow Mechanics Magazine that fish which is slightly tainted may be restored to its proper flavour by mixing a quantity of vinegar and salt in the water in which fish is to be boiled.

VINES.

Linnean Botanic Garden, near New York, Sept. 17, 1827.

MR FESSENDEN—Well versed as you are, sir, on subjects of Horticulture, I feel sure that you will agree with me, that in the establishment of vineyards, no one point is of so much importance as a proper selection of those varieties best suited by their nature and qualities to their destined localities. We must not of course take the grapes of the south of France for the northern states, nor should we take those of the north, for the southern states, if others offer more advantageous. The fact is, in forming new vineyards, even in France, this is a nice point to be considered, and

on which mainly depends ultimate success. Of how much more importance then must proper discrimination be to a country new in this species of culture? Impressed with these ideas I have in my "Short Treatise on Horticulture" now in the press arranged the most celebrated European grapes under the three following heads, viz:

1st. Grapes of Germany, Switzerland, and the north of France.

2d. Grapes of middle France.

3d. Grapes of the south of France.

I have also given particular descriptions, in detail, of 68 varieties of grapes. With this aid in making suitable selections, I think our judicious Horticulturalists will not be at a loss to discriminate and select such as may be calculated to succeed in the respective localities to be allotted them—you are no doubt aware as well as myself of the great importance of another point, viz:

Accuracy as to the kind of grape named, for it must have become well known that many inaccuracies frequently occur, and that without this precaution is well attended to, all other exertions may prove futile. It has been my wish in this little publication, to throw as much light upon all the points referred to as its limits would permit.

In addition to the subject of Grapes, this publication contains directions for the culture of almost every species of fruit found in our Gardens, and descriptions of a number of varieties of each species. In fact, sir, deeming such a compendium, *mostly gathered from personal observation*, as much wanted, I have put this small work to press hoping that it might prove acceptable to the public, as a prelude to my general publication on "AMERICAN HORTICULTURE,"—and the expense will be so trifling as to be no object to any one.

Yours most respectfully,

WM. PRINCE.

FRUIT TREES.

MR FESSENDEN—Your correspondent "W. D." in a late New England Farmer, asks—*will suckers proceeding from the roots of trees, if grafted, make as good and fruitful trees as seedlings?*—No answer having been given by the more competent to this inquiry, I am induced to say that as far as my experience has extended, seedlings are much to be preferred to suckers.

For this, some obvious reasons may be given.—The seedling is taken when known to be young and vigorous—its roots healthy and diverging equally from the stock, may be preserved with little injury by removal. It is not so with the sucker.—The roots are in general very unequal and imperfectly procured—the sucker proceeding from the root, when removed carries with it an useless portion thereof, with the dispositions and diseases to which the parent stock is liable; and, further, if the life and vigor of the tree depends upon the age and condition of the stock, whether grafted or not, which is generally admitted, and which experience seems to confirm, your labour will be little or no effect. In most cases you will be at an uncertainty, and at best will lose a portion of the duration of the tree you propose to cultivate.

In the apple I have made many successive experiments in two modes. First, from cutting away an old stock, and then grafting the vigorous shoots or suckers from the root.

In these cases an extraordinary growth was had. But this was for a short time only. The ends of the limbs soon began to perish, and every means

of restoring health to the trees has, with me, unfortunately failed.

The other mode, by taking up and removing the suckers of the apple tree to a favourable situation, even though sometimes attended with a degree of success, yet, in every instance where any just comparison could be made, the seedling stock in its progression and maturity has had greatly the advantage.

The pear tree sends forth many, very many more suckers than the apple tree. Most of our stocks, it is believed, are brought from New Hampshire; all are not competent to judge whether they are suckers or seedlings.

But the pear being a longer lived tree, may for that reason present in suckers a better stock for grafting than the apple. But here too the force of experience is in favor of the seedling.

For many years I have improved the New Hampshire stocks for grafting, and though to advantage in some instances, yet I am bound to say less so in these cases, generally, than in those of known seedling stocks.

As to the smaller fruits, such as plums, cherries, &c. the little experience I have had has been to the same conviction as to the comparative inferiority of the sucker.

There is besides a general objection made to transplanting the sucker—that it is apt to throw forth suckers to the injury of the soil.

It must be considered as going to the establishment of this position, that the seedling forest trees are by far to be preferred. Having raised from the seed for ornamental use, a number of the elm, American and English ash, &c. I have found them in ten years to acquire double the growth of suckers. The English elm (so called) have been hitherto with us, it is believed, wholly propagated from the sucker, and it is often so with other forest trees.

In what has preceded I have referred to the principle that the graft is but the transfer or elongation of the *parent stock*, and is subject to those laws which govern its growth, maturity and decay. As to this, there is a difference of opinion, as there may be on other suggestions herein made. But I cheerfully offer what has occurred to me, and would (like your correspondent) being in search of truth, be right glad of better instruction.

I am, sir, yours,
J. WELLES.

Dorchester, Sept. 1827.

Remarks.—We deem it proper to mention that at the time of writing the above, Mr WELLES had not seen the remarks of the Hon. O. FISKE in our paper of the 7th inst. Several of our best horticulturalists in this vicinity fully coincide with Mr WELLES. Mr FISKE's success may be an exception to the general rule. The great care and good cultivation he bestows on his trees might overcome almost any obstacles.—Eo.

SUNFLOWER.

MR FESSENDEN—An account in the N. E. Farmer of the 14th inst. of a gigantic Sunflower growing in West Chester, Pa. the height of which was stated to be 12 feet and 1 inch, induced me to measure one in my garden, which came up from a seed accidentally dropped, and has attained without any cultivation, the stature of 12 feet and 8 inches. The stalk measures 6 inches in circumference 3 or 4 feet from the ground, and supports 40 flowers, though none of them are so large as that of the Pennsylvania Anak, which was 4 feet in circumference, and was compared to the rising moon.

INDIAN CORN.

And since I have taken up the pen, allow me to say, that Indian corn sown broadcast for fodder is a very valuable and certain crop; of this, the experience of two dissimilar seasons has convinced me. In the extreme drought of the last year and the abundant moisture of the present, the crop has prospered and generously compensated for the labour and expense bestowed on it. Three quarters of an acre of ordinary land, with a light dressing of manure, from one and a half bushel of seed, produced me two tons (by estimation) of excellent fodder. With skillful management, I have no doubt the product might be doubled.

A Subscriber in Essex County.

FARMER'S FESTIVAL.

The Cattle Show, Ploughing Match, and Exhibition of Manufactures, of the Massachusetts Agricultural Society will take place at Brighton, on Wednesday, the 17th of October.

That of the Essex Agricultural Society, at West Newbury, on the 10th of October.—We understand the Committee of Arrangements have passed a vote that no ardent spirits or wine be used at the dinner table.

The annual Cattle Show, Ploughing Match, and Exhibition of Manufactures, of the Society of Middlesex Husbandmen and Manufacturers, will take place in Concord, Mass. on the 10th of Oct. next. The Oration on this occasion will be delivered by Hon. EDWARD EVERETT. We mention this fact now, for the second time, (says the Concord Gazette,) because the inquiry has frequently been made, whether his health is sufficiently recovered, since his late sickness, to enable him to fulfil his engagement in this respect.

We are desired to mention, that the time for trying the strength of working cattle will be after the services in the Meeting-house.

Liberal premiums have been offered for the largest crops of Indian Corn, Wheat, Carrots, Barley, Turnips, Onions and Hops, to the acre; and for the best plantations of White Oak, White Ash, Elm, and fruit trees.

The Cattle Show, &c. of the Worcester Agricultural Society will take place at Worcester, on the 10th of October.

Those persons intending to become competitors in the Ploughing Match at Worcester, on the 10th of October, are reminded, that Tuesday, the 25th inst. is the last day on which entries can be received by the Secretary for that interesting part of the exhibition.

The Society offer a premium of fifteen dollars for the best team of working oxen from any town in the County, of not less than sixty yoke, with one dollar for every mile's travel from the centre of the town. As early notice as may be convenient is requested from any towns which embrace this liberal offer. By order of the Com. of Arrange.

The Hampshire, Franklin, and Hampden Agricultural Societies hold their Annual Show at Northampton, on the 24th of October.

A large and respectable Agricultural Society has been formed in Cumberland county, Pa. whose Show will take place on the 1st and 2d November, at Carlisle. We perceive they have offered liberal premiums for the best managed farms—for the best crops—horses—neat cattle—sheep—

swine—implements of husbandry—domestic manufactures, &c.

In Ohio, the Hamilton County Agricultural Society have offered a *silver cup*, of the value of fifty dollars, or fifty dollars in cash, at the option of the successful claimant, for the best crop of *barley on ten acres* of ground; and also a *silver cup* of half the value, for the best crop on *five acres*, all to be raised in Hamilton, and the four adjoining counties.

On Wednesday and Thursday, the 19th and 20th inst. the Cattle Show and Fair for Hillsborough County, took place at Milford, (N. H.) and it was expected to be equal any former exhibition in the county. Suitable preparations were made, and a commendable zeal manifested among the yeomanry of that excellent county.

We are informed by Mr HAYWARD, clerk of the Faneuil Hall Market, that 2700 bushels of peaches, have been brought in during the last 9 days.

FRESH IMPORTED DUTCH FLOWER ROOTS. On SATURDAY next, at 11 o'clock, At Cunningham's Auction Room, corner of Milk and Federal streets.

Two invoices of Bulbous Roots, just received per brig Janus, from Rotterdam, being direct consignments from the celebrated florists, J. D. Nieman Jr. and P. Van Velsen, consisting in part of double and single hyacinths, tulips, crocus, anemons, ranunculus, narcissus, jonquilles, iris, lilies, snow drops, crown imperials, &c.; with several rarer roots, such as ornithogalum arulatum, do. perulatum, colchicum, alho. do. pleno, terraria nigra, gladioli commune, &c. &c. These roots are in perfect order, and may be depended on, being put up by florists who have sent the best roots to this market for several years past. Sale positive. J. L. CUNNINGHAM, Aucr.

Fowl Meadow Grass. One cask of this day, at the office of the New England Farmer, one cask of Fowl Meadow Grass Seed—fresh and genuine.

Fresh Garden Seeds. For sale at the office of the New England Farmer, No. 52 North Market Street, Boston, a complete assortment of Garden and Field Seeds, many of which are suitable for fall sowing; a part of the seeds are of the growth of 1827; among which are Superior WHITE PORTUGAL ONION, BLACK SPANISH or WINTER RADISH, FALL BRICKLY SPINACH, for greens, DUTCH COLE, for greens—WHITE MULBERRY, Various sorts of CABBAGES, PARSNIPS, CARROTS, LETTUCE, BEETS, &c. &c.

Grass Seeds. ORCHARD GRASS, LUCERNE, HERD'S GRASS, RED TOP, RED and WHITE HONEY-SUCKLE CLOVER, &c. Also, 2 bushels fresh Canary Seed; genuine English Rape Seed; Hemp Seed, &c. for birds.

NOTICE.—Taken up and impounded in the town pound of Newton, a roan-colored horse—the owner unknown. The owner is requested to call, pay charges, and take him away. Newton, Sept. 14. 1827. JOSEPH WHITE, Fidd Driver.

Saxony Sheep. On THURSDAY Oct. 18, next, at 10 o'clock, The day succeeding the Agricultural Fair, At Brighton, (near Boston) the entire flock of *Elvoral Saxony Sheep*, imported in the ship *Meret*, Capt. Mann, from Hamburg, consisting of 161 EWES and 21 RAMS.

These Sheep were carefully selected by experienced agents for account of a highly respectable House in Leipzig, and will be found to excel any flock hitherto imported in regard to size and weight of fleece, while they are not inferior in any other particular. The large proportion of Ewes, of the finest quality, were not procured without much difficulty; and, in general, such measures were taken as to warrant the expectation that this flock will not suffer by the most rigid scrutiny of persons disposed to improve their stock by the introduction of pure Saxony Blood.

The Sheep may be examined at Brighton, at any time before the sale. Catalogues will be ready for delivery at our office 20 days previous—when Samples of the Wool will be exhibited.

The Agent pledges himself that none of the Stock will be disposed of until the day of Auction, when they will all be sold without reserve. COOLIDGE, POOR & HEAD.

WANTED.—As an apprentice to the Printing Business, an active lad, of about 14 years of age of good education and habits, and well recommended; to such an one encouragement will be given. No others need apply.

New England Farmer's Almanac, for 1828.

Just published, at the New England Farmer's Office, and for sale by BOWEN & DLARNOSS, 72 Washington Street, and at the Bookstores generally, the *New England Farmer's Almanac*, for 1828. By Thomas G. Fessenden, Editor of the New England Farmer.

This Almanac, in addition to the usual miscellaneous matter contained in similar works, contains a Calendar of the Courts for each state in New England; the Sun's declination; and 10 pages of agricultural matter on the following subjects:

On Soaking Seed Corn in copperas water—on Small Farms—on Clarendo—on Fish used as a Manure—on Gapes or Pip in Poultry—Agricultural Associations—on Fallen Fruit—on Staggering in swine—How to raise Cabbages, which shall not be chole-botted, by Dr. Green of Mansfield, Ms.—How to Fatten Poultry—A cheap method of preventing the disagreeable smell of Frieses—Root Steamer, with a drawing—on Grafted Trees—on Painting walls to Mature Fruit—on Cattle stalls—Signs of a good Farmer—on Dying Peaches—on the value of Time—Machines for gathering Clover Heads, with a drawing—on gathering—on Sir Astley Cooper's 'bubbling Ointment'—Recipes for the Ladies containing directions for making several kinds of Cakes—Miscellaneous, &c.

This Almanac may be purchased wholesale and retail at O. D. Cooke & Son, Hartford, Ct.—Holbrook & Fessenden, Brattleborough, Vt.—Isaac Hill, Concord, N. H.—John Prentiss, Keene, N. H.—John W. Foster and Childs & Sparhawk, Portsmouth, N. H.—Pearson, Little & Robinson, Portland, Me.—Whipple & Lawrence, and John M. Ives, Salem—Ebenzer Siedman, Newburyport—Hilliard & Brown, Cambridge—Ezra Clark, Plymouth—E. & G. Merriam, West Brookfield—Clarendon Harris, Worcester—A. S. Bowditch, Providence—G. Thorburn & Son, No. 67 Liberty Street, New York—and by booksellers and traders generally.

Country Dealers and others supplied on the most favorable terms.

Miscellaneous.

My thoughts are in my native land,
My heart is in my native place;
Where willows bend to breezes bland,
And kiss the river's rippling face.

Where sunny shrubs disperse their scent,
And raise their blossom high to heaven;
As if in calm acknowledgment
For brilliant hues and virtues given.

My thoughts are with my youthful days,
When sin and grief were but a name;
When every field had golden ways,
And pleasure with the day-light came.

I hunt the rushes to my feet,
And sought the water's silent flow,
I moved along the thin ice fleet,
Nor thought upon the death below.

I culled the violet in the dell,
Where wild-roses gave a chequered shade,
And listened to each village bell,
So sweet by answering echo made.

In God's own house, on God's own day,
In neat attire I bent the knee;
Pure sense of duty bade me pray—
Joy made me join the melody.

This memory from her treasured urn,
Slakes o'er the mind her spring like rain,
Thus scenes turn up and palely burn,
Like night-lights in the ocean's train.

And still my soul shall these command,
While sorrow writes upon my face,
My thoughts are on my native land,
My heart is on my native place. *A. J. American*

Activity.—Be always employed. Thou wilt never be better pleased, than when thou hast something to do; for business by its motion, brings heat and life to the spirits, but idleness corrupts them like standing water.

Extravagance.—By extravagance, the higher sort are reduced to poverty, and forced to borrow of those whom they formerly despised, but who, through industry and frugality have maintained their standing. A ploughman on his legs is higher than a gentleman on his knees.

Prudence and Economy.—Prudence will direct us to be cautious what debts we contract; but when they become due, justice requires that they be punctually discharged, otherwise we keep possession while another has the right.

Prudence.—Begin your course in life with the least show and expense possible. You may, at pleasure, increase both, but cannot easily diminish them.

Evils of Debt.—Do not consider debt only as an inconvenience, you will find it a calamity. Poverty takes away so many means of doing good, and produces so much inability to resist evil, both natural and moral, that it is by all means to be avoided.

Discovery in Africa.—Mr Ashmun, Agent of the American Colonization Society, in a recent letter, communicates the interesting information, that in the interior of Africa, there is a people so civilized as to have an improved agriculture, a manufactory of all articles necessary for their comfort, have regular and abundant markets and fairs, and use the written Arabic language in their trade, and possess "a degree of intelligence, and partial refinement, little compatible with the personal qualities," usually attached to the people of Guinea. Arrangements have been made to open

an intercourse with them, which has hitherto been prevented by the jealousy of the coast tribes.

[Salem Observer]

Influence of Civilization on Health.—The first number of the Foreign Quarterly Review, published in England contains a review of a discourse of M Berard on the influence of civilization on health, in which the author proves, that civilization "not only lengthens the average duration of human life, but adds to the strength of man."—"Longevity amid Savage Nations is not only rare, but Savages in general are more feeble than civilized Nations. Le Pere Panque, who lived much among them, says, he scarcely saw an old man; Raynal asserts the same of the Savages of Canada; Cook and La Peyrouse of those of the North-west Coast of America; Mungo Park of the Negroes; and Bruce of the Abyssinians." He refers to some experiments of Mr Peron, with the Dynamometer, by which was ascertained the relative strength of twelve natives of Van Dieman's land, seventeen of New Holland, fifty-six of the island of Timor, seventeen Frenchmen, and fourteen Englishmen of New South Wales. The weakest were natives of Van Dieman's land. The mean strength of their arms was 50 lb. That of the English which were the strongest, was 71 lb.—*Ibid.*

Importance of Manufacturing Establishments.—The Nashua Gazette states, as an illustration of the dependence of Agriculture upon the encouragement of the manufacturers, that the Great Falls Company, at Somersworth, in New Hampshire, commenced their manufacturing establishment in 1823, and at the present time there are between 1,500, and 1,600 persons engaged in the business of the Company, or who obtain their subsistence from the establishment. The persons consumed in the year which ended on the last month, one thousand nine hundred and thirty-one barrels of flour, and six thousand and fifty nine bushels of corn, received from the states south of the Hudson.

Schiller, the German poet, had a patent of nobility conferred on him by the Emperor of Germany, which he never used. Turning over a heap of papers one day, in the presence of a friend, he came to his patent, and showing it carelessly to his friend with this observation, "I suppose you did not know that I was a noble;" and then buried it again in the mass of miscellaneous papers in which it had long lain undisturbed.

Unlucky Shot.—An industrious farmer in the town of Conquest, N. Y. after having finished his haying and harvest, had stacked his wheat and part of his hay near his house. He soon after saw a squirrel upon his wheat, took his gun and shot him. But the wadding of his gun set his wheat in a blaze, and that and the haystack was in a short time consumed. There was nearly three thousand bushels of wheat, and a ton and a half of hay.

"LONG YARNS."

Mrs. —, upwards of 60 years old, and two young women in the same family, not two furlongs from our office, on the 10th inst. spun 28 skeins of woollen yarn, each skein containing 15 knots. Of this respectable day's work, Mrs. — did 8 skeins, and the young women 10 skeins a piece.

In performing her task, (as a man of arithmetic assures us) the aged matron had to walk 43,200

steps, which on calculation are found to make about *twelve and a half miles*. Here then we have no small degree of industry in the feet, as well as the fingers—especially when it is considered that in spinning, a stop is to be made at every third step, and that half the steps are to be taken backwards. Where, we ask, is the *young man*, who would undertake to travel twelve miles and a half in a day, one half the distance backwards, and stop on the way 14,400 times?

The young women, of course, had to travel a greater distance; but they are doubtless some 40 years younger than Mrs. —, and find it a mere pastime,

"To trip it as they go,
On the light fantastic toe."

At all events, we cannot do less than recommend them to the particular attention of those who are in pursuit of wives, as better calculated to make a man happy, than if they had spun a thousand miles of *street yarn*. [Berk. Am.]

The Duke of St. Albans.—Of all the jokes played off in the English papers upon the *young Duke of St. Albans* for his folly in marrying the *old Mrs. Coufts*, we have seen no keener one than this from *The Age*.

"His Grace, in a worldly point of view, is understood to be what is commonly called a *close shaver*. If that be the case, (without at all alluding to the pecuniary opportunities which may be afforded him) we can only say her Grace's countenance will keep him in constant employment, if he has nothing else to do."

Farnham's Improved Cider Mill.

A mill on this plan of full size is 4 feet by 2-1/2. The cylinder is 16 inches diameter and 9 inches long, the periphery fixed with points of iron or steel, placed in a spiral form, projecting 3/4 of an inch, placed 2/3ds of one eighth of an inch from each other, there being 17 rows around said block or cylinder, and 13 teeth in a row; the teeth may be 3d brads. The cylinder is put in motion by a whirl and band.

This mill without the power cost from 10 to 12 dollars; and by giving it 500 revolutions per minute it will grind or grate with one horse power sixty bushels of apples per hour; with two horses double the quantity. The apples are grated very fine without breaking the seeds.

There was rising of two thousand barrels of cider made in one of these mills last year, without expending one cent for repairs. Agents will shortly be out in the state of Massachusetts to sell out the rights of towns, counties, &c.

Applications, post paid, directed to JOSEPH F. WHITE, No. 213 Water St. New York, or to JOSEPH R. NEWELL, Boston, will be attended to.

The following are some of the Certificates respecting the Grater Cider Mill.

Berkshire, May 20, 1827.
I hereby certify that I have one of Joel Farnham's Grater Cider Mills in operation, and when grinding with water power, I have ground two bushels of apples in a minute, but when grinding with horse power, about half that quantity. The quantity of apples is about 7 bushels for a barrel of cider. As to the quality of the cider, I have not discovered any material difference from that made in the nut mill, but there is much less sediment, I think not more than a quart, or at most 3 pints to a barrel. A. LEONARD.

Owego, Tiocha co. June 12, 1827.
We the subscribers hereby certify that we have made cider at Joel Farnham's cider mill, at his dwelling, place, in Tiocha town, and with his Grater Cider Mill, and it will do the work complete as the above given by Mr Leonard.

G. L. TALCOTT,
J. M. QUIGG,
E. BROWN.

I, T. TALCOTT, Jr.
This certifies that I have one of Joel Farnham's patent cider mills, and it will grind from one and a half to two bushels of apples in a minute; it will grind a bushel and a half without any urging, but if urged it will grind two bushels, and the cider is perfectly clear and pleasant when well worked, and I think it will make more cider than any of the old fashioned mills.
Spencer, May 21, 1827.

W. WOODFORD.

Gentlemen who procure five responsible subscribers, are entitled to a sixth volume gratis.

HORTICULTURE.

THE VINE.

Mr. PRESTON.—As there seems to be a very general attention paid of late to the culture of Grapes, I thought it might not be unacceptable to the public to see an account of the management of grapes in France. I therefore send you a translation from a book kindly lent to me by a friend, of the *present* most approved method of training and pruning grapes in France. The work from which the extracts are taken is highly respectable. It is called the "Bon Jardinier," (a Good Gardener,) a new and much improved edition, compiled and written by Mons. A. Poiteau, ancient chief gardener of the Royal nurseries of Versailles—King's botanist and director of the culture in the Royal country seats of Guyanne—member of the Agricultural Societies of the Seine and Oise, and of the Linnaean Society of Paris—author of the Natural History of Orange trees; and also by Mons. Vilmain, (well known here by the trees sent out for sale,) seedsman to the King—member of the Royal Society of Agriculture, and of the Horticultural Society of London, &c. &c.

This work was published in 1826, and may be considered the most authoritative work on French Horticulture, extant. A CULTIVATOR.
Roxbury, August 27, 1827.

VINE.

The remarks we are about to make, apply to those species or varieties whose fruit is sought for the table, and not to those which are cultivated for wine.

A light and deep soil is the best adapted to produce excellent grapes. In poorer soils the vine languishes—in soils more consistent (more stiff,) its productions will be too gross, too watery, and its fruit will have fewer good qualities. In the climate of Paris (whose summers, though longer, agree very well with those of New-England,) the vine requires a hot or warm exposure, in order to ripen the grapes perfectly, and it is *seldom*, except under the protection of a wall with a south or eastern aspect, that it finds the heat necessary to its perfection.

Of all the modes adopted of training, or of pruning the vine, we shall only speak of one, that practised at Thomery, a village near Fontainebleau, because it appears to us preferable to all others, both for its simplicity and its results.

As to its results, all the world knows them. It is well known that the most beautiful and the best grapes eaten in Paris come from Thomery, (about 28 miles distant,) under the name of the Chasselas of Fontainebleau. It has been supposed, that the excellence of these grapes is owing to the nature of the soil and the favorable exposure of Thomery. By no means. Thomery has not a happy exposure, and its soil is clayey, cold, and almost incredibly hard to cultivate. We must admit then, that it is to their *treatment* of their grapes *alone* that their excellence and superiority is owing. Before we say any thing of their method, we would remark that they are very cautious in selecting their varieties—they take only those of the best

qualities, and keep them constantly separate and pure from inferior sorts.

The walls against which they train their grapes or trellises are about eight feet high, and are covered with a top which projects about nine inches. This protects the vine against frosts, against the violence of rain, and also prevents the upper shoot from pushing too vigorously. These walls are furnished with trellises, the upright standards of which are two feet apart, and the slats or horizontal pieces or rails, are nine inches apart; the lower one six inches only from the ground.

The grape border along this wall is dug and manured to the width of five feet, at least, and to the depth of 15 or 18 inches. If the soil is wet, they slope the border so as to throw off the water from the wall. When the border is prepared, they open a trench at four feet distance from the wall and parallel to it, two feet wide and nine inches deep. They have ready prepared a quantity of layers or cuttings, sufficient for the wall. After trimming them of tendrils and every thing useless or hurtful, they lay them across the trench at the bottom with the top towards the wall, and at the distance of twenty inches, one from the other, and cover them with four or five inches of soil, and tread them down; at the same time raising the upper end which was towards the wall nearly to a perpendicular—then fill the trench two thirds full, and spread the residue of the earth over the border. They then put into the trench three inches of manure, which keeps the plants fresh and moist, and prevents the ground from getting dry and hard.

In March, they cut in the plants to two eyes above ground; they weed, dress and water the border during the first season, if it be needful, for the young planted grape requires a gentle degree of moisture. They tie the young shoots of the year to some supporters, and do every thing to favor its growth. The second year, if any of the plants have more than one branch, they preserve but one. They bury the new wood as the first year, and so on till they reach the wall. At every time they lay the shoot they cut in till they reach strong ripe wood well furnished with good eyes (or buds)—it will generally take three years before it reaches the wall, but in the mean time, they gather some fine bunches while the grape is reaching the wall.

We now come to the formation of the bearing branches [cordons.] If the wall is eight feet high you would make five such branches [on each side,] the first six inches from the ground, and the four other, eighteen inches apart upon the horizontal rails of the trellis or espalier, arranged previously so as to effect this object. The stalk destined to the lowest bearing branch will be cut off just at the height of the branch, if it has at that place a double eye or two eyes. If it has not, you must cut it above the eye which is next above the lowest rail of the trellis. These two eyes are destined to furnish the two lowest branches (to right and left) on the lowest rail. The one that is too high must be bent down gently, and that which is too low, trained up and fastened to the trellis so that both shall be in the same horizontal line.

The second [cordon] bearing branch being at 2

feet from the ground cannot be formed as soon as the first—the third will be still more late, and so on. Whatever be the height to which you propose to carry your stalk or stem, you ought not to advance it more than 12 or 15 inches each year and preserve its lateral buds to increase its growth and furnish fruit. But as soon as the stem has reached the requisite height it is absolutely necessary to suppress and cut off all lateral buds on the main stem throughout. Let us now suppose all the stems arrived at the required or proposed height, and that their two last or upper branches are extended to the right and left to form the two arms of the bearing branches (cordons,) we will now show how these two arms or branches are to be cut till they have gained the length of four feet each.—The first year you will cut so as to have three good eyes or buds from 4 to 6 inches apart. Two of these eyes will be cut so as to form bearing wood, and the third will be employed to lengthen the branch. Care must be taken to train vertically the shoots destined to bear the fruit. At the second cutting the bearing shoots thus trained vertically must be cut leaving two eyes or buds—and the terminal branch in like manner must be so trimmed as that there will be three eyes, two of which will be reserved for bearers, and the third to prolong the shoot as in the former year, and so proceed till each lateral branch shall have reached the length of four feet. Each branch ought then to have eight bearing eyes or shoots, all if possible on the upper side. When all the five plants shall have reached their height and length, you will have on a surface of eight feet square, (or 64 square feet,) eighty bearing branches (coursors) of two eyes each, which will each produce two branches, bearing two bunches each, or 320 bunches on eight feet square of surface.

The eyes at the bottom of the shoots of the grape are very close together and extremely small. There are no less than six in the space of two lines, or the fifth of one inch. When you cut the bearing branch long, say one or two inches, these little eyes become extinct and do not push—but if you cut close to them they grow and give very beautiful bunches. Able gardeners are well aware of this, they cut within one line (or one tenth of an inch) or even less. It is for this reason that these branches never become long under their management.

Those who are ignorant of the nature of the vine cannot conceive how a bearing branch shall have given fruit for twenty years, and not be at the end of the time one inch long. If there be more than two buds start from the same branch (or cordon) it is absolutely necessary to suppress or pinch the surplus off even if they have five bunches.

The writers further caution cultivators to treat the young shoots very tenderly in training them, because they easily break off when they are young. You ought not to force them into a vertical position till the berry of the grape is large—till then, all you need do is to take off all shoots which have no grapes, to break off tendrils, and to pinch off the extremities of the bearing shoots. When the grape has nearly attained its size it is beneficial to water the fruit from a water pot 42

the form of rain. This makes the skin tender and increases the size of the berries. You gradually uncover the berries and expose them to the sun to heighten the colour and improve the flavor.

If you wish to leave them out, till after frost, you may cover them with paper bags, which are of use also in protecting them from insects and birds.

In making this translation as literal as possible, one could not avoid some gallicisms.

Such are the remarks of Mr. Vilmanin. To me, some are wholly new and surprising. I had no idea that the small and almost invisible buds at the root of the branch were there, which produced the exquisite grapes sold in Paris under the name of Chasselas de Fontainebleau. It is true, that last year I thought I had discovered an anomaly in the grape. I found a fine shoot filled with fruit growing apparently out of the side of an old branch as big as a man's wrist. I deemed it so strange that I was upon the point of asking some friends to come and see it, but upon examining it more closely I found that there had been a shoot there the year before, and which the gardener intended to extirpate but did not rub off the buds at its base. It is these buds, scarcely visible, which furnish the fruit at Thomery.

THE ISABELLA GRAPE.

This is now perfectly ripe in my garden, its maturity having been accelerated by girdling. It is larger, its skin and pulp more tender, and its juice more abundant and sweeter than that of our wild fox grape—but it has the very peculiar flavor of that grape so strongly, that I am persuaded it is only a variety of it. Its skin, if retained too long, or pressed too hard in the mouth, leaves the same unpleasant flavor as the fox grape does. To those who cannot (from want of skill) raise the European grape, it may be valuable; and if a serious effort shall be made to make wine in New-England, I think the Isabella offers the fairest prospect of success. It is a very vigorous plant and a great bearer.

For the table, however, even the little cluster grape, called the Miller grape, the least valuable of all the imported grapes, is, in my judgment, preferable to it.

We continue our selections from the invaluable *Hints to American Husbandmen*, published by the Pennsylvania Agricultural Society.

On Orchard Grass—Manner of cultivation—securing the seeds—Quantity sown—Season and mode—Causes of failure—Product and value for pasturage and hay—its nutritive qualities, and superiority over timothy, both when green and dry.

BY LOYD JONES, ESQ.

Montgomery County, (Pennsylvania,)
February 3, 1847.

DEAR SIR,—I have cultivated orchard grass for five and twenty years. My crops failed from the bad quality of the seeds, until they were secured by myself. When they are in the state at which they can be shaken from the heads, the stems are cut by a skillful cradler just above the tops of the under grass. After some practice, he is enabled to catch with his left hand the portions taken by the cradle, and to place them regularly as he advances. They are immediately bound in sheaves large as a man's leg. Double swaths are afterwards mown with a naked scythe to remove the

under grass, and leave at proper distances throughout the field, openings upon which the sheaves are shocked. They remain in this state from eight to ten days, until sufficiently dry to be carried to the barn, where they are forthwith thrashed to guard against heating, the great source of injury to the seeds of this valuable crop. The usual manner of securing them, by putting the sheaves into the mow, is, I am satisfied, the most effectual mode to destroy the principle of vegetation, as they can rarely be so treated, without being cow-burned.

After having been thrashed, they should be strowed upon the barn floor—occasionally stirred, if the quantity be large, during eight or ten days, until they are perfectly dry—without this precaution they would inevitably be heated.

The under grass should all be mown for hay, as soon as possible, after the seeds have been harvested. If it be allowed to stand but for a few days, it loses its nutritive properties—in fact dies, after having lost the heads. The hay thus made, and properly secured, although necessarily harsh from having been allowed to pass the stage of its growth when most succulent and nutritious, I have found good fodder, for both horses and neat cattle.

The product of seeds varies from ten to twenty bushels per acre. I have had in a very favorable season, twenty bushels upon land which would not have afforded, I think, ten of wheat. The product of this, as of all crops, depends much, of course, upon the season, and the preparation of the land. The crop to which I advert, was purposely grown upon a poor soil, to show the excellence of the plant, and the fallacy of the assertion that it required very rich land.

I sow from eight to ten quarts of clover seeds, and a bushel of orchard grass seeds per acre in February, upon wheat or rye land. I should prefer their being sown with oats or barley, as the seeds could be covered more regularly with the harrow, and their vegetation would be secured.—I do not apprehend injury from frost in early sowing, but I dread the effects of drought from late. I have never suffered from early, but have generally had cause to regret the evils of late sowing.

I consider orchard grass the best herbage for pasturing upon *upland*—for hay it certainly cannot be excelled.

I cultivated timothy for many years. As pasturage it is utterly worthless after the first of July, upon *upland*. Timothy hay is valuable for turf horses, and those used in quick draught; but for the purposes of farmers I think it should not be raised. I have long since discontinued its growth. It is a great exhauster, and should never be cultivated, unless it can be carted to market, and be replaced by large supplies of manure.

I am, very obediently, &c.

LOYD JONES.

JOHN HARE POWEL, ESQ.
Powelton.

On Grasses; Orchard or Cocksfoot; Timothy and Red Top, or Herds-grass; their comparative values for Pasturage and Hay.

BY JOHN HARE POWEL, ESQ.

Powelton, February 10, 1847.

In presenting Mr Jones' communication, it is not necessary that I should advert to his accuracy and reputation as a farmer, with which you are sufficiently acquainted, to receive his opinions and

statements, with implicit reliance upon their validity and force. He is the most successful cultivator of orchard grass, with whose practice I have become acquainted in any part of the United States.

As he has detailed his mode of securing the seeds, I may be allowed to state, that I have for several years induced him to send large quantities of them to my agricultural friends, whose experience, in confirmation of my impressions, that when properly treated they seldom fail, establishes the correctness of his management in collecting them.

I have before brought to your notice the extraordinary product of cocksfoot or orchard grass as pasturage upon *strong* soils: its early appearance in the Spring; its vigorous and rapid growth throughout the Summer and Autumn, abounding even in December, the most succulent and nutritive herbage I have in this climate seen.

Of timothy as pasturage, I have had during twenty years, opinions similar to those conveyed by Mr Jones.

On highly manured, or deep alluvial soils, it produces greater crops of hay, than any grass I have grown, except red clover. Mr Welles, of Boston, a few years since obtained four tons of timothy hay per acre, from a large field. His well known precision, independent of the ample proofs he adduced, sufficiently establishes the fact.—When allowed to become *mature*, I think it causes as much exhaustion as a crop of Spring barley or oats. And so far from land becoming better, whilst exposed to the effects of the scythe, and the rays of the sun in a regular course, wherein timothy is introduced as the meliorating crop, I am led to believe that it is made worse. If timothy be depastured after the first crop has been taken, I apprehend that, as its after growth is extremely feeble, in this climate, the sun must have great effect upon the soil, throughout the hottest season of the year.

Red-top or herds-grass has recently been brought more into notice, and it will, I have no doubt, be extensively cultivated, when it shall have been better known. We see it generally upon the reclaimed marsh lands of an adjacent state, where perhaps its extraordinary hardiness and large product, even under the most slovenly management may have retarded to a certain extent, the improvement of the district in which it is principally grown. It will flourish where no other grass, which we cultivate, can live. Its apparent qualities, and the quantity of nutritive matter, are no doubt very much influenced by the state of the land upon which it is produced; hence when offered in the market in competition with the produce of the most highly cultivated *upland*—it is condemned. The seeds of this grass, as those of cocksfoot, are rarely brought to the shops in a sound state—they, as the former, are surrounded by chaff, which, if closely examined, will be found frequently to envelope shrivelled kernels, and to be infested with some of the most noxious weeds with which a farmer can contend.

Upon a small piece of land which had been occupied by Swedish turnips, and had been carefully tilled for many seasons in succession, two bushels of herds-grass seed per acre, in addition to the usual quantity of clover and timothy seeds, were sown with Persian barley in the Spring of 1820. A much larger piece was sown at the same time with timothy alone. The timothy soon dis-

appeared from both—the clover of course long since *went out*—the herds-grass has formed a tough and valuable sward.

Upon arable farms it is sometimes troublesome, as it is tenacious of life as blue grass. Its product is not generally leavy upon such lands, and I should not therefore cultivate it with a regular course of white crops, although upon a grazing farm, or upon some large southern domains, where it would be well that the landholders should forget half their possessions, it might be expedient to cultivate it largely and obviate the necessity of indulging the fattening bullocks with a regular ramble for the solace of their stomachs, throughout some hundred acres of growing Indian corn. The herds grass has the great merit of being able to take care of itself.

I have the honor to be, &c.

JOHN HARE POWELL.

Pres. of the Penn. Agric. Society.

ITEMS,

Selected from the Transactions of the London Horticultural Society.

To preserve the Golden Pippin and other Apples free from Canker.—John William, Esq. of Pitwaters, believes, and to a certain extent has proved, that this may be done, by every year pruning away as much of each shoot of young wood as is not perfectly ripened. He has practised this for six years, and has now a fine young dwarf golden pippin tree, as perfectly free from canker as any new variety. The best stock for the golden pippin he finds to be the Siberian crab, because, as the shoots of this crab cease to elongate after the month of August, the roots become less active in propelling the upward sap; hence the wood and buds of the graft are more perfectly ripened in the autumn. We are very happy to learn the result of this experiment, believing as we do, that the canker in the golden pippin, or any other fruit tree, has nothing at all to do with the age of the variety, and believing also that the golden pippin or any other variety, however old or diseased, may, by proper, or say the best, treatment, be reinvigorated and perpetuated in as good a state as it ever was, for an unlimited period. We have seen too many cankered trees of recently originated sorts, and a sufficient number of healthy golden pippins, to be able to be of a different opinion.

For washing the Branches of Fruit Trees for the purpose of destroying the Insects which harbour on them.—John Braddick, Esq. mixes one pound of brimstone in three gallons of gas liquor, adding soft soap to make the liquid adhesive.—The mixture is made over a fire in March, and the trees completely washed about the same time.

Dovetail grafting, by which is meant a mode of preparing the scion as carpenters prepare a tenon, and cutting the bark and soft wood of the stock in the manner of a dovetail groove for the reception of this tenon, is recommended for grafting the large branches of old trees, by Mr E. Malou, gardener to George Foljambe, Esq. of Osberton House, in Nottinghamshire.

Orange and Lemon Trees in Italy, according to Mr Shea, gardener to Lord Burghersh, at Florence, are manured with kilndried lupines, goat's dung, and stable manure; they are much watered in summer, shifted every fourth or fifth year, and preserved during winter in sheds, the apertures of which are only closed during frosty weather.

Nuts are kept till nuts come again, by A. B. Lambert, Esq. in brown earthenware pans, buried deep in a dry part of the garden.

Pears, grafted on Mullar Stocks, are found by Capt. Peter Rainier, R. N. to become more juicy, and not inferior in flavour. They grow vigorously, fruit the second year, and bear abundantly. Some are much altered in appearance; the Jargonelle remains nearly green when ripe, and is a much shorter fruit than when produced from a Pear or Quince stock.

Notice of the Siberian Bittersweet, a new and valuable Cider Apple. By Thomas Andrew Knight, Esq. F. R. S. P. H. S. &c.

Raised "from a seed of the Golden Harvey Apple, and pollen of the yellow Siberian Crab," and we have no doubt it is what it is said to be "new and valuable." The following merits, however, are surely too great for practical credence: "The American bug wholly avoids the trees. I have frequently inserted grafts into stocks, upon which these insects abounded, and upon which they had continued to abound; but I never saw more than one instance in which they were found upon the graft, and then it was just above its junction with the stock, and three days afterwards they had entirely disappeared." We have not a doubt that this statement is perfectly correct in regard to the individual plants in question, but to infer from it that the Siberian bittersweet is much, or at all less obnoxious to the attacks of the American bug than any other variety of apple, we think inconsistent with experience in regard to this insect, and we are sure that to leave such an inference open to be drawn, is calculated to deceive the amateur, and might injure the practical gardener. We could produce cases of both from papers of Mr Knight's, (e. g. the pine-apple,) but we know that a hint to our excellent and much esteemed president will be sufficient. The truth is, that without that ardour and imagination which leads a man to push any favorite idea as far as it will go, Mr Knight could never have accomplished for horticulture so much as he has done. It is impossible to be often original and right, without being sometimes extravagant and wrong.

An Account of Ten Varieties of Persian Melons. By Mr John Lindley, F. L. S. Assistant Secretary for the Garden. Read September 19, 1826.

Persian melons are distinguished by a thin and delicate skin, and tender, rich, and sweet juicy flesh; but their cultivation is more difficult than that of the melons of Europe. They are grown in Persia in open fields, on beds richly manured with pigeon's dung, and irrigated by intervening channels supplied artificially. The most successful attempt at imitating this state of things "seems to be, to supply the plants abundantly with water at the roots, but to give them as little as possible over head, to combine copious ventilation and high temperature, by means of frequently renewed linings of hot dung; and to elevate each fruit a few inches above the soil, by means of a slate laid upon two bricks placed side by side."

Of the sorts described, a few are of doubtful merit; and "it has been lately understood from Mr Willcock, that some of the kinds now described are winter melons, which require keeping for some months before they are fit for table; a circumstance with which we were not made acquainted in sufficient time to ascertain which of

the varieties now about to be mentioned are of that description." It would not be of much use, therefore, to repeat the names of fruits of which we do not even know the season of their ripening.

The Horticultural Society and the public are much indebted to Mr Willcock, the British envoy at the court of Persia, for his unceasing exertion in attempting to transfer several of the rare productions of that country to England.

A correspondent in the neighborhood of Doncaster informs us, that he sows the common green beet three times a year, exactly in the same way as he does spinach, and has a perpetual supply of an excellent substitute for that vegetable. By cutting the leaves when quite young, they are as tender, even during the hottest period of summer, as those of the common spinach are in spring and autumn. A perennial spinach, however, whether from the *Beta maritima*, or *Chenopodium Bonus Henriens*, is very desirable in every garden, as a resource in case of neglect or accident, and because the plants, being in perpetual maturity, and abundantly furnished with proper sap, are, as it were, even on the alert to take advantage of any circumstances favourable to vegetation.—*London.*

UPPER CANADA.

The laying of the corner stones of the Seminary and some of the public edifices at Guelph, in Upper Canada, was celebrated with much festivity. Upwards of 300 persons dined together on the occasion. In the evening there was another and a smaller dinner, at which Mr Galt (the novelist and poet) presided. This new settlement is making a very rapid progress. They have already formed an "Agricultural Society." Of the town itself a Canada paper says:

"The town itself is very pleasantly and advantageously situated. The streets radiate from the centre of the public square, which is laid out near a bend of the river. The large House, or Caravansara, is situate on this square, and is a very handsome and commodious building, containing a large hall, a kitchen in one wing, and a bar room in the other—an office for the company's use, and eight or ten bed rooms, all on the ground floor, besides the upper apartment. The two public buildings now erecting, are in front of the house above described, on the right and left of the principal street. The Market House stands on the main street at the entrance into the town, from the Waterloo road, and is a neat building, and sufficiently commodious for a town of 3 or 4000 inhabitants. Besides these buildings, there are nearly thirty dwelling houses, stores, &c. either of squared logs or frame; all completed, or nearly so; and a great many more, including a church or two, will shortly be erected."

Extraordinary Despatch.—A gentleman in this city received a letter from his friend travelling in Europe, by the ship Henry Fourth, dated at Berlin, in Prussia, the 6th of August last; that is in 37 days. We have never before heard, of such a rapid transmission of intelligence from such a distance in the interior of Europe. [N. Y. Dai. Adv.]

The dog mentioned in our last paper as suspected of madness, has since died. That he was mad, is beyond doubt. He bit a number of dogs, hogs, and four or five persons. We believe the latter are all using the scull caps as a preventive of the effects. [Doughkeepsie Telegraph.]

ADDRESS.

Extracts from an Address delivered before the Hartford County Agricultural Society, October 12, 1835. *Copyrighted by p. 38.*

BY REV. CHARLES A. GOODRICH

A third point upon which I would insist, is the importance of a still *higher cultivation of our farms*. It is not an uncommon complaint among farmers "that the times are hard." Is it wonderful that with some they are so? They are "hard" because their crops are small, and their crops are small, because they fail to bestow the proper cultivation upon them. Concentrated action is efficient action; and it is this only which gives large agricultural results. But to this an obstacle presents itself nearly insurmountable. Our farms are in general too extensive, and the labor of the farmer is spread over too extended a surface. And yet, instead of selling a single acre, most of our farmers covet many more. If farmers, however, would thrive, they must change their policy; they must concentrate their labour; they must give to a few acres the care, now usually bestowed on many; and if necessary to this, they must diminish their farms. Many an acre of corn, and many of rye now yield only 10 or 12 bushels, and even less. Many an acre is mowed, whose burden—if it may be called a burden—amounts to scarcely half a ton. How much wiser—how much more grateful, to give to these acres a proper cultivation and gather bushels for pecks, and nearer tons for hundreds! This, I conceive, is, at present, the great error of our farmers generally. They adopt a diffusive, desultory mode of operation, which keeps their lands poor, and themselves poor also. The only method by which the benefits of a thrifty, productive husbandry can be enjoyed, is to change the present system for one more compressed and more vigorous. It should be written on every farm house, and in the centre of every lot, as a memento to its occupier—*"Till but little, and till thoroughly."*

To an efficient cultivation of a farm, two things appear to be particularly important—a *proper rotation of crops, and a sufficient and proper application of manures*.

In respect to a rotation of crops, it may be observed, that every soil is better adapted to some kinds of plants than to others; yet it possesses, it is apparent, but in a limited degree, the ingredients, which render it most suitable to these plants. Hence, if it be pursued with these plants but for a few years in succession, the soil becomes exhausted, leaving the land incapable of bearing good crops of a similar kind. But the same land possesses other ingredients adapted to produce plants of a different kind. Now, what more philosophical than to stop short of the point of exhaustion in respect to the *first* crop, and to apply a *second* of a different kind, to be followed by a *third*, a *fourth*, a *fifth*, and even a *sixth*, if necessary, until the partially exhausted powers of the soil in respect to the first crop be restored, by acquiring the ingredients essential to its production, by the decomposition of vegetable matter. In this way, the productive energies of the land may be preserved to a great extent, without the application of manures; and with them, may be raised to an indefinite extent.

Let the farmer learn the importance of greater attention to the accumulation of manures. Let him learn, that when he takes a crop from his field, be it grass, or be it grain, just so much virtue is subtracted from the soil, and just so much must, in

some way, be returned to it, ere its productive powers will be as before. And, let him be as solicitous too to *restore*, as to *take*, if he wish not to steal from himself, and thus lay the foundation for the permanent injury of his farm. In older countries, where the population is more dense, and consequently a greater quantity of food is necessary, more economy in the accumulation of manure is observed. "Even house sweepings, the dust or powder of bones, farrier's and clothier's clippings, refuse of manufactured skins, shavings and turnings of horn, hair, woollen rags, and many other like substances, are carefully saved, and sold to farmers." In this country, necessity does not yet compel us to resort to such means, nor does *economy* demand it. On every side, materials of better quality abound. In the accumulation of manures, however, the farmer should have reference to the nature of the soil, for which his application is intended. If the soil be sandy, let his yard, or compost heap, receive a due proportion of clay, loam, marl or peat; if the soil be clayey, let him cart into his yard sand, lime, and such other substances as will render the soil more light and loose."

In respect to the *application of manures*, whether in a *fermented or unfermented* state, much difference of opinion has existed. We have high authority, now, however, for believing, that "rotten manure," or that in which the fermentation is past, is inferior in virtue, and less applicable, particularly to tillage crops. In the process of fermentation, much of the volatile and most valuable part escapes; whereas, were the manure ploughed in, and the fermentation carried on beneath the soil, this would be saved. Another disadvantage in applying fermented, or rotten manure is, the loss of heat, which, if produced in the soil, would accelerate the germination of the seed, and nourish the plant, in its incipient and most critical state. Sir Humphrey Davy who has treated this subject with much observation and science, is of the opinion that in the process of fermentation, manures lose, from one half to two thirds their weight. In this opinion, Mr. Young, who received the medal of the Bath Agricultural Society in England, for his essay on manures, and Mr. Coke, a distinguished agriculturalist in that country, concur. Hence, the importance to every farmer of a stercorary, or shed, under which he may house his manure, to prevent fermentation and evaporation. Hence, also, manures, which are carried into the field in autumn, should be laid in large heaps, and carefully covered with earth. This will check fermentation, and prevent the escape of the carbonic acid and ammonia, two most valuable sources of nourishment to the vegetable world. To test the value of the volatile part of manure, Sir H. Davy inserted the beak of a retort, filled with unfermented manure, among the roots of some grass, on the border of a garden. In a few days, the anticipated effect was apparent; this grass assumed a most luxuriant growth; yet it will be observed that from this manure it had received only the volatile part, no other being able to pass over. If this principle be correct, the practice of many of our farmers of getting out their manures in the spring, a month or two before they plough it in, is incorrect. Here exposed to the heat of the sun and to the wind it has, until it is scarcely susceptible of being spread. *As little time as practicable should intervene, between carting it to the field and burying it in the soil.*

Another subject worthy of more notice than can be here given to it, is the importance of an increased attention to the *cultivation of some of the choicer kinds of fruit*.

Fruit of various sorts, indeed, abounds; but I need not say that most of it is of a very inferior kind—without deliciousness to the taste, and greatly obnoxious to health. Few things add more to the beauty of a farmer's residence, and nothing, surely, of this nature more to the comfort and pleasure of a family circle, than an enclosure of good fruit. Yet among farmers, and, indeed, amongst most classes of society, this source of honest joy has been culpably neglected. The varieties of excellent fruit within our reach are numerous, and at the reasonable prices at which they are afforded at our nurseries, few are so poor, that they cannot purchase sufficient to adorn and enrich their yards. To such as may be desirous of making a *small* selection, I would recommend as among the best—of *Peaches*, the Anne, or Early Ann, the Noblesse, the Old Newington, the Yellow Rare Ripe, the Green Catharine, the Red Cheek Melacaton, the Lemon Clingstone and the York Rare Ripe;—of *Apples*, I would mention the Early Harvest, Early Bough, Nonpareil, Newtown Pippin, Spitzenberg, Roxbury Russeting, Rhode-Island Greening, and the Baldwin Apple;—of *Pears*, the Jargonelle, St. Germain, Chamaoutelle, Skinless, Vergaloo, Bon Cretien, or Goud Christian, and the Seckle;—and of *Cherries*, the Black Tartarian, Ronald's Black Heart, May Duke, White Heart, and Yellow Spanish. These are but a *few* of the many excellent varieties which have been found to flourish on our soil. But, were a farmer about to advertise his place for sale, and could he only add that *these* varieties of fruit would be found upon it, would he not expect an addition to the price for the farm, many times exceeding the cost of the trees, and the value of the labour of rearing them? If our farmers then would add beauty and value to their farms, let them betake themselves to the cultivation of a good selection of fruit trees.

With little more than an allusion to another subject, I will relieve your patience—I mean the *want of attention to neatness and order about many of our farm houses*.

New-England has many points of advantage; but in respect to neatness and order about her villages and farms, she contrasts badly with other countries. Englishmen who visit us are disgusted with the appearance of our villages, for in their own land, they are accustomed to see them adorned by the hand of system and taste.

Let us look to this point then. Neatness and order are enjoined not only by economy, but by comfort. Every slovenly farmer resigns one of the choicest pleasures within his reach, that of seeing his house and home surrounded by the marks of neatness, industry, and taste. He brings up his family amidst confusion, and presents to his children an example of negligence the most unpardonable. Can he wonder if they follow this example? They will go further.—In their very partialities they will have a vicious preference for what just taste, good sense and sound economy condemn. They will regard with less respect the decencies of life, and be more likely to abandon the paths of virtue and morality. There is much meaning in the old adage, and the observance of which, let me urge as a remedy for

every degree of the evil I advert to—"Have a place for every thing, and keep every thing in its place." In the language of a venerated man, now gone to a better world—

Let order o'er your time preside,
And *method* of all your business guide.
One thing at once, be still begun,
Contrived, resolved, pursued and done
Ne'er till to-morrow's light delay,
What might as well be done to-day.
Neat be your barns; your houses neat
Your doors be clean; your court-yards sweet
Neat be your barns; 'tis long cowled,
The *bold*'s farmers are the best.

From the Worcester Freeman.

PLASTER OF PARIS.

MR. EDITOR,—Having finished my hay harvest, and allowed myself some little respite from the toil and fatigues of a long season and plentiful crop, I am induced to give you the result of an experiment, made with Plaster of Paris, on a field of clover. But peradventure some previous account of the "ground plat" may be necessary.

The lot contains about four acres, of deep soil, of what would generally be termed a dark mould or loam, is situate on the northwestern portion of a considerable hill, reaching from the summit, where the fences cut each other at right angles, to the base, and much resembles the form of an open fan. This lot, until 1823, had not been ploughed for more than thirty years—for its former owners had considered it too steep for cultivation, its medium rise being about five degrees; but this was my next lot in course, and in June of that year I made my first experiment with Wood's patent plough, to "break up" this side-hill pasture, for a crop of rye. In September following, the rye was sown. In 1824, after reaping a tolerable crop of rye, and drawing rocks sufficient from the field to make a wall the whole length of the south line, I turned in the stubble, taking care to run the furrows, horizontally, to prevent its washing. I planted it with corn the next season, using from ten to twelve cart-loads of manure, from the barn-yard and hog-pen to the acre, put in the hill. The corn yielded but indifferently, but about twenty bushels to the acre. In April, 1825, the ground was prepared and sown with oats, which were ploughed in: after which the grass-seed, viz. one peck of herds-grass and four lbs. clover-seed to the acre, was sown upon the furrows, in two directions of the field, crossing each other in order to lay the seed even, and then harrowed down with a heavy bush-harrow. About one bushel to the acre of plaster was then cast over the field, and left until harvest, when a most plentiful crop of oats was gathered, and the young clover, notwithstanding the extreme drought which prevailed, appeared on most of the fields in luxurious abundance. Last spring, while most people were ploughing up, or pasturing the grounds they had stocked down the year before, this clover presented a beautiful prospect, and in July reared to me as large a crop as is ever desirable—having a small intermixture of herds-grass, say about one tenth part. That the plaster was the principal agent in producing this crop, I am morally certain, from several reasons. There were narrow strips, several rods in length, where the plaster did not strike, that bore no grass at all. My neighbour had cultivated a field adjoining this on the south, with the same succession of crops, and managed in a similar manner, saving the use of

plaster, and his field shows nothing but a sorry crop of sorrel.

I don't claim to have made any new discovery in the present instance, because others, to my knowledge, have made the experiment with equal success; but it is a fact of no small importance to the agricultural interest; and while I am comforting myself with having, by the process above described, converted a barren cow-pasture, which produced little else than mouse-car, pennyroyal and hard-hack, into a productive mowing lot, I am desirous that the fact should be more generally known.

A FARMER.

Worcester, August, 1827.

CULTURE OF RICE.

A committee of the Savannah City Council, called the committee of Dry Culture, has made a report to show the beneficial effects on the health of the city from the prohibition of the culture of Rice. To show the improved state of the health of the city within the last ten years, they have published a table of the deaths in each year.—They estimate the average number of white inhabitants to have been 5000. The number of deaths of whites in the last ten years, as shown by the table, is 3,421. The number of deaths in 1817, was equal to 1 in 11 of the whole white population. In 1819, 1 in 10, and in 1820, 1 in 7. For the three last years the mortality has been much less, viz. 1 in 34, 1 in 40, and 1 in 21.

CAPE OF GOOD HOPE.

This important British (formerly Dutch) Colony in Africa is becoming populous and powerful, and may in time form an independent state. The population consists of 50,000 whites, (British and Dutch) and 30,000 Hottentots. The British settlers raise barley, Indian corn, potatoes, and other vegetables, and possess large herds of cattle.—The Dutch farmers, called Boors, follow the beaten track of their ancestors, and care nothing about the culture of the mind. They are seated on large tracts of land, frequently of 4, 5, or 6000 acres each, and some of them possess 10,000 sheep and goats, and 1200 or 1500 head of cattle.—Many of them are destitute of huts, and live entirely in wagons; they are unpolished and rude, but kind and hospitable.—*Hampshire Gaz.*

PAWTUNET FAIR.

On Wednesday and Thursday the 3d and 4th of October, the annual Fair of the Rhode Island Society for the Encouragement of Domestic Industry will be holden at Pawtuxet. The premiums offered for the best productions in agricultural and manufacturing industry are numerous and well allotted, and we hope the competitors for them will be on the spot betimes and will be both numerous and zealous. It has not yet been announced who is to be the orator on this occasion.

Profr. Journal.

CHEESE AND WOOL.

It is a fact that notwithstanding the unparalleled drowth of the last season there was not much less than 500,000 lbs. too much Cheese made for the consumption of our market. If that was the case last season, I ask, how will it turn out this season? Many who kept sheep last year now keep cows, and those engaged in making cheese last year, have increased their dairy in consequence of the high price cheese brought last seas-

on; and then we must add from 5 to 10,000,000 pounds, that is expected from the young state of Ohio (by the way of the western canal,) more than ever came to our markets before. Hence it is obvious that the people of this country must pursue a new course of "political economy" and give sufficient encouragement to the growers and manufacturers of wool to enable us to supply ourselves with our own wools—and not mortgage to England our lands for this necessary and important article which can be manufactured and the raw material raised here of as good quality and as cheap in a short time as in any country.

The Governments of Europe exclude the importation of every article of produce that they can any way furnish within themselves; and the time has arrived when this country must furnish within itself every necessary in her power, or the country is ruined.—*Litchfield County Post.*

INTERESTING TABLE.

MR. EDITOR.—The following is taken from a late English paper, with the exception of the prices in some of the American markets, which I have added and are believed to be correct. The statement is further altered by being adapted to our measure and currency.

PIKE.

Prices of Wheat per bushel of 60 lbs. in various parts of the world, in May and June, 1827:

AMERICA.

Norfolk, Va. May.	—\$1 16 cents.
New-York, June, 20,	90 —
Montreal, Ca. June,	90 —
Cincinnati, Ohio, June,	50 —
Pittsburgh, Penn. June,	44 —

NORTH OF EUROPE.

London, June, 20,	—\$1 79 cents
Antwerp, May 30,	1 21 —
Hamburg, May 25,	87 —
Bremen, May 25,	81 —
Danzic, May 25,	76 —
Stettin, June 15,	73 —
Copenhagen, May 31,	72 —

SOUTH OF EUROPE.

Nice, June 15,	—\$1 31 cents
Milan, May 31,	1 27 —
Santander, Spain, May,	1 26 —
France, June 30,	1 17 —
Genoa, May 26,	1 05 —
Leghorn, May 31,	1 03 —
Civita Vecchia May 31,	90 —
Naples, May, 31,	88 —
Trieste, June 15,	83 —
Odessa on the Black	—
Sea, May,	49 —

[N. Y. Nat. Adv.]

CURE FOR THE EPILEPSY.

Lately, a woman passing through the streets of Glasgow, was suddenly attacked with a fit of epilepsy. Among the persons attracted to the spot, was a young sailor, who, on seeing the woman, called out for some grams of coarse salt, which he forced into her mouth. This immediately had the effect of restoring the woman's sensation and speech, and her convulsion was at once put a stop to. The young man, who had been at Madagascar and other foreign places, says he has seen this remedy applied in epilepsy with great success.

Four hundred and fifty excellent Bass, weighing 2700 lbs. were lately caught at one draught, at a fishery near Saco

(Selected for the American Farmer.)

SALT AND ALCOHOL.

"Salt and Alcohol appear to owe their property of preserving animal and vegetable substances to their attraction for water, by which they prevent its decomposing action, and likewise to their excluding air. The use of ice in preserving animal substances is owing to its keeping their temperature low." [Davy.]

TO DESTROY THE THISTLE.

"It is frequently cut close above the ground, by means of a very simple instrument called a weed-hook; but it is done more effectually by means of a pair of forceps or nippers with two long handles, by which the whole or a part of the roots are pulled up, and the plants destroyed or much weakened." [Sinclair.]

DOCKS.

"Docks should be pulled up by hand, after heavy rains, when the soil is soft enough to allow those long tap roots to be easily pulled without breaking, and before the seeds approach ripeness." [Ibid.]

WEEDS INCLUE

"All plants that grow naturally among a crop that has been sown; or in other words, all those which are enemies to the crop cultivated may be regarded as weeds." [Ibid.]

WEEDING ENFORCED BY LAW.

"The importance of weeding, is such, both to the individual and to the public, that it ought to be enforced by law. At any rate, a regulation of police, for fining those who harbour weeds, the seeds of which may be blown into their neighbour's ground, can have no injustice in principle." [Ibid.]

IMPORTANCE OF AGRICULTURAL IMPROVEMENT.

"The improvement of agriculture is ever a matter of the greatest consequence, as well to each particular country, as to mankind in general. It is peculiarly important to us, as a commercial nation; the support of our trade depending on our manufactures; those manufactures on the rate of labour, and the price of labour, in a great degree, on the price of the necessaries of life." [Dossie.]

SHEEP IN ENGLAND AND WALES.

"The number of sheep in England and Wales, according to the evidence given on passing the last (1800) wool bill, exceed 40 millions; of which, including three millions of lambs, about fifteen millions are killed annually. The yearly clip of wool is about 144,000,000 pounds, which (at the price of 10d per pound) sells at six millions sterling. About 600 sheep and lambs die of the rot or otherwise carrion." [Agricultural Magazine.]

ADAM'S APPLE.

"Adam's apple is the fruit of the Citrus Decumanus, Linn.—and in the opinion of the Jews, the same fruit which was eaten by our first parents, in transgression of the divine command; for which reason they consume large quantities of it during the feast of tabernacles." [Ibid.]

METHOD OF PRESERVING CREAM.

"Take 12 ounces of white sugar, and dissolve it in water, over a moderate fire. After the sugar is dissolved, boil it for about two minutes in an earthen vessel; after which, add immediately 12 ounces of fresh cream, and mix the whole uniformly over the fire; then suffer it to cool; pour it into a quart

bottle and cork it carefully—keep it in a cool place, and it will continue fit for use for several weeks, and even months." [Ibid.]

AGRICULTURE AND RURAL ECONOMY.

"Unless for the improvement of agriculture and rural economy, several of the most useful and interesting branches of physical science, such as chemistry, botany, mineralogy, zoology, would scarcely deserve to be cultivated." [New Farmer's Calendar.]

WHEN AND WHERE WAS BEER FIRST BREWED?

"It was first brewed by the ancient Egyptians, before the Grecian conquest of Egypt. It was, therefore, natural for them to contrive to extract from their grain, since they had no vines, a fermentable, exhilarating and intoxicating liquor—a substitute for wine." [Phillips.]

DRILLING.

"It gratified us much to find Toll so honorably mentioned as the father of that practice (drilling.) Though we have perused Toll's work as often as it merits, we were not aware that he laboured under any pecuniary difficulties; and it is with regret we find that we must add his name to the illustrious catalogue of those who have benefited an ungrateful world to their own detriment. Our own opinion of drill husbandry would have been recited in few words. That considered simply as planting corn in lines, it is frivolous. With the assistance of hand hoeing, something better; but on the original Tullian plan, with the full benefit of horse hoeing, the most important discovery since the time of Ceres and Triptolemus." [Review of the New Farmer's Calendar.]

Patents for new inventions issued in England from the 24th of April to the 10th of May.—For improvements in machinery, for pressing cardings from woollen or carding engines, and for drawing, stubbing, and spinning wool and cotton.—For improvements in weaving machinery.—For improvement in refining sugar.—For a detached alarm watch.—For improvements on chairs, or machines calculated to increase ease and comfort.—For improvements in bedsteads.—In furnaces for smelting.—In the manufacture of brushes, and materials applicable thereto.—For a machine for ascertaining the attendance to duty of any watchman, or other persons; also applicable to other purposes.—For improvements communicated from abroad in the rectification of spirits.—For a composition or substance, which may be moulded into bricks or blocks for building; and also made applicable to ornamental architecture.—For an improved carriage wheel.—For a new or improved machine for the dibbling of grain.

EMIGRATION.

A vast number of passengers offered themselves that could not be taken. Many of the passengers by the Camillus have been sent for the express purpose of being engaged in the rising manufactures of the United States. We learn that great exertions have been made in New-York and its vicinity, to establish what is termed the Paisley line of manufactures—viz: shawls and trimmings, and scarcely a vessel has left the Clyde for New-York these some months by-past, but either carried out people or materials for this branch of weaving; and we understand that some of the passengers gone out in the Camillus are engaged

to assist in this manufacture. Materials for making several harnesses have also been sent out in her. We also learn, that men conversant in calico printing have also gone out in this vessel, to assist Jonathan in this branch of business. Very few passengers are going to Canada by the fall vessels, in fact, the tide of emigration seems to be fairly set in for the United States. [Glasgow paper.]

Solid Hints.—When I see a young man, the nature of whose business impudently demands all his attention, loitering about public houses, spending his time and money, and what is of much, it not more consequence, his respectable standing in society, than I say to myself, if he does not "tack ship he will be on a lee shore, and consequently among the breakers."

When I see young married persons launching out into great extravagancies, beyond what their pecuniary affairs will admit, then I say to myself you had better "haul aft, and run closer to the wind, or you will soon have to make a losing stretch to get to windward again."

When I see parents indulging their children in every thing their little fancies prompt them to desire after, then I say to myself, your children will soon be your masters, and it is probable, should they come to years of maturity, will be a cause of trouble to you in old age, and by their improper conduct, bring down your grey hairs with sorrow to the grave." [V. Y. Ev. Post.]

NEW ENGLAND FARMER.

BOSTON, FRIDAY, SEPT. 28, 1827.

The annual meeting of the Plymouth County Agricultural Society for the choice of Officers, Exhibition, Cattle Show, &c. will be held at Bridgewater on Wednesday the 31 day of October next. The Ploughing Match will commence at nine o'clock. An Address will be delivered on the occasion, by JOHN WINSLOW WHITMAN, Esq.

A society, entitled, the New Jersey Society for the promotion of Manufactures and the Mechanic Arts, has been established in East Jersey, of which Governor Williamson is the President.

The Exhibition and Cattle Show of the Cheshire Agricultural Society, is to be held at Drewsville, N. H. on Wednesday the 31 of October.—Premiums are offered for the best Working Oxen, Cows, Bulls, Sheep, Swine, Stud Horses, Woollen and Linen Manufactures, Hats, Leather, &c.

We are happy to state that an Agricultural Society has been formed in the enterprising and wealthy town of Hingham, Mass.

The Hillsborough Cattle Show was held at Milford, on Wednesday last; but the unfavourable weather tended to dampen the exhibition. The assemblage was nevertheless numerous; and as each Member of the Society advanced to the table to contribute his quota to the objects of the Society, he received from the fair ladies, of Ladies appointed for the purpose, the honorary badge of the Society, furnishing the Secretary at the same time with a list of the articles he intended to compete for premiums, or wished to exhibit as specimens of neat and ingenious manufacture.—This pleasing arrangement could not fail to pro-

duce cheerfulness and punctuality. The pens were early filled with fat and improved kine; and the lawn with large, tight-built, and strong working oxen. The display of Domestic Manufactures and Fancy Articles was also handsome, and did honor to the skill and taste of the fair daughters of the Granite State. We need not particularize. Although the storm continued on Thursday with increased violence, the trials of strength of the working oxen, and the Ploughing Match, were not omitted. The competitors on the flooded field in the latter amounted to fourteen yokes; and the spirit of numerous spectators did not deter them from witnessing the exhibition, notwithstanding they endured a storm of rain and high wind during the whole time they were in the field.—This damper to the outward man proved a stimulant to the inner one, which was amply demonstrated at the Collation table. The Hon. SAMUEL SMITH delivered an appropriate address in the meeting house on the occasion. The unfavourable weather, of course, prevented the Ladies from enjoying the out door exhibitions; but they have too much spirit and perseverance "to give out for one bad bout."

A new Agricultural Society has been formed in Windham county, Con. whose annual meeting and Show was to have been held at Pomfret on the 26th inst.

A Cow of the Durham Breed has been brought for John Hare Powel, Esq. (by Capt. Serrill) in the Tuscarora, which has just arrived at Philadelphia, from Liverpool. This animal is supposed to be one of the finest of its species that has ever been landed upon American soil.

A new line of Packets is to commence running between Boston and Liverpool, on the 1st of November. New ships are building, to be fitted up in a superior manner. It is hoped this undertaking will receive a zealous and liberal encouragement from all who wish the prosperity of this city and of New England.

A singular circumstance has lately occurred near London. On the 18th of August, an oily substance appeared in the Thames, which killed the fish, and shoals were found floating on the surface of the water. A vessel freighted with oil is conjectured to have been lost; various other conjectures as to the cause were afloat. The most plausible appears to be that which attributes it to the lees of the gas works on the river, which is shown in the oily substance which covers the water.

A work of the Duke of Saxe Weimar, who was in this country in 1825-6, consisting of a Journal and letters written during his stay amongst us, is shortly to be published.

We have been gratified with examining a microscope made by Mr Ephraim Rand, of Bedford, and which has been exhibiting in this town (probably a solar Microscope.) It magnifies objects four hundred thousand times. We believe no instrument has been made in this country, which magnifies objects more than half as many times as this does. A common fly appears to be about fifteen feet in length, and the leg of a grass hopper about twenty feet. Thousands of eyes are perceptible by means of this wonderful instrument in a common fly, and we also perceive an innumerable number of animated beings in liquids. In the

smallest grain of a fig, which we can see, we perceive a large number of living creatures.

[Dunstable, N. H. paper.]

Preservation of Dead Game.—A nobleman desires us to state that grouse and other game, when wrapped up in linen, well moistened with equal parts of the pure pyroligneous acid and water, will keep good for many days during the hottest period of autumn. His game keeper in Scotland has for the last two years adopted this mode of sending game to London, and on its arrival it is as fresh as when it was killed.—*Gazette of Health.*

The Boston and Canton Factory company imported, during five months preceeding the first of May last, one million pounds of Smyrna wool; all of which is used in its own factory, in the manufacture of what is called negro cloths.

The Cape Fear Recorder, says—By our Price Current, it appears that there is no meal in market. Bacon and lard are very scarce.

Agricultural Books.

For sale at the Farmer office, No. 22 North Market street, a variety of the most approved books on Agriculture, among which are

The Code of Agriculture; including Observations on Gardens, Orchards, Woods, and Plantations. By the Right Honorable Sir John Sinclair, Bart. Founder of the Board of Agriculture.

Treatise on the Breeding and Management of Live Stock, in which the Principles and Proceedings of the New School of Breeders are Fully and Experimentally Discussed. To which are added Directions for making Butter and Cheese, Curing Hams, Pickling Pork and Tongues, Preserving Eggs, &c. &c. in two volumes. Elucidated by eight Copper Plates, and several Engravings on Wood. By Richard Parkinson.

The New Farmer's Calendar; or Monthly Remembrancer for all kinds of Country Business; comprising all the Material Improvements in the New Husbandry, with the Management of Live Stock, By Lawrence.

The Fruit Grower's Instructor; or, a Practical Treatise on the Cultivation and Treatment of Fruit Trees; containing a Description of the Best Fruit now in Cultivation. A full description of the Apple Fly, commonly called the American Blight, which causes the Canker in Apple Trees, with an Effectual Remedy. By G. Bliss.

Cobbett's Cottage Economy. Cobbett's American Gardener. Farmer's Assistant. McMahon's Gardener. Nuttall's Introduction to Botany. Torrey's Botany. Noddy's Villa Gardener. Hayward on Horticulture. Good's Book of Nature. Hogg on the Culture of the Carnation and other Flowers. Huber on Bees. Bonner on Bees. Bakewell on Wool. Holdich's Essay on Weeds. Husbandry and Gardening, &c. &c.

Cash will be paid at this office for Nos. 35, 36, and the Index of the 5th volume of the New England Farmer.

Great Sale of Wool.

On Tuesday the 16th of October, the day preceeding the Brighton Fair, at 10 o'clock, at the Hall over the New Market, will be sold, at Public Auction, 216 bales of Saxony Wool, consisting of 1st and 2d Electoral—1st and 3d Prima Secunda—Tertia and Quarter.

100 bales Spanish Wool.
160 do. Portuguese do.
150 do. Smyrna do.

Also, 50,000 lbs. High Grade and Full Blood Fleeced Wool.

The above Sale presents a favourable opportunity to growers and holders for disposing of their Wool, which will be ready at any time on or before the 16th proximo.

Catalogues of the whole will be ready for delivery, and the Wool may be examined the day previous to the sale.

COOLIDGE, POOR & HEAD, Auc'rs.

Boston, Sept. 28, 1827.

Farnham's Improved Cider Mill.

A mill on this plan of full size is 4 feet by 2 1/2. The cylinder is 16 inches diameter and 9 inches long, the periphery fixed with points of iron or steel, placed in a spiral form, projecting 3/16ths of an inch, placed 2-2 1/2 of one eighth of an inch from each other, there being 12 rows around said block or cylinder, and 43 teeth in a row; the teeth may be 4d brads. The cylinder is put in motion by a whirl and band.

This mill without the power cost from 10 to 12 dollars; and by giving it 500 revolutions per minute it will grind or grate with one horse power sixty bushels of apples per hour; with two horses double the quantity. The apples are grated very fine without breaking the seeds.

There was rising of two thousand barrels of cider made in one of these mills last year, without expending one cent for repairs. Agents will shortly be out in the state of Massachusetts to sell out the rights of towns, counties, &c.

Apply to Joseph P. Vail, No. 213 Water Street, New York, or Joseph R. Newell, Boston.

New England Farmer's Almanack, for 1828.

Just published, at the New England Farmer Office, and for sale by BOWLES & DEARBORN, 72 Washington Street, and at the Book-store, 22 North Market Street, in New England. *Farmer's Almanack*, for 1828. By Thomas G. Fessenden, Editor of the New England Farmer.

This Almanack, in addition to the usual miscellaneous matter contained in similar works, contains a Calendar of the Courts for each state in New England; the Sun's declination; and Pages of Agricultural matter on the following subjects:—On Soaking Seed Corn in copper water—on Small Farming—on Charcoal—on Fish used as a Manure—on Gapes or Pip in Poultry—Agricultural Accounts—on Fallen Fruit—on Stagners in swine—How to raise Cabbages, which shall not be clof-fled, by Dr. Green of Mansfield, Ms.—How to Fatten Poultry—A cheap method of preventing the disagreeable smell of Privies—Foot Steamer, with a drawing—on Grated Trees—on Painting walls to Mature Pigs—on Cattle stalls—Signs of a good Farmer—on Drying Peaches—on the value of Time—Machines for gathering Clover Heads, with two illustrative engravings—Sir Asley Cooper's Chlubbain Ointment—Recipes for the Ladies containing directions for making several kinds of Cakes.—Miscellaneous.

This Almanack may be purch'd. wholesale and retail of O. D. Cooke & Son, Hartford, Con.; Holbrook & Fessenden, Braintreeborough, Vt.; Isaac Hill, Concord, N. H.—John Prentiss, Keene, N. H.—John W. Foster and Childs & Sparhawk, Portsmouth, N. H.—Pearson, Little & Robinson, Portland, Me.—Whipple & Lawrence, and John M. Ives, Salem—Ebernez Swain, Newburyport—Hill and Co., Cambridge—Ezra Culler, Plymouth—E. & G. Merriam, West Brookfield—Charleson Harris, Worcester—A. S. Beckwith, Providence—C. Thorburn & Son, No. 67 Liberty Street, New York—and by booksellers and traders generally.

Country Dealers and others supplied on the most favorable terms.

THE HUMBLE COT.

Blest be the spot where cheerful guests retire,
To pause from toil and trim their evening fire;
Blest that abode, where want and pain retire,
And every stranger finds a ready chair;
Blest be those feasts with simple plenty crown'd
Where all the ruddy family around
Laugh at the jests or pranks that never fail
Or sigh with pity at some mournful tale;
Or press the bashful stranger to his food,
And learn the luxury of doing good.

PROBABILITIES OF HUMAN LIFE.—The following table of the probabilities of human life has been given by M. de la Malle:

Table of the probabilities of human life, calculated by Domitius Ulpianus, Prime Minister to Alexander Severus, and extracted from *Emilius Macer*—

Age.	Probable future Life.
From 10 to 20 years	30 years.
10 25	28
25 30	25
30 35	22
35 40	20
40 45	18
45 50	13
50 55	9
55 60	7
60 65	5

M. de la Malle says this table was formed from the property tables, the registers of birth, puberty, manhood, death, age, sex, diseases, &c. which were kept by the Romans with the greatest exactness, from the time of Servius Tullius to that of Justinian. Ulpianus fixes thirty years as the mean duration of human life during that period. It is extraordinary that the chances of life detailed in the above table are precisely those which the registers of mortality in the city of Florence exhibit in the present day.

A child of four years old knows right from wrong as well as a person of forty; and the boy who lies at four years old, will lie when he is grown up; and it is to prevent this, that he ought to be reasoned or punished out of his fault when a child.

A young Counsel who was rather given to *bravado*, had a favorite mode of mistifying a witness by saying, "well, sir, I shall only ask you one question, and I do not care which way you answer it." Mr Brougham, who was on the same circuit, accosted his friend one morning—"well, Jones, I have but one question to ask you, and I do not care which way you answer it. How do you do to-day?"

Wild Oats.—Henry Lord Plankland having been brought into the House of Commons at a very early age, a grave Senator objected to his youth, remarking, that "he did not look as if he had sown his wild oats." His Lordship replied with great quickness, "Then I come to the properest place, where there are so many old geese to pick them up."

HABITS OF SHEEP.

Of their readiness to follow each other, even in the most imminent danger, we have a striking evidence in the case of a flock belonging to a farmer in this town. The other day one of them took

it into his head to jump into a corn-field; the others, sheep like, followed, and they were all found up to their backs in mischief.—On starting them from the field, they chose to jump over a wall, on the other side of which was a deep well. The first one leaped the wall, and brought up at the bottom of the well; and the remainder of the flock followed of course, till *eighteen* of them were snugly stowed away in the bottom of the well. With much difficulty they were taken out; though not till eight of them were drowned.—*Stonington pa.*

The best talents in the world must be known in order to be patronized. Man is a child of opportunity—circumstance either makes or mars him—but he may sometimes make circumstances. Some years ago, a young lawyer of fine talents and decent learning, and a graceful and powerful orator withal, settled in one of our western villages. He took no letters of introduction, and knew nobody. He waited in vain for clients, his abilities were unknown, and, of course unappreciated. At length he devised a plan for bringing himself into notice. He took a rattan, walked over the way to Mr Smith's store, and without saying a word astonished the unoffending Mr S. with a terrible flogging. A prosecution followed—our young lawyer made a splendid speech, showed what he was, was fined five hundred dollars, and was immediately retained in suits of great importance. He has since made a large fortune by his profession. [N. Y. Courier.]

Mad your punctation.—A person who was advertised some time since, in a Virginia paper, was described as having "a nose turned up in the middle about six feet high!!!"

Printed Woollens.—We saw on Saturday the first specimen of printing on woollen cloth, in imitation of the borders of common cashmere shawls, an establishment for the manufacture of which article is going into operation in Bloomfield, N.J. The piece we saw was a common shawl or rather coarse fabric, upon which an experiment had merely been made of the colours. They were as bright and handsome, however, as any we have observed in this important article. The gentleman who showed us the sample, it may be worth while to state, said he did not want any protecting duties.

[N. Y. Com. Advertiser.]

A Good Crop.—M. American Thayer, of Buckfield, Maine, has this season, on one acre of land, lying in this town, grown four and a quarter tons of hay!—*Paris Me. pa.*

A Barber, who was in the habit of stunning his customers' ears by the rapidity of his tongue, asked an individual one day, how he wished his beard to be cut. "Without saying a single word," replied he.

Three Irishmen wished to divide four dollars equally between them. After puzzling their brains for a long time, one of them exclaimed, "By Saint Patrick, I have hit it:—here's two for you two, and two for me too."

"You haven't *presumption* enough to succeed," said a very *calculating* Clergyman once to a young man, just entering into business for himself.—"Modesty is a commendable thing; but it will never fill your pocket, or cause you to be respect-

ed." How many find it even so! A man of blustering pretensions, without merit, modesty or worth, who will look and talk authoritatively, is generally held in greater acceptance by the world, than the person who keeps pace only with his powers, and who disdains to adopt any meretricious method for the purpose of attaining distinction.

Madness.—A commission in Lunacy was lately held in London to enquire into the sanity of a very wealthy old gentleman of high family, named *Joddrell*. One of the facts alleged in proof of his lunacy, was, that "he would sometimes begin to read a newspaper, and presently throw it down, saying it was all nonsense."

Introdution.—Two bodies, male and female, have been lately carried to England from the Canary Islands. They are supposed to have been Atlantes, and to have died 4000 years ago. Their preservation is owing to their having been disembowelled, and wrapped in bulls' hides.—*Sal. Obs.*

Fresh Garden Seeds.

For sale at the office of the New England Farmer, No. 52 North Market Street, Boston, a complete assortment of *Garden and Field* seeds, many of which are for fall sowing; a part of the seeds are of the growth of 1827; among which are

Superior WHITE PORTULACI ONION
BLACK SPANISH, or WINTER RADISH
PALL PRICKLY SPINACH, for greens
DUTCH CUCLE, for greens—WHITE MULBERRY
Various sorts of CABBAGES, PARSNIPS, CARROTS
LETTUCE, BEETS, &c. &c.

Grass Seeds.

ORCHARD GRASS, LUCERNE, HERD'S GRASS, RED TOP, RED and WHITE HONEY-SUCKLE CLOVER, &c. &c.
1 & 2 bushels fresh Canary Seed; genuine English Rape Seed; Hemp Seed, &c. for birds.

Saxony Sheep.

On THURSDAY Oct. 13. at 10 o'clock,
The day succeeding the Agricultural Fair,
At Brighton, (near Boston) the entire flock of *Electors Saxony Sheep*, imported in the ship Mentor, Capt. Mann, from Hamburg, consisting of
161 EWES and 21 RAMS.

These Sheep were carefully selected by experienced agents on account of a highly respectable House in Leipzig, and will be found to excel any that have hitherto appeared in regard to size and weight of fleece, while they are not inferior in any other particular. The large proportion of *Ewes*, of the finest quality, were not procured without much difficulty, and, in general, such measures were taken as to warrant the expectation that this flock will not suffer by the most rigid scrutiny of persons desirous to improve their stock by the introduction of *pure Saxony Blood*.

The Sheep may be examined at Brighton, at any time before the sale.

Catalogues will be ready for delivery at our office 20 days previous—when Samples of the Wool will be exhibited.

The Agent pledges himself that none of the Stock will be disposed of until the day of Auction, when they will all be sold without reserve.

COOLIDGE, POOR & HEAD.

Poal Meadow Grass.

Received this day, at the office of the New England Farmer, one cask of *Poal Meadow Grass Seed*—dry and genuine.

WANTED.—As an apprentice to the Printing Business, a energetic lad, of about 14 years of age, of good education and habits, and well recommended to such an one encouragement will be given. No other need apply.

NOTICE.—Taken up and impounded in the town pound of Newton, a brown-colored horse—the owner unknown. The owner is requested to call, pay charges, and take him away.
Newton, Sept. 11, 1827. JOSEPH WHITE, *Trial Driver*

Medical Lectures.—Boston. TIME CHANGED.

Medical Lectures of Harvard College will begin the THIRD WEDNESDAY IN OCTOBER, at the Medical College, Mason Street, Boston. The time having been changed from the THIRD WEDNESDAY IN NOVEMBER, when they formerly began.

WALTER CHANNING,
Aug. 31, 1827. 31 Doct. of the Medical Faculty.

THE FARMER is published every Friday, at \$3.00 per annum, or \$2.50 if paid in advance. Gentlemen who procure five responsible subscribers are entitled to a sixth volume gratis.

New subscribers can be furnished with the preceding numbers of the current volume.

RURAL ECONOMY.

APPLE SYRUP.

To prepare an excellent Syrup, not inferior to Molasses.—Grind a quantity of sweet apples, those, for example, known by the name of sweetings. Express the juice immediately upon their being ground, and strain it as clear as possible before fermentation has commenced. Put it into a large boiler, and boil it down to a syrup which in taste will be found to be pleasanter than common West India molasses, and as little subject to fermentation. Four gallons of rich sweet apple juice will yield one of syrup; by boiling longer, and reducing the quantity, it may be made of any consistency required.—The substance of the above we have copied from an article in the Boston Centinel for 1813.

PREPARED FRUIT.

To prepare fruit for children &c. in a more wholesome manner than putting them into pies or puddings you may take the following method: Put apples sliced, or plums, currants, gooseberries, &c. into a stone jar, and sprinkle as much loaf sugar as is necessary among them. Set the jar on a hot hearth, or in a sauce pan of water, and heat the water, and let it remain till the fruit is thoroughly done.

TO PRESERVE CUCUMBERS FOR PICKLES.

Put cucumbers immediately after gathering into a tight, clean barrel, with a sufficiency of salt, when melted, to cover them. In the same manner proceed till the barrel is filled, adding salt with every additional parcel, and keeping the cucumbers immersed in the pickle; for any suffered to float will rot immediately. When pickles are wanted for use, take a sufficient quantity, put them in a clean barrel or tub, in a cool but not in a freezing place, and pour three times the quantity of boiling water to them, and let them stand twenty-four hours. Then pour off this water and add as much more boiling hot. Proceed in the same way a third time and the cucumbers will be green, plump and hard, and fit for the vinegar and other seasoning. Be careful that boiling water, not merely warm water be used.

The above is the substance of a communication from a very respectable correspondent, published N. E. Farmer, vol. V. page 30. The writer observed that he had practised pickling cucumbers as above upwards of twenty years: and has had them ten years old, perfectly good.

It is said likewise that cucumbers may be preserved by putting them while fresh and green into a mixture of one part whiskey and three of water. See N. E. Farmer, vol. V. p. 370.

SUGAR.

A sample of sugar made last year on the plantation of Col. Henry Yonge, Gadsden county, East Florida, has been left with the editor of the Baltimore Patriot. It is a specimen of a crop of thirty barrels. The sugar appears superior to that of Louisiana in strength, though its color is not so fine as that of some of the latter, owing to its having been packed up before the molasses was sufficiently drained off. Its flavor is peculiarly deli-

cate, resembling that of candy. That part of Florida was a wilderness when the territory was ceded by Spain; but it is now rapidly settling by intelligent and enterprising men, who are turning their attention to the cultivation of sugar.

Some persons are of opinion that the production of sugr now does not equal its consumption, and that the increased demand has been partially supplied by the old stock. If this is correct, it is to be hoped the cultivation of sugar will be still more promoted in Louisiana; and introduced and extended in Mississippi, Alabama, Florida and Georgia.

A Vermont farmer inclines to the opinion that Broom Corn may be profitably cultivated with a view to the sugar that can be obtained from it. He also recommends experiments to ascertain whether sugar cannot be obtained from other northern vegetables in sufficient quantities to warrant their cultivation partly for this purpose.

We learn that the *Sugar Cane* is flourishing luxuriantly in one or two gardens in this city. We learn also that in a garden at the lower end of the city, a stalk of *Oronoco Cotton* has reached the height of upwards of six feet. It is a beautiful plant, and worthy the inspection of the curious.—It is said the plant will grow into a tree of considerable size, and that it will not attain its maturity before the second year from its planting.—*Augusta Const.*

First Bee Hives—It has been long a custom in *Vlodia*, to make cavities in the trees of a forest for the purpose of receiving and rearing swarms of bees. Some proprietors have hundreds and thousands of such trees. Those which are chosen for this purpose are large oaks, firs, pines, alders, &c. It is found that the pure air of the higher regions agrees better with the bees than the air of hives resting on the ground, in which, owing (it is presumed) to the pernicious exhalations of the earth, disease frequently makes great ravages.

Another advantage of this plan is, that it never becomes necessary to kill the bees, and that honey may be taken at pleasure, if it can be spared, during the whole of the summer, by simply removing, or unlocking and opening the slip of board which covers the longitudinal opening in the cylinder, in the middle of a warm day, when most of the bees are out. This, as we have elsewhere mentioned, (*Encyc. of Gard. § 1738*) we have seen done every two or three days, for the use of a family, during a residence of above three months in a small Polish town on the Russian frontier.—*London.*

Separating Wax and Honey from the Comb.

When your honey is cleared from the comb, put your wax into a coarse canvass bag along with some pebbles; tie the bag up close, and put it into a pot, or saucapan, filled up with water. Place the pot on the fire; let it boil for some hours; then take it from the fire, and set it in a cold place. The next day you will find a fine even cake of wax floating on the water, free from all impurities. The reason of putting pebbles in

the bag is to keep it at the bottom of the pot otherwise it would rise, and attach itself to the supernatant cake of wax. The water that remains contains a good deal of saccharine matter; and by adding more honey, (as proportion requires) it may be used for making mead.

The following is a good method of separating the honey from the comb.—When you cut out from an old hive, the honeycomb, put the same on flat dishes, or shallow wooden trays, made of linc or willow wood (as deal wood, and some others, might give an improper flavor to the honey,) and carry these trays into a room with closed windows, otherwise your bees will find them out, and give you much trouble and annoyance. Then with a knife and fork cut from the comb the purest, which I shall call No. 1; put it into a pan, and cut it into small pieces; after this, put the above into a coarse sieve, (where the holes are about 1-14th part of an inch,) and let it filter into a pan set under the sieve.

The remaining honeycomb, which I shall call No. 2, must be treated in the same way as No. 1, but will give an inferior honey, in consequence of the comb containing a yellow matter, called beebread, which the honey dissolves, and derives from it a yellow color and disagreeable taste.

I have only to remark that honey from young bees does not require the above assortment, being all white and pure: it is hence called virgin honey.

On the Cultivation of the Annual Sunflower.—Sir—allow me to recommend, through the medium of your useful miscellany, the cultivation of the annual sunflower, as possessing the advantages of furnishing an abundance of fodder for cattle, in their leaves. When, also, they are in bloom, the bees flock to them to gather sweets. The seed is valuable for feeding sheep, pigs, &c. It produces a striking effect on poultry, in occasioning them to lay more eggs than usual; the dry stalks burn well, and the ashes afford a considerable quantity of alkali.—*English Mag.*

Timber.—An English paper recommends that prohibitory duties be laid upon the importation of American timber, "the crevices of which are found to be filled, absolutely filled, with bugs." Some new houses have been erected in Regent's Park, in the construction of which American timber has been employed, and "the insects from it are already numerous and troublesome."

A Mammoth Peach.—A peach of the *malacatoon* kind was picked this season, in the garden of ST. LAS FELTON, Esq. of Marlboro', which weighed 9-1-2 ounces, and measured nine inches and a half around.—*Concord pa.*

Large Pears.—In the same gentleman's garden three pears were blown from the tree, last week, which were yet unripe and hard; they were of the *Anory* kind, which do not reach maturity till the middle of October. These pears were of the following weights and measurements:—

- | |
|--|
| 1. Pear, 1 lb. 8 oz. measured 14 3-8 inches. |
| 2. " 1 " 7 " do. 14 1-8 " |
| 3. " 1 " 1 " do. 12 7-8 " |
- The total weight of the three, 4 pounds.—*Ibid*

AGRICULTURAL SELECTIONS.

The French have paid particular attention to sheep since the time of Colbert, and there are now considerable flocks of short woolled and Spanish breeds in some places, besides several national flocks. Sheep are housed and kept in folds, and in little yards or enclosures, much more than in England. One third of the sheep in France are black. Birkbeck considered the practice of housing as the cause why the foot-rot is so common a disease among the sheep of France. The shepherds have thatched huts placed upon wheels when they attend the flocks at night, and are accompanied by dogs to defend the flocks from wolves, which still abound in Picardy. Hay is the general winter food, and in some parts of Picardy, turnips.

The beasts of labour are chiefly the ox on small farms, and the horse on the larger. Both are kept under cover the greater part of the year. The breeds of oxen are very various; they are generally cream-coloured, but the best are in Normandy, which furnishes also the best breed of working horses, as Limousin does for the saddle. In the south of France the ass and mule are of frequent use in husbandry.

A royal stud of Arabians has been kept up in Aurilla in Limousin, for a century; and another has been formed at Nismes, from an extensive importation.

The best dairies are in Normandy; but in this department France does not excel. In the southern districts, olive, almond, and poppy oil supply the place of butter; and goat's milk is that used in cookery.

Poultry is an important article of French husbandry, and well understood as far as breeding and feeding. It is thought that the consumption of poultry in town is equal to that of mutton. The poorest cottager owns a few hens, and a neat little roost in which they pass the night secure from dogs, wolves and foxes.

The brood of swine is in general bad; but excellent hams are sent from Bretagne, from hogs reared on acorns, and fattened off with maize. Pigeon houses are not uncommon.

The management of fish ponds is well understood in France, owing to fish in all catholic countries being an article of necessity. In the internal districts, there are many large artificial ponds, as well as natural lakes, where the eel, carp, pike and a few other species are reared, separated and fed, as in the Berkshire ponds in England.

The forest culture of France is scientifically conducted, both in the national forests and on private estates. The chief object is fuel; charcoal, bark; and next, timber for building; but in some districts, other products are collected, as acorns, mast, nuts, resin, &c.

The cultivation of the vine is an important object in France, where it is kept low, and treated more as a plantation of raspberries or currants would be in England. It is either planted in large plots, in rows two or three feet apart, and then plants at two or three feet distance in the row; or it is planted in double or single rows alternating with ridges of arable land. The sorts cultivated are almost as numerous as the vineyards. Fourteen hundred sorts were collected from all parts of France by order of the Comte Chapal, and are now in the nursery of the Luxembourg. The *pineau* of Bergoyne, and the *au-*

vrat of Orleans, are esteemed varieties, and these, with several others grown for wine-making, have small berries and branches like the English Burgundy grape. Small berries, and a harsh flavor are preferred for wine-making both in France and Italy. The oldest vines invariably give the best grapes and produce the best wines. The Baron Peyrouse planted a vineyard twenty years ago, which, though in full bearing, he says is too vigorous to enable him to judge of the fineness and quality of the wine which it may one day afford. In the Clos de Vagois vineyard, in which the most celebrated Burgundy wine is produced, new vine plants have not been set for three hundred years; the vines are renewed by laying the old trunks, but the root is never separated from the stock. This celebrated vineyard is never matured. The extent is one hundred and sixty French arpents. It makes in a good year from one hundred and sixty to two hundred hogheads, of two hundred and sixty bottles each hoghead. The expense of labour and cooperage in such a year, has arisen to 33,000 francs, (£1,220) and the wine sells on the spot at five francs a bottle. The vineyard is of the pineau grape. The soil, about three feet deep, is a limestone gravel on a limestone rock.

The white mulberry is very extensively cultivated in France for feeding the silk worm. It is not placed in regular plantations, but in crders, rows along roads, or round fields or farms.

The trees are raised from seeds in nurseries, and sold generally at five years, when the have strong stems. They are planted, stakes and treated as pollards. Some strip the leaves from the young shoots, others cut these off twice one year and only once the next; others pollard the tree every second year.

The eggs of the moth (*Bombyx mori*) are hatched in rooms heated by means of stoves to eighteen degrees of Reaumur. One ounce of eggs requires an hundred weight of leaves, and will produce from seven to nine pounds of raw silk. The hatching commences about the end of April, and, with the feeding, is over in about a month. Second broods are procured in some places. The silk is wound off the cocoons or little balls, by women and children. This operation is reserved for leisure days throughout the rest of the season, or given out to women in towns. The eggs are small round objects; the caterpillar attains a considerable size; the chrysalis is ovate; and the male and female are readily distinguishable.

SILK.

The statute book of Connecticut now contains regulations for inspecting silk, as the growing and manufacture is still carried on extensively in some districts. The trees planted thirty and forty years ago are yet standing, of giant growth; many of them are cutting down to be used as steam-boat timber. I know of one person who rents out his trees to feed the silk-worm at a very handsome rent: equal to that for a good farm.

The timber of the mulberry is said to be as lasting as the cedar or the chestnut, its growth is rapid; in Ohio it will come to maturity in a little more than half the period required in the eastern states; it is therefore an object of the first importance if used only for timber; no farmer should delay a single moment the planting of his nursery. The amount of silk manufactured yearly in England is fifty million dollars; exports half a million.

With a little attention the United States will become the greatest silk country in the world; a hundred millions a year will be a small estimate for its ability.—*West Tiller.*

SYMPTOMS AND PROGRESS OF THE ROT IN SHEEP.

In the first stage of the rot, the sheep is in the frequent habit of rubbing the under lip against the fold, or its own fore legs, or any other hard substance; also of drinking a greater quantity of water when at the sheepfold than those that are sound, and showing a disposition rather to lick off the moisture from, than to crop the grass. In the second stage, the lips, nostrils, and throat, become swollen; the animal is feverish, insatiably thirsty, and almost incessantly visited by a sort of dry cough. In the third and last stage, the eyes become sunken; the eye-veins, small, discoloured and nearly bloodless; the eye-balls livid and dim, with whites exceedingly pale, the burrs of the ears swollen, and free from wax; the liver, lights, and throat ulcerated; and the passage of respiration being stopped, the animal is suffocated. "I was led to this experience," says the writer, "when very young in business, by an old shepherd who had been more than forty years upon the farm. Pointing to a sheep rubbing its lip against the fold, and acting otherwise in the manner above described, 'That sheep, master,' said he, 'is touched with the rot. The best thing I can recommend you to do with him is, to take him home before he is too far gone, give him some ground oats, and make him tidyish meat, and kill him.' I did so, as sheep will thrive upon oats for some time after they are first affected; and when the sheep was opened, I discovered that the liver was full of things resembling plaice, and its lights just beginning to become ulcerated. The next sheep I found in the first stage as above mentioned, I suffered, by way of experiment, to take its chance, and it died, by suffocation, in the third stage, as above stated, which was the result of at least a dozen experiments."—*N. F. Memoirs.*

SEED WHEAT.

The wheat generally raised in this province, is of two kinds, called the *bearded* and the *bold*. The bearded wheat is very liable, in wet seasons, to be affected with mildew or rust, and the bold wheat to the attack of the Hessian fly; and we are sorry to say, that the very fine prospect of a wheat crop, which was so general in the early part of the season, both in this province and in Nova Scotia, from the various accounts which we have heard, is in a great measure cut off. We have now to call the attention of our readers to a new species of wheat lately introduced into this province. The history of it, we are informed, is as follows:

Four years ago, a Mr Camp, living at Jemang, bought a chest of tea in this city, and when he opened it, he found a few grains of wheat in it—these he carefully sowed, and the seed has been kept and sowed from year to year since, and it is now supposed, at a low calculation, that from 500 1000 bushels of this wheat will be raised this season. It grows larger and stouter in the stalk, and is more prolific than any previously raised in this province. And what renders it peculiarly valuable, is, that in every different situation in which it has been sown, it has never been affected with either mildew, Hessian fly, smut, or blast.

ed cars. It has been sown this year, by George Hazen, Esq., at the Vale, and by different persons at Grand Lake, Sheffield, and Mangerville.—This is well worth the attention of Agriculturalists.—*St. John, N. B. Gazette.*

SHALLOTS.

This vegetable, the *Allium Ascalonicum* of Linnaeus, sometimes termed Eschalotte, is a native of Palestine, whence it has been introduced into our kitchen gardens. It is raised from suckers, which should be set out either in autumn or early in the spring, in beds or furrows, at the distance of about three inches from each other. Towards the end of June, the stems are tied up; and, in the course of another month, the plants are pulled out of the earth; when they are exposed to the air to dry, and afterwards preserved in some dry airy place.

The roots of the shallot are very pungent; have a strong but pleasing smell, and are preferred to onions, as ingredients in highly flavoured soups and gravies. They are also pickled, in which state considerable quantities are consumed in the East Indies.

This plant, when mixed with vinegar, rice and honey, is said to be serviceable against the bite of a mad dog; we doubt, however, the efficacy and propriety of such an application. It is also recommended as an excellent cephalic, especially when inhaled through the nostrils; but its most beneficial properties are those of creating an appetite, and expelling foul air.—*Domestic Encyclopedia.*

A mode has been suggested of getting glass stoppers out of bottles, viz. placing the bottle in a pan of cold water and the whole upon the fire, provided what may happen to be in the bottle be not liable to serious injury from the heat. The air inside will thus become gradually expanded, and the stopper driven out. It will be proper to attach a piece of cloth loose over the stopper on the neck, to prevent its flying out so as to do mischief.—*Mechanic's Magazine.*

POWDER MILLS.

Among several interesting articles extracted from foreign scientific publications for the American Journal of Science and Arts, we find the following on the subject of Powder Mills. Though it is well known that the use of iron in the machinery of these establishments, is attended with danger, we believe it is generally supposed that copper may be substituted with safety. The result of experiments, however, shows that such is not the fact.—*Can. Courant.*

Although great care is taken to exclude from these manufactories all articles of iron, and to substitute copper and other metals, in the metallic parts of the machinery, which will not strike fire, yet it is well known that explosions attended with disastrous consequences, are very frequent. Excited by an occurrence of this nature, *M. Aubert*, Col. of Artillery, was induced, in conjunction with *Capt. Tardy*, to resume some experiments which he had unsuccessfully tried, to ascertain, whether gunpowder would not explode by the shock of copper. The result of these renewals was that powder would inflame by the stroke of copper upon copper. This gave rise to further investigation, in presence of the committee of safety, and it was ascertained that gunpowder could be exploded by the stroke of iron upon iron; iron upon copper; copper upon copper; iron upon marble; and by using the halistic pendulum, by lead upon

lead; and with suitable precautions even by lead upon wood. The experiments were successful both with English and French powder. The experiments most clearly show, that in all the manipulations of a powder manufactory, all violent shocks and percussions should be carefully avoided, since they may occasion the disengagement of sufficient heat to produce the inflammation of powder.—*Bul. d'Encouragement, Juin, 1826.*

ESSEX AGRICULTURAL SOCIETY.

The Committee of Arrangements, for the Annual Exhibition of the ESSEX AGRICULTURAL SOCIETY, which is to be at West Newbury, (near the tavern of Col. MOSES NEWELL), on Wednesday the 10th inst. would give notice:—

That all claims for premiums for stock, must be entered with the Secretary, on or before 9 o'clock A. M. of the day of Exhibition.

That all animals offered for premiums must be at the place of Exhibition as early as 8 o'clock, that there may be time to arrange them in their places by 9 o'clock, after which none will be admitted.

That a room has been procured at the house of JOHN FOLLANSBEE, for the exhibition of manufacturer articles; at which place all articles of this description must be entered as early as 9 o'clock.

That the Ploughing Match will commence at 11 o'clock, on a piece of ground near the Meeting-House. Persons intending to engage in this, are reminded that this intention must be made known to the Secretary of the Society, or Col. Newell, of W. Newbury, as early as the Monday previous to the Exhibition.

That the premiums are offered to all, and are not confined to members of the Society.

The Society will dine together at one o'clock.—Tickets for the Dinner will be furnished by Mr Nathl G. Tyler.

A room for the accommodation of the Trustees has been provided at the house of Mr RICHARD HEATH; at which place the Trustees and persons appointed on Committees, are requested to meet at 9 o'clock.

The Meeting of the Society for the transaction of business will be at the Meeting-House, at 3 o'clock P. M.

Messrs. Jesse Putnam, David Emery, Josiah Newhall, Moody Bridges, Jeremiah Colman, and Samuel Tenny, have been appointed Marshals on this occasion, and will be respected as such.

By order of the Com. of Arrangements,
J. W. PROCTOR, Sec'y.

Danvers, October 1, 1827.

CROPS IN NOVA SCOTIA.

We regret to observe, by the following extract of a letter from the "Acadian," that the unfavorable weather which has lately been felt in some of the Eastern districts, has extended over the Western portion of the country, and that the crops are not likely to answer the promises of the summer. There is not, however, as we can hear, any danger apprehended of a total failure, though much damage has been done.—*Halifax Recorder.*

Annapolis, Sept. 10, 1827.

"I am sorry to hear, from all quarters, that the wheat crop will be very deficient this year, throughout the western part of the province. With few exceptions, the farmers in general will have but half of what they confidently expected from the promising appearance of a few weeks ago; but they are a contented, manly people, and know upon what grounds to be reconciled to their losses.

Their Hay crops have been very abundant, but they cannot, as yet, pronounce upon their Indian Corn or Potatoes."

Gardens in Ships.—To sow in the temperate zone, and reap between the tropics, is a somewhat singular thing. Yet (says the Weekly Review) it is constantly done. For the great East India ships, in imitation of the Dutch who first introduced the practice, have little salad gardens in flat wooden boxes on their poops, where the seed acted upon by a heat increasing daily, shoots up in surprisingly rapid manner. In these gardens the number of crops in the year are more numerous than in any spot on earth, but the gardeners, if so minded, can command almost any temperature.

N. Y. Statesman.

Chokedar.—The inhabitants of Bengal usually sleep with their doors and windows open. A chokedar (or watchman) is employed by every respectable family. This man frequently belongs to a gang of robbers, and is considered on that very account as a much better protection than an honest person. He walks round the house and grounds, and calls the hour until he thinks the family are asleep. He then fixes his spear in a conspicuous situation, and then goes to sleep himself, without any further trouble or anxiety. The robbers recognize his weapon, and never injure their comrade by attacking the house.—*Weekly Review.*

It is in contemplation to build a splendid Hotel on the land belonging to the estate of the late Mr. Phillips, in Common-street, Boston—Fourteen gentlemen have already subscribed \$10,000 each, to promote the plan, and we hear that the subscription is to be increased to \$250,000.

The Colombian dollar is singularly deficient in standard and weight, its current and actual value being only 75 cents; while the current value of the dollar of Mexico, Central America, Peru, Chili, and La Plata, and the Brazilian piece of 900 reas, (dollars re-stamped) is 100 cents, and the actual value of nearly all of them a fraction more than that.—*Savannah Georgian.*

Rich Landlord.—It was lately asserted in the British House of Lords, that one of the members of that body who complained that the Corn Laws would ruin him and other Landholders, owns no less than five hundred acres of the land in the Metropolis of England and most of it so valuable that he leases it out by the inch.

Debts.—Dr Johnson says, that small debts are like small shot, they are rattling on every side, and can scarcely be escaped without a wound. Great debts are like cannon, of loud noise and little danger.

Husband's Authority to Correct his Wife.—The authority which the husband has sometimes claimed, under the law, to inflict corporal chastisement upon his wife, seems not to have been given by the Hindus. Their code contains the following beautiful maxim. "Strike not, even with a blossom, a wife guilty of a hundred faults."

In the botanic garden of Chelsea, England, there are no less than 330 species of foreign wheat at this time ripening, besides forty sorts of oats, and eighteen varieties of barley.

MIDDLESEX CATTLE SHOW,

Exhibition of Manufactures and Ploughing Match, at Concord, Oct. 10, 1827.

The Committee would give notice to the members of the Society, and to the public, that they have nearly completed the necessary arrangements for the due regulation of the Farmers', Manufacturers' and Mechanics' Holiday.

From the great utility of such exhibitions as we have heretofore witnessed, and the increased zeal and attention of our citizens to the great objects of the Society, we have reason to anticipate a much greater display of the works of nature and art this year, than in any former one.

Proper pens will be made for the exhibition of all animals offered for a premium, and assistance furnished in confining and arranging them.

Such Manufactures and Fabrics, improvements in Machinery, and all implements of husbandry offered for premium, must be entered at the court-house by 10 o'clock, A. M. on the day of exhibition, where directions and aid will be given. Persons in the more immediate vicinity are requested to forward their articles for exhibition, at the Court-house, at as early an hour in the morning as possible.

The *Ploughing Match* will take place at nine o'clock, A. M. precisely, and those who wish to contend for the prizes must leave their names with NATHAN BROOKS, Esq. Secretary of the Society, by eight o'clock, A. M. on the day of the exhibition.

A procession of officers and members of the Society will be formed at half past ten o'clock, A. M. and proceed to the meeting-house, where an Address will be delivered by the Hon. EDWARD EVERETT.

After the ceremonies at the Meeting-house, the several Committees will immediately proceed to the discharge of their duties.

The *trial of strength and discipline of Working Oxen*, will take place immediately after the service in the Meeting-house.

A dinner will be in readiness at 2 o'clock, P. M. At 4 o'clock, Premiums will be publicly declared at the court-room, in the Court-house.—At 5 o'clock, the Society will meet at the Hotel for the choice of Officers for the ensuing year.

CIDER.

The orchards are bending under the weight of apples, and the time of making cider is near at hand. The general process is understood, but attention to two or three particulars, may greatly increase the value of the liquor. Why does Burlington cider bring, in market, double the price of that made elsewhere?

Use water freely in making every thing sweet and clean before you begin—but very sparingly afterwards.

Put your apples after being gathered for a few days in a dry place, exposed to the sun.

Let your casks be perfectly sweet.

See that the straw used be clean and bright.—Throw all the rotten, or rotting apples to your pigs. Keep the several sorts of apples separate; if ground together, the cider will not be so good.

When the liquor has undergone sufficient fermentation to throw off the impure matter in it, and

while it is yet sweet, take a clean cask, put into it a bucket of cider, set fire to a clean rag that has been dipped in brimstone—let it burn inside the cask so as to fill it with the fumes of the brimstone—shake the cask well, and then fill and bung it tight.

This mode is highly recommended to preserve the cider sweet, while it will yet be pure. The crab apple should be more extensively cultivated for cider. Liquor, delicious as wine, may be made from it. We received from Mr EUSEBIUS TOWNS-ENO, this summer, a barrel of bottled crab cider, which, during the warm weather was far more grateful to the taste, and we are sure, more wholesome, than any other drink that could be used. On opening several of the bottles, the cider foamed and sparkled like Champagne wine. The apple crop properly managed may be made very profitable. A small orchard below West-Chester, two years ago, produced to its owner, several hundred dollars.—*Village Record.*

SHEEP.

The English have had more regard to the form than to the fleeces of their sheep, and most of the 44 millions in that country are of the long-woled large breeds. Fine wool for the manufacturers is imported from Saxony and Spain. The Saxons have given their attention to the fleeces, which they have brought to so great perfection, that Spain possesses no flock that can be compared with some of those in Saxony. Sheep of the Saxon race are pretty numerous in the countries of Silesia, Moravia, &c. In France there are but few flocks of pure merino blood. The French import great quantities of fine wool from Spain and Saxony, and they are now making efforts to introduce the Saxon race of sheep into France.—*Hamp. Gaz.*

Pilfering Fruit.—At the late term of the Court of Common Pleas in this town, John Marsh was indicted for stealing three water melons from the garden of Benjamin Heywood, in Grafton, on the 26th of the last month, (Sabbath day) to which he plead guilty, and was sentenced to pay a fine of ten dollars and costs of court, amounting in all to about forty two dollars. The court was disposed to award a heavier fine, but was prevented by the supposed inability of the defendant to pay a larger sum. Such an example was wanted, and we hope it may do good. If a regard to character and the rights of others, is not sufficient to deter from this most mean and odious description of pilfering, the law should be rigidly enforced against the violators of it. Good fruit would be more generally cultivated if the owners could be protected in the enjoyment of it. One very worthy old man in this town had a valuable peach tree, which bore very full the present season, giving promise of an abundance of excellent fruit, but before they were ripe the marauders commenced their nightly havoc upon it, which so irritated the old gentleman that he cut down the tree to save the fruit!—*Ware, pa.*

ASTRONOMY.

* * * But worlds and systems of worlds are not only perpetually creating, they are also perpetually diminishing and disappearing. It is an extraordinary fact that within the period of the last century, not less than thirteen stars in different constellations, none of them below the sixth magnitude, seem totally to have perished; forty have changed their magnitude by becoming

either much larger or much smaller; and ten new stars to have supplied the place of those that are lost. Some of these changes may perhaps be accounted for by supposing a proper motion in the solar or sidereal systems, by which the relative positions of several of the heavenly bodies have varied. But this explanation, though it may apply to several of the cases, will by no means apply to all of them; in many instances, it is unquestionable that the stars themselves, the supposed habitations of other kinds or orders of intelligent beings, together with the different planets by which it is probable they were surrounded, and to which they may have given light and fructifying seasons, as the sun gives light and fruitfulness to the earth, have utterly vanished, and the spots which they occupied in the heavens have become blanks. What has befallen other systems will assuredly befall our own; of the time and the manner we know nothing, but the fact is incontrovertible; it is foretold by revelation, it is inscribed in the heavens, it is felt throughout the earth. Such is the awful and daily text; what then ought to be the comment?—*God's Book of Nature.*

Hereditary Insanity.—By great temperance in living and avoiding mental emotion and exertion as much as possible, insanity may be prevented, even where the predisposition to it is strongly marked, till at length the predisposition itself is worn out. By looking at the subject in this point of view, that dread of insanity which exists so strongly in many minds may be greatly lessened. as it holds out a reasonable ground for expecting that the tendency to the malady may be gradually overcome, and that by simple and practicable means.—*Lancet.*

Cultivation of the Vine.—We have received, and hastily looked over a little work entitled, "the American Vine Dressers' Guide, by Alphonse Loubat." This gentleman is a practical man, who for years in the south of France has been personally engaged in the cultivation of the vine. He has conceived the project which he thinks, and as it appears to us upon very just ground, very practicable of introducing, as far as depends upon him, the general cultivation of this productive plant in the United States; and having already imported and planted skillfully many thousand vines, he now gives directions as to the manner of treating them in all their various stages. To those who are engaged, even on a small scale, in raising grapes, this little volume will, we think, be useful and instructive: and we wish that it may lead many to enter upon the cultivation of the vine. One good effect which would result from the general introduction of this plant, and the consequent abundance and cheapness of light wines, would be a diminution of the intemperance which now so discreditably marks the character of our population: for it is justly said by Mr. Loubat, in concluding his preliminary address that "it is notorious that all the nations among whom the grape vine is cultivated, are extremely sober and temperate."—*N. Y. American.*

This book is for sale at the New England Farmer office, price 50 cents.

Facts.—A single mercantile house, on Long-wharf, has sold, since the first of January last, thirty-seven thousand barrels of *Genesee flour*; of which less than three hundred barrels have been disposed of coastwise; the remainder has been

sold to country traders, and chiefly to those in the manufacturing villages.

Another house has paid, since the first of April, one hundred and fifty thousand dollars for American wool, purchased of the farmers and wool-growers in the New-England States and New-York, and sold out again to the manufacturers of New-England.

The Boston and Canton Factory Company imported, during five months preceding the first of May last, one million pounds of Smyrna wool; all of which is used in its own factory, in the manufacture of what is called negro cloth.

Is it possible that our manufacturing establishments can be detrimental to commerce and agriculture, when a single establishment imports wool enough in five months to freight three or four ships, (to say nothing of other articles necessarily used in the manufacture of the wool,) when a single dealer in American wool pays, in the same time, to the farmers, 150,000 dollars, and another individual receives from another portion of farmers, and sells off to the country merchants, flour enough to make its first owners rich, if not independent?—*Boston Courier.*

GREAT CROP OF RUTA BAGA IN VIRGINIA.

Baltimore, 9th Mo. 4, 1827.

FRIEND J. S. SKINNER.—John Darby, a respectable citizen of Richmond county, Va. has written me on the 20th ult. informing that he, the last season, had reared 750 bushels of the ruta baga or Swedish turnip, upon one acre of land—and from the well known veracity of the said Darby, there is no doubt of the fact, which is very encouraging indeed—and I think that many of the failures in the culture of this crop are owing to neglect at some stage or other in their growth, for most kinds of vegetables require rich soil, and frequent cultivation, to insure a profitable return.

Thy friend, ROBT. SINCLAIR.

TO EXPEL WITCHCRAFT.

Reginald Scett in his book on Witchcraft, gives the following charm to find the witch who has bewitched cattle:

"Put a pair of breeches upon the cow's head, and beat her out of the pasture with a good cudgel upon a Fridaish, and she will run right to the witches dore, and strike thereat with her horns."

It is a curious circumstance that there should be annually delivered in Huntingdon, England, a lecture upon the subject of Witchcraft. A fund for this purpose was left by Sir Samuel Cromwell, in 1593, whose wife was bewitched by some persons, who were afterwards executed, and their property escheated to Sir Samuel, as Lord of the Manor. He gave the amount to the mayor and aldermen of Huntingdon, on condition that an annual lecture on this subject, should be preached on Lady day, by a Doctor or Bachelor of Divinity, of Cambridge University.—*Salem Observer.*

Among the farmers of Norway, who very much resemble what English farmers once were, the family plate of butter seems to be the state dish of the house; in any one of which, if the smallest quantity be wanted, a mass is brought forth, weighing six or eight pounds, and so highly ornamented, being turned out of moulds, with the shape of cathedrals set off with gothic spires and other devices, that a stranger is unwilling to destroy so novel though perishable an edifice.

MISCELLANEOUS ITEMS.

Good Peaches have been sold in New London market this season at 12 cents the bushel. In Boston we pay our farmers much better.

In felling a huge Hemlock Tree in Hope, N. Y. it was discovered that it had been wounded, by some sharp instrument when it was only six inches in diameter. On counting the marks of annual growth, it was estimated to be 218 years since the wound was inflicted.

Great Crop.—40 acres of rye, belonging to Dorus and Linus Green, of Hadley, yield at the rate of forty bushels to the acre, making the whole crop 1600 bushels, all from one field.—*Hampshire Gazette.*

Cider.—The editor of the Worcester Spy states that cider is so plenty in that vicinity, that it is delivered, abundantly, at the distillery for sixty cents per barrel.

Not very Profitable.—In the upper part of South Carolina, near Greenville, gold has been discovered, the land purchased, and a regular set of workmen employed in procuring the ore. The metal is good, and the quantity found is worth "something more than a dollar" a day for each man.—*Query*—could not a man clear as much by digging potatoes! The most profitable kind of money digging, after all, will be found in digging the surface of the ground in tillage.

The London Steam Washing Company have broken up. Their premises which cost £40,000, have been sold for £25,950.

The St. Catherine's Dock Company, London, are said already to have pulled down upwards of 1,000 houses, and to have paid to the owners and occupiers of property, which they have taken possession of, nearly £700,000.

The Northern Lights are something similar in their appearance, to the light which will reflect on the wall of a room, if a basin of water is placed in sunshine in the middle of the floor, and the water is agitated.

The Witnibago Indians are said to calculate so much on war, that they have dug holes in the ground to hide their women and children. Poor fellows! By going to war they will dig the graves of the whole tribe!

Thirst.—Labouring people should be informed, that they might preserve their health by abstaining from drink during the heat of the day; and if they drink copiously of water or whey in the evening, thirst will not assail them in their working hours. This remark was made and recommended by an officer of high rank in Africa.

The chair placed in the Speaker's desk in the Pennsylvania capitol, was brought to Philadelphia from England, by William Penn, and was occupied by John Hancock, as President of the continental Congress.

The Independent Courier, published at Ellsworth, Maine, states that a paper manufacturer, a wheelwright, a cabinet and chair maker, a tinman and a barber, are wanted in that flourishing village.

We understand the late rains have damaged the Blackstone Canal, new in the course of excavation, to the amount of 30 or 40,000 dollars. It was filled full of water in some places for miles together, and in other places the embankments were washed away.

The Stockbridge Star states that for the last two years, while the population of Berkshire has been constantly increasing, criminal cases in the Courts of that county have been constantly declining, and that at the present September Term of the Supreme Judicial Court, out of a population of about 40,000 persons, not one has been presented by the Grand Jury for any offence whatever.

Fishing.—On Thursday a fisherman, and two lads, caught 1200 large Mackerel in two hours in Boston bay.

Spontaneous Combustion.—A few days since in removing a quantity of dry coal from a large lot in a second story in a building, on one of the wharves in town, the laborers discovered a portion of it to be on fire. So large a body indeed was ignited that it had charred several planks and joists in the floor. The singularity of this instance makes it deserving of record.—*Newburyport Herald.*

The New York Daily Advertiser, in speaking of the mania of steam-boat passengers, to make the trip between that city and Albany a few minutes quicker than any others have done, thus exemplifies the passion which some men have to hurry. "An old gentleman in New England conveyed a just idea of the character of those who were so fond of travelling at such a wondrous rate, when he said he believed "his son John, if he was riding on a streak of lightning, would whip up."

A Good Chance for Editors.—The proprietors of Chambers' medicine for the cure of drunkenness, give notice to Editors who will insert their advertisement, that they shall be furnished with enough to cure one drunkard.

Although the late equinoctial impeded navigation for a few days, we have not heard of any other injury from it on the New England coast. The losses by it to the peach orchards in this vicinity have been very heavy. To the owners of several of them the loss is said to have exceeded 1000 dollars each.

Example to Servants.—A gentleman in the vicinity of Canterbury had a servant who lived with him 35 years, at the end of which period, he received £350 wages. He was never known to be intoxicated, and the key of the wine and beer cellar was left rusted in the lock for eleven years.

[English paper.]

The Colombian dollar is singularly deficient in standard and weight, its current and actual value being only 75 cents; while the current value of the dollar of Mexico, Central America, Peru, Chili, and La Plata, and the Brazilian piece of 960 reas, (dollar re-stamped) is 100 cents, and the actual value of nearly all of them a fraction more than that.—*Savannah Georgian.*

Arctic Expedition.—Mr. J. N. Reynolds has published a statement in the Baltimore papers, by which it appears that final arrangements have at length been made for the construction of a vessel especially suited to the rugged service of a polar expedition. The expenses of the voyage, Mr. R. says, are now brought within narrow limits—the whole amount necessary to furnish the expedition, in instruments, armament, provisions, clothing, and pay for a well chosen crew of seamen, and able and experienced officers, with every necessary comfort and convenience, is at this time in readiness. The expedition will sail next spring.—*Salem Register.*

CAUSES OF SUPERIORITY OF BRITISH FARMING.

The great body of cultivators in Great Britain, whose farms are of any considerable extent, have generally received a suitable education, by which their minds are enlarged; animated with a desire to improve their condition in the world, and rendered equally quick to perceive, and ready to adopt such improvements as may occasionally be proposed. In former times it was objected, that farmers were an obstinate and bigoted class of men, averse to every kind of innovation upon established practice, and persisting in ancient systems, even after their deficiency and utility had been ascertained in the most decisive manner.—Whatever truth there might formerly be in the objection, its force is now completely removed; there being no set of men whatever more open to conviction, or more willing to adopt new practices than British farmers of the present day. This change of disposition has been accomplished by a general circulation of agricultural knowledge, since the National Board of Agriculture was established; by numerous periodical publications upon rural economy; and by that increase of wealth which flowed from the exertions of the farmer, and which naturally stimulated a search after new improvements. According to the measure of attention bestowed upon the education of farmers, it may be expected that improvement will hereafter advance. A man of uncultivated mind may hold a plough, or drive a harrow in a sufficient manner; but he will seldom introduce an improvement or be the means of effecting any change in the established system of rural economy.

Brown's Treatise on Agriculture and Rural Affairs.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, OCT. 5, 1827.

FOR THE NEW ENGLAND FARMER.

LUCERNE.

MR FESSENDEN.—The growth of Lucerne is not only more rapid than that of any other of the cultivated grasses, but it is also more rapid in our climate, than it has been represented to be by any of the sanguine recommenders of it in Europe.—On the 26th of April last, I bought 6 pounds of Lucerne seed at the office of the New England Farmer, and the next day sowed 4 lbs. of it on about a third of an acre of well prepared ground. I sowed with it about as much barley as I thought would protect it against weeds.

I cut the barley on the 28th of May, and the Lucerne was then 9 inches high—both were cut together and given to my cows—on the 30th of July the Lucerne was a foot high, and again cut for soiling—early in September the Lucerne was about 15 inches high, and some of it in flower; it was the third time, and made into hay, and gave a good crop for grass even of the second year. It is now up again, and about 8 inches high. Your associate, Mr RUSSELL, the proprietor of the New England Farmer, has seen it in its present state, which is beautiful to the eye, and a complete cover to the soil.

I have already ascertained that it will stand our winters better than clover, having had a small patch of it, which has stood four winters without the slightest injury.

I received by the kindness of Commodore HULL a box of seeds for the Massachusetts Agricultural

Society, brought from South America—among the rest there was a small parcel (about one pound,) which was marked "Chili clover seed." I instantly recognized it to be Lucerne. It came late, and I could not sow it before the 28th of July, having no ground fit for its reception. On that day it was sown, and on the same patch (but separated from it,) some Dutch clover seed, presented to me by EREZEEER ROLLINS, Esq. The Lucerne is now 9 inches high, and the clover about 4 inches.

I think Lucerne must be valuable for soiling.—Although I agree with J. H. POWELL, Esq. that soiling can never be very extensively used on great farms, yet there are many small farmers in New England, who, like myself, can only compass 20 or 25 acres, and yet wish to enjoy the luxuries of a dairy, to supply our own families throughout the year, with better butter than money will procure. To such persons, soiling is of great value, and indispensable necessity.

I bow, with great respect, to the opinions of Col. POWELL's experienced correspondent, Mr RUD, as to the inexpediency of soiling in England; but as that great farmer has assigned his reasons, we may judge of them for ourselves. He says that cows cannot enjoy as good health when soiled, as when indulged with air and exercise in pastures. This may be true in England, though, even there, there are high authorities opposed to the opinion.

My own experience of twenty-one years is of a contrary nature. I have raised my own cows and usually kept them, from birth to 15 years—they have enjoyed the highest health—are admired for their apparent good appearance—and their good qualities are satisfactory to myself. My cows are soiled 10 months in the year—for 2 months they are tethered out, in which last mode they take rather more exercise than if suffered to range.

JOHN LOWELL.

I write "Lucerne," instead of "Lucern," because it is a French word which we have recently borrowed, and I can see no good reason for changing the orthography.

I have said that Lucerne is more rapid in its growth than any other of the cultivated grasses. I have this year compared it with Orchard Grass, sown on better land than that devoted to Lucerne. The Lucerne, in the poorer soil, (though a good and well prepared one) has much surpassed the Orchard Grass.

Roxbury, Oct. 3, 1827.

Rules and Regulations for the Cattle Show, &c. at Brighton, on Wednesday, Oct. 17, 1827.

TIME OF ENTRY FOR THE PREMIUMS.

1. Manufactures & Inventions—Butter, Cheese, Honey, Cider and Currant Wine, before 9 o'clock, A. M. on Tuesday, the 16th, and to be deposited at the Hall and ready for exhibition before 10 o'clock, A. M. of the same day. (*The Hall will be open on Monday, the day previous, for the deposit of articles.*)

2. Stock of every kind to be entered by letter, (post paid) specifying the animals; or by personal application, to JONATHAN WINSHIP, Esq. at Brighton, Secretary of the Show, on or before Tuesday the 16th; and a certificate will be given of such entry, bearing the number of the pen assigned.

3. Ploughs for the Ploughing Match to be entered before nine o'clock, A. M. on Wednesday, the 17th.

4. Working Oxen on or before Tuesday the 16th.

EXAMINATION FOR THE PREMIUMS.

1. The Committee on Inventions, that on *Manufactures*, and also the Committee on *Butter, Cheese, Cider, Currant Wine and Honey*, will commence their examination of the articles entered in their several departments, at ten o'clock, A. M. on Tuesday the 16th.

2. The Committee on Stock at 9 o'clock A. M. on Wednesday the 17th.

3. The Ploughing Match will take place at half past nine o'clock A. M. on Wednesday the 17th.

4. The Trial of Working Oxen at eleven o'clock on the same day.

5. The Auction for Animals and Manufactures at 12 o'clock M. on the same day.

RULES TO BE OBSERVED BY COMPETITORS FOR THE PREMIUMS.

1. All Stock to be in the Pens before nine o'clock A. M. on Wednesday.

2. No animal to be removed from the Pens but by permission of a Marshal.

3. Fat Cattle are to be weighed before being put into the Pens, at the expense of the owner.

4. No animal not bred within the State can be offered for a Premium.

5. The working Oxen to be arranged on the right hand of the Avenue from the road to the Hall, with their heads towards the centre; and the drivers are to remain with them there, until the time for the trial.

6. A Certificate will be required that articles of manufacture offered for premium were wrought within the State—to be delivered to the secretary at the time of the entry who will furnish for each parcel to the person presenting it, a label with a number corresponding with that of the certificate of the entry; to be annexed to the parcel.

7. No Competitor for any premium to be present during the examination unless requested by the Committee;—the Claimants of the premiums for Inventions excepted, who will be required to attend on the Committee to answer such questions as may be put to them; and also to exhibit sufficient evidence that such inventions as are offered by them are of profitable use.

8. After examination the goods will be considered in charge of the owners, but must remain for public inspection until after the auction on Wednesday the 17th, but a night watch will be provided by the Trustees.

9. Each parcel of butter, cheese, honey, cider and currant wine must have upon it the private mark of the owner. The cider and wine to be accompanied with a written statement of the method of making and managing the same.

10. The barrel of cider which obtains the first premium will be used at the society's dinner, on the 17th, and five dollars allowed for the same in addition to the premium.

11. Notice must be given to the Secretary, of the animals and manufactures to be sold at the auction, in season for a list to be prepared for the use of the Auctioneers. The sale to be in the order at the entries.

12. The services of the Auctioneers will be gratuitous; but the government duty must be paid by the owners. The owners will attend to the delivery to purchasers, and collect the purchase money.

PARTICULAR NOTICES.

1. THE SOCIETY will meet at the Hall at one o'clock, P. M. and proceed thence, accompanied by the Committees, invited persons, and other gentlemen, who intend to dine with the Society, to the Meeting-house, where the Premiums awarded, will be announced by the ASSISTANT RECORDING SECRETARY. Some occasional remarks by the Hon. JOHN LOWELL, President of the Society, will close the meeting. A procession will then be formed to Dudley's Hotel, where a public dinner will be provided.

2. The Treasurer will attend at the Hall at 5 o'clock, to pay such premiums as may then be demanded. Persons most distant from home to be first paid.

3. Premiums not claimed within six months to be considered as generously given to aid the funds of the Society.

4. Mr Jacob Kuhn will attend at the Hall to deliver certificates of membership to persons elected members of the Society, at the meeting on the day of the Show, and to others who may never have received their certificates. The sum of five dollars to be paid on admission is in lieu of all assessments, and entitles the new members during life to a copy of any publications which the Society may hereafter make.

5. No persons will be admitted to the Hall except such as have business there, on any day but the day of the Show.

6. The avenue between the ranges of Pens is intended exclusively for the Trustees, Committees, Members of the Society and invited persons. The marshals will therefore be instructed to admit no other persons.

No Booth or Tent or Place for the sale of liquors of any kind will be allowed within the grounds belonging to the Society.—Nor will any openings through their fences to adjoining Lots be permitted.

Tickets for the Society's Dinner may be had of Mr Kuhn at the Hall, and at Dudley's Hotel.

Cultivators of fine fruit are requested to send samples for exhibition at the Society's dinner.

Vegetables remarkable for size or other qualities, will have a place assigned them for exhibition at the Hall.

Gentlemen who have fine animals that do credit to the country, are requested to send them to the pens for exhibition, if not for premiums.

The following gentlemen being appointed the marshals, viz. Major Benjamin Wheeler, Capt. Isaac Cook, Capt. William Prentice and Capt. Joseph Curtis Jun. They will be aided by the civil authority agreeably to the special Law of the Commonwealth in keeping the peace, preserving order and enforcing a compliance with the regulations.

PETER C. BROOKS, } Committee
JOHN PRINCE, } of arrange-
RICHARD SULLIVAN, } ments.

Mr FRANCIS WINSHIP of Brighton has left at the office of the New England Farmer, a few bunches of his grapes, for public inspection. They are from the vine of which some notice was taken page 413 of our last volume. The vine was purchased for the Isabella sort; but the appearance of the fruit is somewhat different from that, and it is thought it may be a new variety. It has had but three years' growth, and has produced this year upwards of 100 bunches of grapes, of large size, fine appearance, and superior flavour.

Those of our subscribers who prefer paying in advance, will perceive that, according to the terms of the paper, it is now due. Payment may be made, by subscribers at a distance, to either of the following gentlemen, who are authorized Agents.—New-York City, G. Thorburn & Son, No. 67 Liberty-street.—Philadelphia, Messrs D. & C. Landregh, Seedsman, No. 85 Chesnut-street.—Huntsburg, Ohio, Lewis Hunt.—Hamilton, Montgomery County, Illinois, John Tillson, Jr. P. M.—Bristolborough, Vt. Holbrook & Fessenden.

The last No. of the North American Review contains articles on the following subjects:—Conventions for Adopting the Federal Constitution.—Who wrote Gil Blas?—Russian Embassy to Bukharia.—M'Kenney's Tour to Lake Superior.—Bowling's Servian Popular Poetry.—Life of Major Cartwright, the English Reformer.—Cooper's Political Economy.—Speeches of Henry Clay.—Reforms in Grammar.—Note.—Quarterly List of New Publications.—Published by Frederick T. Gray, No. 74 Washington street, Boston.—Price \$5 a year.

The last number of the Edinburgh Review contains articles on the following subjects.

Rise, Progress, Present State and Prospects of the British Cotton Manufacture.—Memoirs of the Emperor Baber.—Constitution of Venice.—Scottish Parochial Schools.—English Law.—George III. and the Catholic Question.—Jean Paul F. Richter.—Ellis' Original Letters illustrative of English History.—West Indian Mulattoes.—Society for the Diffusion of Useful Knowledge.—The Present Administration.

A royal bankrupt.—Letters from St Petersburg announce the failure there of the Princess Lobonowky Rustowsky, for seven millions of roubles.

In the seven years, preceeding 1825, the capital convictions in England and Wales amounted to 8244.

The New Brunswick papers complain of violent proceedings of squatters from the United States, on the Madawasha settlement.

Grass Seeds, &c.

For sale at the office of the New England Farmer, No. 52 North Market Street, Boston, a large variety of Grass Seeds, comprising LUCERNE, FOWL MEADOW, ORCHARD GRASS, HERD'S GRASS, RED TOP, RED and WHITE HONEY-SUCKLE, CLOVER &c.—with the largest assortment of Garden and Field Seeds, to be found in New England. Also, 20 bushels fresh Canary Seed; genuine English Rape Seed; Hemp Seed, &c. for birds.

Vine Dresser's Guide.

A few copies of the American Vine Dresser's Guide, by Alphonse Loubat, just published; for sale at the Farmer's office, price 50 cents. Some notice of this work will be found on page 34 of this week's paper.

Shallots.

For sale at the N. E. Farmer's office, a few pounds of Shallot Roots—an account of this vegetable will be found in this week's Farmer, page 53.

Crucifers of Stock Attend.

Will be exposed for sale, at the Cattle Show and Fair, in Brighton, on the 14th inst. the old bull HERCULES, raised and owned in Franklin, 14 of the Holstein breed, one year old the 27th of last March. He is perfectly orderly about fences, docile, and considerably broke to the harness. For strength, size, and beauty, is exceeded by but few. Toms; he must be kept one year at least for a breeder.

Offers will be received at the Pens, until 1 o'clock, when he will be sold if there is any offer sufficient to make it an inducement.

Franklin, Oct. 3, 1827.

Agricultural Books.

For sale at the Farmer's office, No. 52 North Market street, a variety of the most approved books on Agriculture.

New England Farmer's Almanack, for 1828.

Just published, at the New England Farmer Office, and for sale by BOWLES & DEARBORN, 72 Washington Street, and at the Bookstores generally, the New England Farmer's Almanack, for 1828. By Thomas G. Fessenden, Editor of the New England Farmer.

This Almanack, in addition to the usual miscellaneous matter contained in similar works, contains a Calendar of the Courts for each state in New England; the Sun's declination; and 10 pages of agricultural matter on the following subjects:—On Soaking Seed Corn in copper's water.—On Small Farms.—On Charcoal.—On Fish used as a Manure.—On Pipes of a Pig in Poultry.—Agricultural Axioms.—On Fallen Fruit.—On Stagger in swine.—How to raise Cabbages, which shall not be club-footed, by Dr. Green of Mansfield, Ms.—How to Fatten Poultry.—A cheap method of preventing the disagreeable smell of Privies.—Root Steaming with a drawing.—On Cold Trees.—On Painting walls to Mature Fruit.—On Cattle stalls.—Steps of a good Farmer.—On Drying Potatoes—on the value of Time.—Machines for gathering Clover Heads, with two illustrative engravings.—Sir Astley Cooper's Child-birth Outment.—Recipes for the Ladies containing directions for making several kinds of Cake.—Musicalianes, &c.

This Almanack may be purchased, wholesale and retail of O. D. Cooke & Son, Hartford, Con.—Holbrook & Fessenden, Bristolborough, Vt.—Isaac Hill, Concord, N. H.—John Froussier, Keene, N. H.—John W. Foster and Childs & Sparhawk Portsmouth, N. H.—Pearson, Little & Robinson, Portland, Me.—Whipple & Lawrence, and John M. Ives, Salem.—Ebenzer Steadman, Newburyport.—Hillard & Brown, Cambridge.—Ezra Collier, Plymouth.—E. & G. Merriam, West Brookfield.—Clayton Harris, Worcester.—A. S. Beckwith, Providence.—G. Thorburn & Son, No. 67 Liberty Street, New York—and by booksellers and traders generally.

Miscellaneous.

AN ENIGMA, said to have been written by Mr. Canning, which for a length of time baffled the skill of all England to solve.

"There is a word of plural number,
A foe to peace and human slumber.
Now any word you chance to take.
By adding S, you plural make;
But if you add an S to this,
How strange the metamorphosis
Plural, is plural then no more,
And sweet, what bitter was before."

Solution.—The word is *caves*, to which, by adding an S, you have *caress*.

From an English Magazine of 1776.

ANECDOTE OF VOLTAIRE.

This gentleman forgets all his infidelity on two occasions: viz. when he is sick and when it thunders and lightens. He is so particularly afraid of stormy weather, that if he happen to be writing when the "clouds pour down their torrents, and the air thunders, and the arrows of the Almighty flash abroad," he'll call out in an agony of horror, for a bottle of *holy water*, and sprinkle himself with it from head to foot; and plentifully bedew the floors and walls of his apartments into the bargain. Immediately after which precaution, he orders *mass* to be said in his chapel; and the masses go on briskly one after another, till the thunder and lightning cease. But, no sooner is the tempest hushed, than a clear sky and placid elements settle him into a laughing Infidel again, and resuming his pen, he writes against Christianity with as much acrimony, zeal and want of argument, as ever. This behaviour reminds us of the old Spanish proverb:

"When the Devil was sick,
The Devil a Monk would be,
But, when the Devil grew well,
The devil a Monk was he."

SPANISH PROVERBS.

This world is a field sowed for another life.
The most incurable disease is ignorance.
All secrets which pass beyond two make themselves known.

Prefer the day of to-day to that of to-morrow.
He who is of unknown origin is discovered by his works.

Where the heart is inclined there also will the feet turn.

Death is nearer to us than the eye-lid to the eye.

The little which suffices is better than the much which disturbs us.

The best of man's possessions is a sincere friend.

The eulogium made on the absent, serves to incline our hearts to the present.

The best of riches is contentment; the worst of poverty, low spirits.

Labor for this life as if thou wert to live forever; and for the other, as if thou wert to die to-morrow.

Desire not either the wise man or the fool for thy enemy; but guard thyself equally from the cunning of the wise man, and the ignorance of the fool.

The man who contents himself to-day with that which he has, will content himself to-morrow with that which he may have.

There is no to-morrow which cannot be converted into to-day.

He will never save himself who does not labor for his soul before the day of its destruction.

Softness of manners does not exclude firmness of character; thus the flexible cable resists the fury of the waves, and preserves from shipwreck.

Paddy's Ride on the Railway.—The Lehigh coal mines are situated on a mountain, about nine miles from a river, at an elevation of near 1000 feet above it. A rail road has been extended from the mines to the river, along the side of the mountain, down which the coal is conveyed in cars, which descend by their own weight. The velocity of their descent would be almost incredible, were it not for a regulating power, subject to the controul of the conductor of the cars. In addition to the coal cars, are others for carrying off the earth and rubbish with which the coal is covered. They are so constructed that, when they have descended near to the foot of the mountain, where the railway crosses a deep ravine, a catch on the side of the rail knocks out a pin, and lets the bottom of the car, which is hung on hinges, drop and discharge the contents into the abyss fifty or sixty feet below. A short time since, three Paddies, fresh from their own "swate Ireland," visited the place, and, while the workmen were at dinner, determined on having a ride. They accordingly got into one of the dirt cars and let it loose from the fastening. Not knowing how to regulate the velocity, away they went, Jehu like, at the rate of half a mile a minute. This was fine sport till, on a sudden, the bottom dropped and deposited them, without any material injury, among the rubbish below, from which they looked up, in unspeakeable consternation and dismay, at this unexpected termination of their ride.—*Worcester Spy.*

The English Language.—The difficulty of applying rules to the pronunciation of our language may be illustrated in two lines where the combination of the letters *ough* is pronounced in no less than seven different ways, viz. as *o, u, of, up, ou, oo, and ock.*

Though the tough enough and liecough plough me through,
O'er life's dark lough my course I still pursue.

A traveller on the Continent, visiting the Cathedral of——, was shown by the Sacristan, among other marvels, a dirty opaque glass phial. After eyeing it some time, the traveller said, "Do you call this a relic? Why it is empty." Euphy!" retorted the Sacristan, indignantly, "Sir, it contains some of the darkness that Moses spread over the land of Egypt!"

Eating Salads.—A lad, who had lately gone to service having had salad served to dinner, every day for a week, ran away; and when asked why he had left his place, he replied, "They made me eat grass i'th the summer, and I wur afraid they'd mak me eat hay i'th the winter; and could not stand that, so I wur off."

Conundrum.—The following, from the Albany Microscope, is a very clever conundrum—better than most puzzles of that description:
"Why is fortune like P? Because it makes an ass pass."

15000 yards of cotton cloth are made daily at Lowell.

Dreams.—To dream, and to remember your dream, is a forerunner that you were not awake nor very sound asleep, when you dreamed. To tell your dreams, prognosticates that you might be better employed. For a young lady to dream very particularly of any certain young gentleman, foretells that she purchased her last flat to attract his attention. To dream of happiness shows that you will probably be disappointed when you awake.

Signs.—To hear a death-watch, denotes that there is a little insect near you. To see strange sights is a sign that there is something to cause them, or that your head is disordered. To see an apparition or to be bewitched, is an incontestable evidence that you are lacking in common sense.

Wise men say nothing in dangerous times. The lion called the sheep to ask her if his breath was unpleasant: She said aye; and he bit off her head for a fool. He called the wolf and asked him: he said no; he tore him in pieces for a flatterer; at last he called the fox and asked him; "Truly," said the fox, "I have caught a cold and cannot tell."

Oh, my eye and Betty Martin!—Many of our most popular vulgarisms have their origin in some whimsical perversion of language or of fact. St. Martin is one of the worthies in the Romish calendar; and a form of prayer to him begins with these words, "*Oh, mihi beate Martine,*" which by some desperate fellow, who was more prone to punning than praying, has furnished the plebeian phrase so well known in the modern circles of horse laughter.

Great Sale of Wool.

On Tuesday the 16th of October, the day preceding the Brighton Fair, at 10 o'clock, at the Hall over the New Market, will be sold, at Public Auction, 218 bales of Saxony Wool, consisting of 1st and 2d Electoral—1st and 2d Prima Secunda—Tertia and Quarter.

100 bales Spanish Wool,
100 do. Portuguese do.
150 do. Smyrna do.

Also, 50,000 lbs. High Grade and Full Blood Fleeced Wool.

* The above Sale presents a favourable opportunity to growers and holders for disposing of their Wool, which will be ready at any time on or before the 10th proximo.

* Catalogues of the whole will be ready for delivery, and the Wool may be examined the day previous to the sale.

COOLIDGE, POOR & HEAD, Auc'rs.

Boston, Sept. 23, 1827.

Saxony Sheep.

On THURSDAY Oct. 18.....at 10 o'clock,
The day succeeding the Agricultural Fair,
At Brighton, (near Boston) the entire flock of Electoral Saxony Sheep, imported in the ship Mentor, Capt. Mann, from Hamburg, consisting of

161 EWES and 21 RAMS.

These Sheep were carefully selected by experienced agents for account of a highly respectable House in Leipsic, and will be found to excel any flock hitherto imported in regard to size and weight of fleece, while they are not inferior in any other particular. The large proportion of *Ewes*, of the finest quality, were not procured without much difficulty; and, in general, such measures were taken as to warrant the expectation that this flock will not suffer by the most rigid scrutiny of persons disposed to improve their stock by the introduction of *pure Saxony Blood*.

The Sheep may be examined at Brighton, at any time before the sale.

Catalogues will be ready for delivery at our office 20 days previous—when Samples of the Wool will be exhibited.

The Agent pledges himself that none of the Stock will be disposed of until the day of Auction, when they will all be sold without reserve.

COOLIDGE, POOR & HEAD.

Medical Lectures—Boston. TIME CHANGED.

Medical Lectures of Harvard College will begin the THIRD WEDNESDAY IN OCTOBER, at the Medical College, Mason street, Boston. The time having been changed from the THIRD WEDNESDAY IN NOVEMBER, when they formerly began.

Aug 21 1827. WALTER CHANNING,

Dean of the Medical Faculty.

The FARMER is published every Friday, at \$3.00 per annum, or \$2.50 if paid in advance.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

VOL. VI.

BOSTON, FRIDAY, OCTOBER 12, 1827.

No. 12.

HORTICULTURE.

FOR THE NEW ENGLAND FARMER.

Planting Acorns.—Mr. Miller advises to plant acorns as soon as they are ripe in October, which will come up in the following spring; because if they are attempted to be kept they will sprout, although spread thin. Others advise that the acorns be gathered as soon as they fall in autumn and kept in a box, or boxes of sand till the following spring; then to open them, and carefully plant those which are sprouted. But no time should be allowed for the sprouts to dry. Dr. Deane preferred the method last mentioned, and says, "I have tried that which is recommended by Mr. Miller without success." See also *Deane's New Eng. Farmer*, Art. Oak.

Useful knife board.—An English writer says, that a common knife-board, covered with thick buff leather, on which are put emery, one part, *crocus martis*, three parts in very fine powder, mixed into a thick paste with a little lard or sweet oil, and spread on the leather about the thickness of a shilling, gives a far superior edge and polish to knives, and will not wear the knife nearly so much as the common method of using brick-dust on board.

Mode of marking Sheep without injury to the wool. An English writer gives the following:—Mark on either side of the nose of the sheep, the initials of the owner's name, and on the opposite side any number by which he may choose to designate the particular sheep, by means of a small iron letter or figure about an inch long; which being dipped in common oil colours, mixed with turpentine to dry them more readily, is placed on the part described, and will continue until the next shearing season. The process is easy, and will give the animal no pain; the marks cannot be readily obliterated, which is not the case with tattooing or cauterizing.

Chapped or sore lips.—May be healed by the frequent application of honey water, and protecting them as much as possible from the influence of cold air.

Obstinate Ulcers.—May sometimes be cured with sugar dissolved in a strong decoction of walnut leaves.

GARLIC.

This vegetable, the *Allium Sativum*, is a plant with bulbous root, of irregular form, composed of many smaller bulbs, called cloves, which are all included within a white skin.

The stem leaves are flat and narrow; the upper part of the stem bears small bulbs, and the stem is three pointed.

In warm climates, where Garlic is produced with considerably less acrimony than Great Britain, it is much used, both as a seasoning and as food. The lower classes of French, Spaniards, and Portuguese, consume great quantities of it. The Jews also eat of it to excess. With us it is in considerable estimation for culinary and other domestic purposes. It has a very acrid taste, and

an highly offensive smell, which pervade the whole plant; and it differs from onion only by being more powerful in its effects. When bruised and applied to the skin, it causes inflammation, and raises blisters.

The medical properties of garlic are various. In drosical complaints, asthmas, and agues, it is said to have been successfully used. Some instances have occurred in deafness, of the beneficial effects of wrapping a clove of garlic in muslin and putting it into the ear. As a medicine internally taken, it is usually administered as a bolus, or made into pills. Its smell is considered an infallible remedy against vapours, and as useful in nearly all the nervous disorders to which females are subject. An oil is sometimes prepared from garlic, which is so heavy as to sink in water; but the virtues of this pungent vegetable are more perfectly and more readily extracted by spirit of wine than in any other way. A syrup also is made from it.

The juice of garlic is said to be the best and strongest cement that can be adopted for broken glass and china, leaving little or no mark, if used with care. Snails, worms, and the grubs or larvae of insects, as well as moles and other vermin, may all be driven away by placing preparations of garlic in or near their haunts.

CANADIAN, OR TREE ONION.

This vegetable (the *Allium Canadense* of Botanists) is remarkable for producing a bulb or onion at the top of the stalk.

The stem of this plant is naked and round; and the leaves are flat and narrow.

These onions are well deserving of attention, both as objects of curiosity from producing an onion upon the stalk, and also for their use. When pickled they are generally thought superior in flavor to the common onion.

They were originally imported from Canada; are perennial, and are propagated by planting the bulbs in the spring or autumn. Either the bulbs of the root or those on the stalk will grow.

BEES.

A late British paper says, Mr. James Boag, timber merchant, Johnstone, lately breaking up a log of American wood, about 24 feet in length and 28 inches square, discovered in the very centre of it a hollow, in which was a considerable number of bees, a quantity of honey, and a few larvae. The imprisoned insects were of a longer and more attenuated frame than the free tribes that roam over the hills and valleys of Great Britain. Every care was taken to preserve some of the interesting foreigners alive, but they all died in a short time after exposure to the influence of the atmosphere, hardly tasting the sweets of liberty till consigned to non-existence. The log contained several of these hollows of different dimensions, and in all of them a number of living bees.

Metallic Cloths.—At the late exhibition of the products of national industry at the Louvre in Paris, there was exhibited a waistcoat and several other articles made of metal wire, which are said in the report of the jury appointed to judge of their merits, to have been "equal to cambric fineness."

From the Poughkeepsie Journal.

SHEEP.

It seems to be generally agreed among the intelligent farmers in this country, that sheep are the most profitable stock a farmer can keep; and the prevalence of this opinion among the Dutchess county farmers, has induced them to increase their flocks, until they probably exceed in number the sheep to be found in any other district of the same extent in the United States. Mr. Everett of Boston, during the last session of Congress, in his speech on the woolens bill, estimated the whole number of sheep in the United States at 13,000,000. At the last census the returns of sheep in this county amounted to a fraction short of 350,000. It is estimated, by those best acquainted with the subject, that the increase since that period has swelled the number to at least 450,000. It will thus appear that Dutchess county, embracing a territory less than thirty by forty miles in extent, owns one twenty-ninth part of all the sheep in the United States.

Nor are the flocks of Dutchess less distinguished for the fineness of their fleeces than for the largeness of their numbers. In no part of the United States, we venture to say, has more care been taken to obtain the best sheep and insure the finest wool; nor do we believe there is any section of the union in which better wool is grown.

Persons who have paid most attention to the subject, and are therefore best qualified to judge correctly, are of opinion that the wool grown in Dutchess county the past year, besides what is manufactured in the families of the growers, is not less than 500,000 pounds, and that the average price may be set down at 40 cents. This will give the round sum of \$200,000, for the fleeces only, after deducting what is consumed in the various household manufactures, which probably amounts to more than half as much more. If to this be added another \$100,000 for the sales of store and fatted sheep and lambs, it presents a very imposing sum as the annual proceeds of sheep in the county. Until within the last ten years, the wool annually grown in Dutchess, did not, we presume, exceed the annual consumption of its inhabitants for household manufactures. Since that time, the increase of sheep has been very rapid, and if the value of this description of stock is fully understood and duly appreciated, they will continue to increase more rapidly than they have hitherto done.

What has been the effect of this large increase of sheep upon the other farming interests of the county? Has the quantity of grain, of butter and cheese, or of beef and pork annually sent to market from this county, decreased in consequence of the large increase of sheep? Not so. On the contrary, we are assured by those who have made it a subject of inquiry, that the quantity of grain has increased, and we have little doubt that the other items would be found on inquiry, to have increased also.

What then is the inference? Why, surely, that the county gains annually about 300,000 dollars, in consequence of its zealous attention to increasing the number and improving the quality of its sheep.

In proof of the substantial correctness of this view of the subject, we will descend from general estimates to particular cases, which have come to our knowledge.—A farm in this town of about three hundred acres had been managed till within the last few years without sheep. A few years since five hundred sheep were put on it. The same farmer has continued to manage it, and he now admits that he can keep the sheep and raise as much grain yearly as he could before the sheep were put on. The whole product of the sheep then, consisting of their wool and lambs, after allowing for the interest on their cost and the trouble of taking care of them, is clear profits. This is but one of many instances we could mention.

Those who have not considered the subject will doubtless be at a loss to understand all this. The explanation may be found in the tendency of sheep to enrich the soil, by the manure which they scatter over the ground, and which in a few years restores the most worn-out and barren fields to a high state of fertility.

FOR THE NEW ENGLAND FARMER.

Linnæan Botanic Garden, near /
near New York, Oct. 9, 1827. 5

NEW PLUM.

MR EDITOR—I annex a description of a very valuable plum, extracted from my "Short Treatise on Horticulture" now in press.

Hulings' Superb.—This plum, I have little hesitation in saying, is the largest known either in Europe or America. The largest white or yellow plum in Europe, as far as my information extends, is the Yellow Egg, or White Magnum Bonum, which is an oval fruit; and the largest red or purple plums, are the Imperial Violet, Jerusalem, and some of the prunes. The *Hulings' Superb* I received from Dr William E. Hulings, of Pennsylvania, a gentleman distinguished as much for his zeal and perspicuity in the introduction of new and valuable fruits to proper notice, as for the extreme liberality evinced in their dissemination to others. To that gentleman I am indebted for the following remarks:—"I have had a fully ripe and delicious plum from my tree, weighing three ounces and seventy eight grains, and measuring round 6 inches and seven-tenths." I saw the fruit of this tree, which stands immediately beside a Washington or Bolmer plum, and it was decidedly the largest of the two. The fruit is of a roundish form and greenish colour, bearing an affinity to the Gage, from which it doubtless originated. Were I to venture a supposition as to its parentage, I should suppose it to have originated from the Green Gage, impregnated by the White Magnum Bonum. It is three years since I began to cultivate it, and I have already sent a number to different parts of the Union, and several hundred are now in the Nurseries. In a more recent letter from Dr H. he remarks, that this plum "is very fine flavoured and sweet, and the first in rank among plums"—in which opinion I fully concur; its present title was given to it by me in honour of that gentleman.

Yours most respectfully,

WILLIAM PRINCE.

POTATOES.

MR EDITOR.—Mr Eliphalet Thayer of Dorchester, digging his potatoes a few days since, and finding them large and abundant, had the curiosity to weigh one of the largest hills, and found it to

contain 31 large potatoes, and to weigh 15 pounds. The largest potato weighed 2½ lbs, and four of the next largest in size weighed 6½ lbs. The potatoes were of the common white sort, and planted without manure in the hill, the manure being spread on the ground, which was a dry, loamy soil. The same seed he has continued to plant for several years past, but it may not be amiss to observe (indeed, it is the principal object of this communication) that *Mr Thayer has always been very careful to select the best potatoes for seed*, a circumstance that many farmers do not sufficiently attend to.—I will here take the opportunity to remark, that the practical observations of Mr Thayer, on many subjects that regard agriculture, particularly with regard to the Borer, are such as would, I think, if communicated, very essentially contribute to the advancement of agricultural knowledge.

HARTFORD CATTLE SHOW AND FAIR.

The tenth annual Cattle Show and Fair of the Hartford County Agricultural Society was held in Hartford on Wednesday and Thursday last. Serious apprehensions were entertained by many friends of the society, that the unfavorable state of the weather, the day previous, would deprive this anniversary of much of its usual interest. But we are gratified to state, that these apprehensions were far from being realized. Notwithstanding the severe storm on Tuesday, which rendered it impracticable for members residing in remote parts of the county to bring forward their stock and domestic fabrics for inspection, the exhibition was on the whole not less extensive, or less honorable to the society than in any former year; and judging from what was actually accomplished under the unfavorable circumstances of the occasion, we have no doubt that had the weather been pleasant, this anniversary would have been distinguished by a much more numerous collection of animals, and a greater variety of Domestic manufactures, than any preceding one since the organisation of the society. As it was, the members of the society had abundant cause to congratulate themselves on the result of their exertions the past year, and great encouragement to persevere in their efforts to advance the interest of the important cause in which they have engaged.—The Reports of the different Committees render it unnecessary for us to enter minutely into details in this place; our remarks on the different parts of the exhibition will therefore be general.

The proceedings on both days of the Fair took place in the order already published.—The arrangements were judicious, and much credit is due to those gentlemen by whose assistance they were carried into effect.—Wednesday was devoted to the inspection of stock and domestic manufactures, the ploughing match and auction sales. The number of animals exhibited on the South Green, did not vary essentially from last year, but in the opinion of the committee who inspected them, they afforded indications of a gradual but decided improvement in this important department. Besides those inspected by the committees, there were several animals not entitled to a premium by the rules of the society, which were exhibited by the owners, and added not a little to the interest of the exhibition. Among them were the valuable bull *Wye Comet*, owned by Messrs. H. Watson and W. Woodbridge, which received the premium last year; the fine grey horse *Highlander*, owned by Mr John Watson; and one of his colts, a beau-

tiful animal owned by Mr Samuel Thompson of Ellington. Much credit is due to those gentlemen, who without any reference to a premium are in this way willing to lend their exertions to promote the important objects of the society. We most not here forget to mention the large Cart belonging to Mr D. Grant of Windsor, containing one hundred bushels of winter apples, together with a great variety of unusually large and excellent vegetables, drawn by a team of 12 yoke of oxen all belonging to the same gentleman. The contents of the cart were disposed of at auction.

At the Ploughing Match there were five competitors for the premiums, and those who are judges in such matters, do not hesitate to say the work generally was performed in a much better style than usual.

The exhibition of Manufactures at the State House was in many respects superior to that of last year; and we hope there will hereafter be no cause to lament any deficiency in this department—were there no other inducement, we should think the liberal prices obtained at the auction sales of the articles offered for premiums, would be sufficient to insure an extensive exhibition. Mr George Putnam, who rendered his services gratuitously on the occasion, was engaged from four o'clock till dark, in selling at auction the various articles which the owners chose to dispose of in this way, and we presume the prices obtained were generally satisfactory. The premium Butter sold at 19 and 20 cents per pound. Cheese at 12 1-2 and 13 cents. Flannels from 75 to 90 cents, and other articles in proportion. Several articles discovering much ingenuity in the makers, though not regularly entitled to a premium, were exhibited, and attracted general attention. Among them was a curious machine for gathering apples.

At ten o'clock on Thursday, the members of the society proceeded to the south church, where religious exercises were performed by the Rev. Mr Linsley, and an address delivered by Professor Hall, of Washington College. This performance was such as was expected from the reputation of the author; it was listened to with silent and respectful attention, and constituted no small part of the entertainment of this interesting anniversary.

After the exercises at the church were concluded, the society returned to the State House, where the remainder of the forenoon was occupied in hearing the Reports of the different committees. In the afternoon the premiums were awarded to the successful competitors, and the officers elected for the ensuing year.

To the Hartford County Agricultural Society, Your Viewing Committee respectfully Report,

That nine farms were this year entered for premiums; eight of them were viewed and one withdrawn.

Capt David Grant's farm at Wintonbury, contains about 230 acres of improved land. Last year he received the society's second premium for this farm.

For a number of years this farm has been managed in a skillful and systematic manner. It is conveniently divided and well fenced with the best of fence—great attention is given to making manure, and by his swine an abundant supply is now made on the farm; with a thorough use of the plough and a well directed application of manure a handsome income is realized by the proprietor.

The farm of Calvin Barber, Esq. in Simsbury, contains about 110 acres of land improved. For this farm he received the society's third premium in 1825.

Great pains have been taken by Mr Barber to eradicate bushes and weeds, and he has, by ditching, successfully reclaimed a number of acres of cold swamp land, that was useless before he commenced his operation.

The mountain farm of Mr. Preserved Marshall in the north part of Farmington, received the society's 2d premium in 1825, and contains about 50 acres. This farm during the last year, has received additional improvements, and by the large crops of hay he has unquestionably been fully remunerated for all his improvements.

The farm of Mr. Aaron Goodman, in West Hartford contains about 47 acres of cultivated land and was viewed by your committee last year.

This farm is managed in such a manner, that the proprietor receives from his lands a rich reward for his labor.

The farm of Ward Woodbridge, Esq. in West Hartford, contains 92 acres. For this farm the proprietor had awarded to him last year, the Society's 3d premium.

The views of Mr. Woodbridge appear to be those of reason and experience, viz. to give to the soil a liberal return for its products.

By the good management and perseverance of the tenant, Mr. Tuller, this farm has received lasting improvements. The closest attention is paid to economical and neat husbandry.

Mr. Albigeance Scarborough has the last year commenced a system of improvement on his farm of about 120 acres, worthy of imitation.

The greatest part of his farm is naturally of a good soil; this he has benefited by the use of the plough and manure. Between the public road and his house, were a number of barren sand knolls, interspersed with frog ponds. From the ponds he has opened drains, and has taken from their bottoms the mud and decomposed vegetable matter, and spread it upon the knolls, and scraped sand from the knolls into the pond holes; and in this manner has converted both sand knolls and frog ponds into good land for cultivation, and greatly improved the whole appearance of his farm. From the public road to his house, which stands in about the centre of his farm, he has opened and made an excellent road. This farm is judiciously divided into fields, with excellent fences.

The farm of Mr. Harvey Marshall, in Hartford, was viewed by your committee last year, and contains 38 acres. Mr Marshall has 14 acres of wood-land in Farmington. By the application of large quantities of manure as a top dressing, before and after a thorough use of the harrow, large crops of hay have been obtained from land that was formerly pasture.

The farm of Mr. Samuel Bartlett, in the north east part of East-Windsor, contains about 430 acres of land under cultivation. A great proportion of this farm is appropriated to the raising of grain. From 60 to 75 acres are annually in rye, and about 25 to 30 acres to corn. After a crop of rye, his fields are pastured from four to six years, and then fallowed for another crop. Under this method of cultivation, his lands produce good feed, excellent crops, and the soil gradually improves. A portion of this large farm is a permanent meadow, that is annually overflowed; this, with some highly cultivated land adjoining his house and

barn, enables him to cut hay sufficient to winter about 60 head of cattle and horses. This farm was formerly divided into fields, by ditches and broad hedges. They are all removed, and in the place they formerly occupied we found a smooth surface and substantial fences.

Great attention has been paid by Mr. Bartlett to improve his stock of Cattle, and we think he has been very successful. We observed more fine improved stock on this Farm than on any other.

It may by some be said that they cannot afford to hire labourers, make good fences, or purchase manure to make improvements on their Farms. To those we respectfully reply, that we think that if the labour and manure are judiciously applied, and the fences properly made, that the capital invested for those purposes would be a much more profitable investment than it is to invest (as most of us do,) our capital in the purchase of lands to increase the size of our Farms. Others may say that with capital any man can make his Farm appear well; but they may be assured skill and attention are as necessary as capital, and when these are wanting, capital will soon be lost in farming.

Skill, capital, industry, and economy combined, are necessary for a Farmer to make his Farm profitable.

The applicants for premiums will please accept the most grateful thanks of your Viewing Committee, for the polite and hospitable treatment they received while attending to the duties assigned them.

By order of the Viewing Committee,
HENRY WATSON, Chairman.
Hartford, Oct. 4. 1827.

The award on Farms was as follows:
To Ward Woodbridge, of Hartford, for the best cultivated Farm, a silver cup, valued at \$30
To Calvin Barber, of Simsbury, for the second best do \$20
To Albigeance Scarborough, of Hartford, for the third best do 10

REWARD OF INGENUITY.

Mr. Thornton of the Patent Office, Washington, relates the following anecdote.

Mr. Gilbert Brewster, a very ingenious artist from Connecticut, came to the Patent Office about the middle of October, 1823, and requested permission to examine the models. I informed him they were deposited for public inspection, and that he was at liberty to see and examine them as often and as long as he pleased. Instead of spending a few hours, he visited them daily for about six weeks; then thanked me for the gratification he had enjoyed, declaring them worth a thousand dollars, or that they were of incalculable value to the real mechanic. He said he saw movements and combinations of which he had before no idea, and that he was now enabled so to improve the machinery for spinning wool, as to reduce the price from eight cents to one cent per pound. He went away and returned in about three months, with two models, declaring on his return, that he had perfected what he had contemplated, and that he could then spin wool at a lower price than the English, who could not effect it for less than four cents per pound. I issued three patents for his machines, and a gentleman who accompanied him from New-York, and who had engaged to buy these machines for a manufacturing company in

Connecticut, laid him down ten thousand dollars in my presence.

SUNFLOWER.

An account was given, a short time since, of a gigantic sunflower in New York. The length of the stalk was twelve feet, and the disc of the largest flower four feet in circumference. We saw last week in the garden of a gentleman in Deer field, several flowers of this species of an uncommon size. Of one, the stalk measured fourteen feet in length; on another stalk a leaf measured eighteen inches in its shortest diameter, or between the extremities of the lobes, and the diameter of a flower, accurately measured, was seven-teen inches, giving a circumference of four feet and three inches. This valuable plant deserves to be more extensively cultivated than it is. Its leaves are said to furnish a good fodder for horses. The seeds are eaten with avidity by horses, pigs and sheep, and for poultry no grain is so valuable. It is said that poultry fed upon these seeds will lay a greater number of eggs than those fed in any other manner; besides this, a valuable oil is obtained from them, and the stalks, when burnt form a considerable quantity of alkaline manure.

Hamp. Post.

Muscadine wine.—A gentleman of Lauderdale county, Alabama, made the last season, a considerable quantity of Wine from the Muscadine, or Muscadine Grape, which he says resembles in flavor and in color, the best Madeira wine, and which he believes, only wants age, to render it as fine as any wine he ever drank. Muscadines grow indigenously, pretty plentifully, on and near the banks of most all the rivers and creeks of North Carolina; and it might be worth the while of some of our enterprising citizens, to make an experiment in manufacturing a wine from them, such vast quantities of which are imported from abroad, and consumed among us. If we pretend to render ourselves independent of foreign nations, let us not stop half way—but manufacture our *drinks*, as well as our *food and raiment*.

A delicate Soup.—There is no disputing about tastes.—The Indians consider rattlesnakes as choice morceaux. The Persians eat horses; the Frenchmen, frogs; the Russians, tallow candles; and the Americans, bears.—We have learned from geographies, that the Chinese made soup of birds' nests, but we had no idea, until lately, that they were esteemed such luxuries as to be sold for their weight in gold. We should as soon think of making soup of birds' feathers as of birds' nests. Still it may be very fine.—*Salem Obs.*

When the English and French were disputing as to their respective rights to certain territories in America, Voltaire happily remarked that they were quite agreed upon only one point, viz: that the real owners, (the natives) had no right at all to the lands in question.

In 1760 the Cotton Goods manufactured in England amounted in value to only £200,000.—In 1824, to £33,000,000.

A Jail to Let.—The jail of York, (Penn.) has not a single tenant at the present time, either for debt or crime. This fact may be set down as one of the favourable "signs of the times."

STRAFFORD COPPERAS WORKS.

Nine miles north of Norwich, Vermont, on the side of a hill, are situated the Strafford Copperas Works. The soil of the hill is thin, and covers an immense quantity of massive pyrites. Immediately above the pyritous rock, is found an incrustation of ferruginous earth, mixed with petrifications of leaves, nuts, &c. The rock is fossil and undergoes the following process, in order to be converted into copperas:

It is first broken into small pieces and thrown into large heaps, in which situation it is allowed to remain for some months; during which time, the sulphur with which the rock is strongly impregnated, is partially expelled, and the pieces of rock become completely pulverised, or disintegrated. The smell of sulphur is very powerful, and the surrounding objects are covered with a sulphurous dust. This process of expelling the sulphur and pulverising the mass of pyritous rock, is very similar to that of slacking lime, heat being produced in the same manner. From these heaps the pyrites are thrown upon leaches, and the lye drawn into leaden vats. Lead is used in the construction of the vats because other metals are liable to decomposition from the action of the liquid. In these vats the lye becomes reduced to a proper degree of strength, when it is conveyed into wooden vats and left to form crystals of copperas upon the sides or upon boughs thrown in for the purpose. The form of the crystals is rhombic, and the colour a beautiful green. The works are owned by a company in Boston, and have been in operation for many years, though they have been made more extensive lately. The quality of the copperas is very good, and it is generally used through the country, nearly ten thousand tons being annually sent to the market from Strafford.

AGRICULTURAL.

The last number of Flint's Western Review contains some sketches of the natural history of the Mississippi valley. He states that the wild rice is found in the greatest abundance, in the swamps on the upper courses of the Mississippi. It is a tall, tabular, reedy, and annual water plant, and resembles the cane grass of the swamps bordering on the gulph of Mexico. Its leaves and spikes, though much larger in other respects, resemble those of oats. The savages and Canadian hunters obtain from it their winter supply of grain. Mr. Flint thinks it might be cultivated with success in any part of the Atlantic country, where there are ponds and marshes. He has tasted it, and pronounces it not inferior to Sagó.

He also notices the Reed Cane, and the excellent fodder it furnishes for cattle. The butter that is made from the cane pastures, is of the finest quality and flavour. He has no doubt that it would grow as rapidly in Massachusetts, in the intervals between the frosts, as it does in Louisiana. Its seed could be annually obtained with little trouble, by our northern farmers. These hints are worthy of notice, and we hope there will be found among our agriculturalists, some who will have a curiosity to try the experiment. The expense would be very trifling.—*Salem Obs.*

Much excellent iron ore is found in the counties of South Carolina, bordering on North Carolina. Several furnaces have been erected, and hollow ware of a very substantial, if not of a very neat quality is made.

From the United States Gazette.

Having been privy to a large sale of indigo lately, I have gained some little information about this commodity, which I send you, to be used as your editorial wisdom may direct.

INDIGO.—The chief sign of good indigo, is its *lightness and feeling dry* between the fingers; its *swimming on water*. If thrown upon burning coals, it emits a violet coloured smoke, leaving but little ashes behind.

In choosing indigo, the large regular formed cakes should be preferred, of a fine rich blue colour, extremely free from the white adhesive mould, and of a clean neat shape, as it is much depreciated in consequence of an irregular shape in the cakes, and the incrustation of white mould—when broken, it should be of a bright purple cast, of a loose and compact texture, free from white specks or sand; and when rubbed with the nail, should have a beautiful shining copper-like appearance. That which is heavy, dull coloured and porous, should be rejected—also, the small and broken pieces, which though equally good in quality, do not obtain an equal price.

USE OF TOBACCO.

GENTLEMEN: I observed in your paper, some days ago, a notice that a person had discovered a cure for the use of Tobacco. I have suffered under a pulmonary complaint two years and a half: about the first of July last I was very feeble, when a friend advised me to use *Slippery Elm Bark*, as a substitute for Tobacco, observing that I would swallow the juice or spittle, which would be of benefit to the lungs. I immediately commenced using it; and what has been very surprising to me, from that day to this I never had the least desire for Tobacco, although I had used it for upwards of twenty-five years. I cannot use it now if I would: it is perfectly nauseous to me. I have tried the experiment a few times, by putting some in my mouth, and have been compelled to throw it out almost immediately. I do not know that the Bark would have the same happy effect on others that it has had on me; but I would advise every gentleman to try this experiment, who is desirous to break a habit that is useless and expensive.—It is expensive because the use of Tobacco creates thirst, and generally a thirst for something *stronger than water*. Respectfully yours, J. B.—*National Intelligencer.*

GOOD FARMING.

There is a farmer in the town of Louisville, in this county, who has had a harvest this year of more than six hundred acres of produce. The following are some of the items:—upwards of two hundred acres of wheat; one hundred acres of rye; eighty acres of corn; fifty acres of potatoes; sixty acres of oats; thirty of peas, together with barley, &c. &c. The number of men employed during harvest was thirty; all the grain was very fine and well secured. This same farmer has one hundred horses, which he is raising for market. There are several farmers at the West, who keep more stock and cattle and cut more hay, but we doubt if there are any who can boast of a greater harvest of grain.—*St. Louis, N. S. Gazette.*

Peaches have been selling in Stonington, Conn. at six pence per basket.

THAMES TUNNEL.

It is observed that it will hardly be credited that so large a leak as there was in this work could have been so promptly remedied. It was at one time *fifty feet* wide. There are several trifling leaks in the sides, but these are not expected to cause trouble.

Weekly consumption of articles upon the work.—Bricks, 70,000. Cement, 350 casks. Candles, 300 pounds. Portable gas, 500 feet.

750 tons of soil were carted in to stop the leak. Before the accident, 3 or 400 dollars a day were taken from visitors.

It is stated that in the single city of Buenos Ayres there are already six thousand Frenchmen, and the number is said to be increasing.

Whether Beans and Peas, or Oats are preferable in respect to Economy, as provender for horses.—A bushel of oats weighs, perhaps, forty pounds, and a bushel of peas and beans perhaps sixty pounds; and as the skin of peas and beans is much less in quantity than that of oats, I suppose there may be fifteen pounds of flour more in a bushel of peas and beans, than in a bushel of oats. There is also reason to believe that the flour of beans is more nutritive than that of oats, as appears in the fattening of hogs; whence, according to the respective prices of these articles, peas and beans generally supply a cheaper provender for horses than oats, as well as for other domestic animals. But as the flour of peas and beans is more oily than that of oats, it may in general be somewhat more difficult of digestion, hence it may be found expedient to mix finely cut straw with them.

Mode of Stopping Epistaxes, (bleeding at the nose).—“A young man nineteen years of age, bled from the nose two days so profusely that he fainted several times. Mineral acids, ice to the nape of the neck, &c. were tried, but without stopping the flow of blood. Dr. Brunner was called in on the third day, and he blew up powdered gum Arabic through a quill—the hemorrhage ceased directly.”—*Philadelphia Journal of the Medical and Physical Sciences.*

Superior Bunsns.—One pound and a half of flour, (a quarter pound left to sift in last) and a half pound of butter cut up fine together; then add four eggs beat to a high froth, four tea cups of milk, half a wine glass of brandy, wine, and rose water each, and one wine glass of yeast: stir it all together with a knife, and add half a pound of sugar, then sift in the quarter of a pound of flour, and when the lumps are all beaten fine, set them to rise in pans they are to be baked in. This quantity will make four square pans full.

To preserve Grapes on the vines till winter.—About September, when the grapes are nearly ripe, procure some bags made either of crape, muslin or white paper.

Select some of the best branches, and with a pair of sharp narrow-pointed scissors, cut off all small, unripe, rotten, mouldy, or imperfect grapes, especially those eaten by the flies or wasps.

Incise each bunch in a bag, and tie the bag fast with a string, so that no insect can get into it. In the middle of a fine day in October, gather them, with a piece of the shoot to them, and hang them up in a dry warm room.

Dip the ends of the shoots in melted resin or

sealing-wax. Examine them frequently, lest they should get moulds or rotten.

SOUND.

"So strong is the upward propagation of sound, that, in an aerostatic balloon, the barking of dogs may sometimes be heard, at the height of three thousand toises," or nineteen thousand one hundred and eighty three English feet.

[*Humboldt's Travels.*]

THE CUCULLIA.

This insect abounds on the island of Cuba. It is a very curious fire fly, which, as the rainy season approaches, kindles a thousand brilliant little fires in the evening air. It has two strong lights, on each side of the upper part of the head, and one beneath the abdomen, and when fully grown, is about three fourths of an inch in length. Two or three of these will enable one to read in the darkest night.—*Missionary Herald.*

THE CHAMELION.

Dr Clarke tells us, that he caught a Chamelion in Egypt; kept it a considerable time; that it was of a vivid green when caught; that, afterwards, its ordinary colour was that of a common lizard; that, as it became unhealthy, it lost the power of changing its colour; that this change is seldom rapid; that it seems always to be the result of sudden apprehension; that, being defenceless, it gradually assumes the colour of the substance on which it presses, and is thus provided, by nature, with the means of concealment.

[*Clarke's Travels.*]

RHODE ISLAND.

Although Rhode Island is such a queer little ill-shapen state, it has the heart, and soul, and energy of a giant. Although it is neither fifty miles long nor thirty broad, yet it has more banks than towns, all sound and healthy, and about one hundred cotton manufactories, besides establishments for other branches of American industry, many of which are extensive. They are all in active operation, and so flourishing and profitable, that new ones are continually going up, and the capitalists of Rhode Island have large interests in similar establishments in Connecticut and Massachusetts. A large brick manufactory is building in Providence, to be driven by steam; one main design of which is the employment of the poor of that rapidly increasing city.—*N. Y. Commercial Adv.*

PAWTUNET (R. I.) CATTLE SHOW.

Wednesday and Thursday the Rhode Island Society held its annual Show and Fair. The violent rains on Tuesday, and the unpleasant weather which continued until Wednesday noon, interfered very much with the arrangements, and deterred many persons from bringing their stock and other articles. Nevertheless the pens were pretty well filled, some of them containing very fine animals, and though the number was not as great as last year, there was thought by good judges, to be a decided improvement in the quality. Perhaps diminution in the number of animals brought to the show, is a natural consequence of improvement in the breed and excellence of those presented. The more fine animals there are, the less inducement is there to put inferior ones into the pens. It is undoubtedly more to the credit of the exhibition to furnish a smaller number of the best specimens of the different breeds, than it would be to collect a herd of animals no better than could

be found grazing on any farm in the state selected indiscriminately. The stock consisted of seven bulls, (two or three fine animals of the Helderness breed,) four fat oxen, four pairs of steers, three heifers, ten calves, nearly all of them fine animals. [The improvement in this part of the stock was more perceptible than in any other, an evidence of the good effect the Society have produced in inducing our farmers to give particular attention to raising fine neat cattle.] There were a number of cows, one an Alderney, imported in 1826, a breed much esteemed for the quality of its milk: this cow was accompanied by her calf, 11 weeks old. There were two other cows of the old Durham breed, in excellent order. Both these cows had calves. The above comprised the best portion of the neat stock. Of sheep there were four merino bucks and four lambs.—The swine were not numerous, though very good specimens. A litter of eight pigs seven months old, attracted general observation. The high premium offered for the best horse had a good effect. Three noble animals were presented. One of them a two year old colt, raised by Mr. Edmund Brownell, of Little Compton, was as fine a horse of the age as has ever been seen in this state. He was sired by a colt of the famous Eclipse, his dam sired by Lynce. The best judges of this most noble of all domestic animals, awarded him unequalled praise. There was also a very pretty, spirited two year old colt, belonging to General Knight of Cranston. The working cattle, of which there were sixteen yokes, were the best ever exhibited in this state. Their appearance indicated much attention to cleanliness, a duty too much neglected in general by farmers toward these patient and useful instruments of agricultural labour. The products of the Dairy, presented for exhibition, were excellent, the butter particularly, of which there were nine large lots. There was also an abundance of good cheese. Mr. Robert Crandall, of Exeter, sent from his dairy a lot of 900 weight. The shop manufactures were few in number and not remarkable. There were other specimens of agricultural products, deserving notice. Among them was a fine cluster of three pears on one stem, produced by Dr. Caleb Fiske of Scituate, by budding on a quince stalk in 1824.

At nine o'clock on Wednesday morning, the Society met for business. The following persons were elected officers. JAMES RHODES, *President*—Samuel Slater, James D Wolf and Charles Eldridge, *Vice Presidents*: William Rhodes, *Treasurer*; John Brown Francis, *Secretary*; Jesse Tourtellot, Duty Arnold, Christopher Rhodes, Albert C. Green, Thomas Buffum, Jr, Jeremiah Thurston, Nathan Bowen, Charles Dyer, John Jencks, Stephen T. Northam, Wilbour Kelley, Stephen H. Smith, George W. Tillinghast, Asher Robbins, W. E. Richmond, Thomas Fry, George Irish, Moses B. Ives, Palemon Wolcott, Bates Harris, John Foster, Stephen Waterman, James Anthony, Joel Aldrich, John Pitman, Jeremiah Whipple, William Anthony, and Thomas Holden, *Standing Committee*.

A vote passed, by which each life member who has paid \$5 on admission, was entitled to receive one volume of the NEW ENGLAND FARMER. It was voted that any officer of the Society, or member of the standing Committee, who shall not attend one meeting of the Committee, for the year during which he may be elected, shall be considered in-

eligible at the next annual meeting, unless satisfactory excuse is rendered.

Messrs. John Pitman, Thomas Buffum, and J. B. Francis, were appointed a Committee to examine the Charter of the Society, to ascertain if any alterations therein be, in their opinion, desirable, to report at the next meeting.

At one o'clock the Society repaired to Aborn's Inn and partook of dinner. The number that sat down to the table, though smaller than usual, were enabled, from the continuance of the rain, which protracted their sitting, to participate in a variety of sentiments moderately drunk on the occasion.

At half past three o'clock, the weather having become pleasant, the ploughing match was commenced. Fifteen fine yokes of cattle were entered, all the ploughs except one, which was without a driver, having a driver and one team each. The ground was rather irregular sward, laid out in lots of one eighth of an acre, eight bouts being required to be performed by each competitor. The match was conducted with great spirit, and in a very handsome manner, there being but very few instances of an improper urging of the cattle beyond their natural speed. The shortest time in which the work was accomplished was 15 minutes, though there was in that instance, unfair urging of the oxen towards the close. Three others came out, with little difference between them, in fifteen minutes and a half. The longest time consumed was twenty minutes. The ploughing as was said by good judges, was uncommonly well done.—Much interest was excited for the individual who was without a driver. He scarcely touched his oxen, and did his work, in a steady, thorough manner, that showed he understood his business. He came out the last except one, but we question if there was a lot on the ground better ploughed than his. The interest the ploughmen and drivers took in the match was very animated, though the patient, sluggish ox, trudged on entirely heedless of the stake depending on his industry. It is quite provoking on such an occasion, to see the total want of emulation among these animals.

Yesterday the day was fine, and great numbers attended the Fair. At about 11 o'clock, the premiums were announced from the Balcony of the Hall, a large and brilliant collection of ladies being collected in the Hall and a crowd of men in front of the Balcony. About 3, P. M. the sale of premium articles commenced, and was conducted with spirit, particularly owing to the liberality of the numerous ladies present. The articles of comfort, utility and taste, presented by females for exhibition, were very excellent and elegant, and of great variety. The laces were most delicately wrought. A superb lace veil by Miss Cady, was not equalled by any other specimen. The work from the Newport school showed a very great improvement in lightness and finish. A black robe, and several black veils were superior to any English lace we ever saw. A specimen of a new style of stamping the figure on bobbinet, preparatory to working the lace, was exhibited from the Newport School.

The dairy articles sold extremely well. *The best lot of butter brought \$1 03 per lb!*

The following abstract of the several reports comprises nearly all the premiums awarded.

The Committee on Agricultural products awarded the following premiums.

To Wm. Smith, of Johnston, 1st premium,

cheese, \$8. Arnold Ellis, 2d do. \$6. Robert Crandall, Exeter, 3d do. a vol. N. E. Farmer, \$5. Earl Baker, 4th do. a vol. N. E. Farmer.

Butter. William Smith, 1st premium, \$8. For five other specimens, 1 vol. N. E. Farmer, and \$4 each to Allen Ellis, Joseph Slocum, John Stratton, Jossee Tourtellot, and Thomas B. Bowen. Earl Baker, on cider, (there were but four competitors) \$4. Edward Barnes on celery, \$2.

The committee speak in very high terms of the specimens of the dairy. Premiums on agricultural experiments, &c. will be awarded in December next, by the standing committee. A specimen of wine, from the native Fox grape, by James Brown, was highly approved. Specimens of valuable peat from an inexhaustible source, in the vicinity of Pawtuxet, were presented by the Duck Pond fuel association.

Ploughing Match.—The committee on the ploughing, report, that there were fifteen competitors. There was in their opinion, a general improvement in the style of the work and the management of the teams, from that observed any previous year. They award the following premiums.

To Joseph Sheldon, of Cranston, first premium, \$10.00.

To Bartlett & Perry, tenants on the farm of the late Thomas Arnold, the second premium of \$8.00

[This was the team, without a driver, for which a great interest was excited during the match. They were the least worried of any team on the ground. Mr. Edward Perry held the plough, and received two dollars in addition.]

To Bates Harris of Cranston, the third premium, of \$6.00.

To Elisha Olney of Smithfield, the fourth premium, of \$4.00

To the ploughmen and drivers to the above teams, each \$1.00

To Allen Ellis, Elisha Whitaker, Wm. Johnson, Sterry Jenckes, Sheldon Knight, Christopher Knight, Olney Williams and H. Smith, one Vol. of the N. E. Farmer. [It will be seen that Cranston, as usual has carried off the palm in ploughing and working cattle.]

WORKING CATTLE.—The committee award to Joseph Sheldon of Cranston, for best pair of working cattle, a N. E. Farmer and \$1.00

To Abner Sprague of Cranston, for the second best, a N. E. Farmer, and \$1.00

To Bates Harris of Cranston, third do. do. do.

NEAT STOCK.—Allen Ellis of Scituate, best native Bull, the 1st premium of \$15.00
 Samuel G. Arnold of Providence, next best do. \$10.00

Abner Sprague of Cranston, next best do. \$8.00

Simon Whipple, Smithfield, best bull calf (an animal of great beauty) \$5.00.

Nathaniel Mowry, Smithfield, next do. do. a N. E. Farmer, and \$1.00

Duty Arnold, Warwick, next best do. a New England Farmer.

Jonathan Brownell, Little Compton, best half blood Bull, being half Holderness, \$10

Simon Whipple best cow, \$10

Nathaniel Mowry, Smithfield 2d do. \$8

Nathaniel Bump, Providence, 3d do. \$2

Thomas R. Greene, Pawtuxet, 4th do. New England Farmer.

Frederick Durfee, best heifer \$6
 Bates Harris, Cranston, next do. a New England Farmer and \$1

Abner Sprague, Cranston, next do. a New England Farmer.

John Jenckes, Smithfield, best heifer calf \$5
 George Smith, Smithfield, for second and third best. \$1 and a vol. of New England Farmer.

Reuben Jenckes, Cumberland, best fattened ox \$10
 Thomas Mathewson, Gloucester, next best \$6

Isaac Field, Scituate, 3d do. a vol. and \$1

Elisha Olney, Smithfield, best 3 yr old steers \$6

Thomas Brayton, Cranston, next, a vol. and \$1

I Field, Scituate, best 2 year old steers, \$5

Samuel Bullock, Cranston, next best, a vol. & \$1

No bull of foreign breed was entered.

Several bulls and other neat stock, possessing excellent qualities, which had before received premiums, were presented merely for exhibition.

Among them the fine short horned Bull belonging to Philip Martin.

MILL MANUFACTURES.

To William Sprague of Cranston, on Calico \$15
 E. & J. Davis, N. Kingstown, on Broadcloth, \$6

Jos. Cunliff, North Providence, Bed ticking \$3

[It is to be regretted that any premiums are offered for Mill Manufactures, as the very few articles exhibited may give rise abroad to an incorrect estimate of the importance and success of this branch of industry in R. I. The above specimens were the best of the kind, particularly the bed ticking. Unless the manufacturers will come forward more generally, the sum devoted to this department, may probably be much better applied elsewhere.]

SHEEP AND SWINE.

To Allen Ellis for Merino Buck \$10
 Thomas Buffum, the second and third premium for Merino Bucks, \$6, and 1, and a vol. of New England Farmer.

Allen Ellis, best boar, \$7
 Calvin Dean, next best \$8

John Pettis, next best, a vol. of New England Farmer.

Allen Ellis, two pigs, \$6, for a litter of eight pigs, \$1 and a vol. of New England Farmer.

A fine Spanish boar, presented last year to the Society by Capt. Creighton, and a Tunisian ram, belonging to Capt. C. were exhibited for inspection.

HORSES.

The Committee on horses, report, that they are unanimously of opinion that the horse Young Eclipse, owned by Edmund Brownell, is entitled to the Society's premium of \$50. There were several fine horses exhibited, and it would have been gratifying to the Committee to have noticed them in a manner suited to their several merits but as your Committee had it in their power to award but one premium, they can do no more than express their regret that they could not give a more decided mark of their approbation to each competitor.

C. ELDRIDGE, for the Committee.

C. ELDRIDGE, for the Committee.

SHOP MANUFACTURES.

The Committee awarded premiums to Calvin Dean, Providence for the best Sole Leather, \$4

Nathl Westcott, Providence 2d do. 3
 John Pettis, Johnston, best Belt Leather 4
 Calvin Dean, for Belt Leather, vol. New England Farmer.

Robert Abell, of Johnston, for Wood Screws of superior workmanship. 6

George Tillinghast of North Kingstown, for Axes and Chisssels, \$1 and a New Eng. Farmer.

John Pettis, for best calf skins, N. E. Farmer. William Miller, second best 2

John Temple, Providence, for best top roller skins, one vol. New England Farmer.

William Miller, second best 2
 Arnold Wilkinson, best steel slaies, one vol. New England Farmer

H. Grindshaw, for second best 2
 Samuel Smith, a steel slaie 1

James and Samuel Wolhour, on spinning and roping Bobbins, one vol. New England Farmer.

Sam'l Greene, on cotton lines, \$2. Stanton Hazard, \$4. Wm. Greene, \$3, Stukely Whitman, \$4. and Richard Thornton, \$3, for Furniture.

The Committee say, Mr William Hamlin, of Providence, presented a Telescope, manufactured by him, of great magnifying powers, and presumed to be the most perfect and valuable Telescope ever manufactured in the United States, for which they have awarded a premium of \$20.

HOUSEHOLD MANUFACTURES.

For Lace Veils, Handkerchiefs, &c. a premium of one each was awarded to Eliza A. Rhodes, H. Clark, Loisa Rhodes, Miss Cady, (a splendid Veil) Mary H. Abern, Louisa L. Olney, Sally H. Greene, W. I. Greene, Sarah Spooner, Lowry Carpenter, Amey Greene, Eliza Holden, Hepch. Ann Fenner, P. Weeden, Ann Eliza Hopkins, Elizabeth N. Greene, J. A. Mason, Sophia Metcalf, Frances Metcalf. A premium of \$1 each to ten scholars of the Newport Lace School

To Sally Peck, for Hearth Rug, \$1, Rosanna Greene, white Flannel, \$5, Fanny Holden, woollen Hose, \$2, Joel Aldrich, Hearth Rug, \$1, Patience Jenckes, woollen Coverlet, \$2, Mary Arnold, linen Diaper, \$2, Isabella Waterman, Carpeting, \$6, Richard W. Greene, pair Blankets, \$2, piece 3-4 mixed cloth, Edward Anthony, \$5, card cases, Mrs. Seamans, \$1, Table Linen, William Lippitt, \$1, Flannel, Wm. Gardner, \$5, stair Carpeting, the same, \$2, Naomi P. Holden, Yarn, \$1, Eliza Bishop, Frogs and silk Buttons, \$3, Mrs C. Andrews, silk Indispensible and shell Racks, \$2, woollen Hose, Polly Stafford, \$2, cord Indispensible, Sarah Aldrich, \$1, Hearth Rug, made by a lady 70 years of age, \$4 Card Racks and Boxes, Miss Metcalf, \$2, straw Bonnet, Mary White, \$5, do. do. Jemina White, \$5, Carpeting, Julia Whipple, \$4.—*R. I. American.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, OCT. 12, 1827.

The editor of the New England Farmer has been unable this week, from indisposition, to attend either of the Shows at Concord or Worcester. We cannot therefore give a particular account of these festivals till next week.

VINE DRESSER'S GUIDE.

We have this week received from the author in New York, 50 copies of the *American Vine Dresser's Guide*, by *Alphonse Lambert*, for sale at the office of the New England Farmer, price 50 cents. The author has given, in a small compass, a good deal of information on the choice of soil, treatment and diseases of Vines; on preserving grapes, on wine vessels, managing of wines, brandy, vintaging, making raisins, confection of grapes, &c. He

Miscellaneous.

CONFESSIONS OF AN ALBUM WRITER.

I have written from first to last, in two hundred and forty-six albums. In two hundred and ninety-five of them, I have made love outright to the charming proprietors, though two thirds of them excited no feelings in my naturally cold and passionless breast. I have invoked blessings on the heads of thirty-three, in the most fervent and affectionate style, some of whom I have not known an hour previous to my making the invocation; and I have complimented eighteen on their possession of unrivalled worth, and exalted genius, although to confess the truth, I knew as little about the matter as the man in the moon. Fifty times I have sworn that there is nothing in the world equal to a light blue eye, and fifty times I have sworn that nought in nature can compare with a dark black eye. I have praised bright eyes for the sunny radiance of joy that flooded every thing on which they fell—and I have praised dim eyes for the moonlight and melancholy lustre that shone in their humid glances. I have vowed sometimes that the cheek from whose rich bloom the rose might derive a fresh charm, was a thing that I devoutly worshipped—and at other times, I have sneered at the vermilion cheek, and idolized the snowy paleness of sensibility, whose tears had often so often sired for the troubles of life, that they had actually washed all the red color from the face. I have praised high foreheads for their calmness, and low foreheads for their passion—I have praised raven hair, auburn hair, chestnut hair and red hair, and to my ineffable horror, I once discovered that I had been eulogizing the ambrosial curls of a lady who wore a wig. I have lauded Grecian noses, Roman noses and pug noses, white noses and red noses, dimpled chins, double chins, and piked chins—straight eyebrows, and arched eyebrows. The consequence of all this has been that I have lost my character for consistency, not only in the estimation of others, but also in my own.—I have had the reputation of being in love one hundred and ninety-five times, though I conscientiously affirm, that I have not in reality been in love with more than sixty-seven different persons, and never with more than half a dozen at once. All my flirts of fancy have been construed into serious declarations of passion—I have narrowly escaped ten suits of breach of promise, in which the only witness against me would have been Albums, and an unpoetical jury would have infallibly convicted me. I have been called a purged swain, a breaker of vows, a hypocritical pretender, an unfeeling wretch, and (horseso refers!) a male flirt!

Dean Swift and the Farmer's Wife.—The celebrated Dean Swift had been so highly pleased with the conversation and deportment of a farmer's wife, near Dublin, that he invited himself to dine at her house, and sent her notice of the time. The trial was rather too hard for her prudence. Elated with the idea of entertaining a guest whose company was courted by the first nobility of the realm, she dressed herself as fine as her fingers could make her—in this rich attire received the Dean with stately ceremony. He in his turn made his profound obeisance, and then instantly inquired for the farmer's wife.—"I am she! pray, Sir, don't you know me?" "You! no Madam, I won't be tricked, the farmer's wife that I am come to see is a plain woman, but you look like a Dutchess."

Her excellent sense made her understand the hint, and her excellent humour made her take it in good part. She withdrew, changed her dress, and returned in a plain robe.—"Ah! 'tis she," joyfully exclaimed the Dean, "this is the very woman I am come to see, and I expect to be very happy in her company."

Oddity no proof of wisdom.—Some people affect to differ from mankind in general merely for the purpose of obtaining notoriety, and with the hope of being talked about. But those who seek distinction in this way, deserve nothing better than the obloquy from which they are attempting to emerge; and men of sense always conform to custom when they can do so without material inconvenience, or the sacrifice of any important principle.

The Pride of Wealth.—Of all kinds of pride that of mere wealth is most ridiculous and offensive. It commonly seizes on an unimproved mind, at an advanced period of life, and is marked by severity to superiors, rudeness to inferiors, ostentation and self-indulgence—extravagance in some things, and parsimony in others. These propensities, however, may be checked by goodness of disposition, and a mind capable of expanding and adapting itself to different circumstances and situations.

Five Arts.—It has been observed, we think, by Dr. Priestly, that "great excellence in any of the elegant arts is an unfavourable circumstance to youth, and except they be intended to exercise those arts as a profession, a mediocrity is much more desirable. A first rate musician can never be any thing else, and an incomparable dancer is generally a frivolous and superficial character."

Language to Children.—Some parents, even those who are wealthy and aspiring to style, instead of endeavoring to inculcate in the infant minds of their children a correct mode of speaking, make use of an incoherent gabble, which a conjurer can scarcely interpret. The consequence is, their children being disposed to learn the first words they hear, acquire a silly and disgraceful dialect, which very often affects their speech, more or less, during life. It were well if parents would recollect the importance of speaking to children, and endeavouring to make them speak in the language of correctness. This cannot be effected if they use, or suffer nurses or others to use that sort of baby talk which so often misleads and abuses the faculties of infants.

Extravagance.—Those who waste their income by splendor in dress and equipage may be said to resemble a city on fire, which skines by that which destroys it.

Theft Outwitted.—A citizen missed two pounds of fresh butter, which was to be preserved for himself. The maid, however, had not only stole it, but fastened the theft upon a cat; averring, moreover, that she caught her in the act of finishing the last morsel. The wily cit immediately put the kitten into the scales, and found it to weigh but a pound and a half! This city mode of accurate reasoning being quite conclusive, the girl confessed her crime.

A person who meant to see the descent of the Michigan, and lodged on the Canada side of the river, observed that if the British Government

would train their *fleets* for purposes of defence, no hostile foot would ever rest in that Province!

A rich farmer's son who had been bred at the University, coming home to visit his father and mother, they being one night at supper on a couple of fowls, he told them that by Logic and Arithmetic, he could prove those fowls to be three. Well, let us hear, said the old man. Why this, said the scholar, is one, and this, continued he, is two, two and one you know make three. Since you have made it out so well, answered the old man, your mother shall have the first fowl, I will have the second, and the third you may keep to yourself for your great learning.

Fruit Trees—New Arrangement.

The Hartford Linnaean Botanic Association, invite the attention of the public to the subjoined list of Peach and Apricot trees, of which they have a specimen of each variety. This Society was incorporated by the Legislature of Connecticut, in 1825, with a capital of \$25,000; its primary object is the improvement of the Horticulture and Fructification of our country, by exciting the attention of those pleasing and interesting objects, and by cultivating and introducing the most approved kinds of fruit, of every description, adapted to the climate of the eastern and middle States, and also seeds of the most valuable culinary plants. The Society have obtained about twenty acres of ground in the vicinity of Hartford, for a Garden and Nursery, and commenced their operations with success, affording a pleasing interest to those observing and interesting objects, and the circumstance which perhaps more than all others, has encouraged and retarded the more general attention to an introduction of choice fruit, (perhaps the only luxury in life not attended with some injurious consequences) is the mortifying disappointments which have been experienced in fruit trees, growing to be entirely different and inferior kinds from those for which they were sold. To remedy this evil, and to encourage the cultivation of choice fruit, they have adopted a new system, which is, to take and exhibit samples of all the varieties of fruit they cultivate, and to warrant the trees to be in conformity to the samples. They now offer to the public as the first fruits of this infant Society, from 15 to 20,000 Peach trees, including some Apricots, which for variety and richness of the fruit, and for firmness of growth, they venture to say have never been surpassed in the United States.

There are more than twenty varieties of Peach; several of which are new, and nearly all of which, they have samples of, that may be examined at J. B. Russell's Office, No. 52, North-Market-street, who is Agent of the Society for Boston and its vicinity.

Great Sale of Wool.

On Tuesday the 10th of October, the day preceding the Brighton Fair, at 10 o'clock at the Hall over the "New Market" will be sold, at Public Auction, 248 bales of Saxony Wool, consisting of 1st and 2d Electoral—1st and 2d Prima Secunda—Tertia and Quarter.

100 bales Spanish Wool,
100 do. Portuguese do.
150 do. Saxony do.

Also, 50,000 lbs. High Grade and Full Blood Fleece Wool.

The above Sale presents a favourable opportunity to growers and holders for disposing of their Wool, which will be ready at any time on or before the 10th proximo.

Catalogues of the whole will be ready for delivery, and the Wool may be examined the day previous to the sale.

COOLIDGE, FURR & HEAD, Auc'rs.

Boston, Sept. 28, 1837.

Saxony Sheep.

On THURSDAY Oct. 14th, at 10 o'clock, the day succeeding the Agricultural Fair, at Brighton, (near Boston) the entire flock of Electoral Saxony Sheep, imported in the ship Mentor, Capt. Mann, from Hamburg, consisting of
101 EWES and 24 R.M.S.

These Sheep were carefully selected by experienced agents for account of a highly respectable House in Loppic, and will be found to exceed any flock hitherto imported in regard to size and weight of fleece, while they are not inferior in any other particular. The large proportion of Ewes, of the finest quality, were not procured without much difficulty; and, in general such measures were taken as to warrant the expectation that this flock will not suffer by the most rigid scrutiny of persons disposed to improve their stock by the introduction of pure Saxony Blood.

The Sheep may be examined at Brighton, at any time before the sale.

Catalogues will be ready for delivery at our office 20 days previous when Samples of the Wool will be exhibited.

The Agent pledges himself that none of the Stock will be disposed of until the day of Auction, when they will all be sold without reserve.

COOLIDGE, FURR & HEAD.

THE FARMER is published every Friday, at \$3.00 per annum, or \$1.50 if paid in advance.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FRESSENER, Editor.

VOL. VI.

BOSTON, FRIDAY, OCTOBER 19, 1827.

No. 13.

AGRICULTURE.

We have received the following account of the state of Agriculture in Indiana, from an intelligent English farmer—from whom we should be happy to hear frequently.

AGRICULTURE IN INDIANA.

*** Probably some little information from a resident here may be acceptable. I shall therefore by leave, give you a short sketch, of which you may make what use you think proper.

I am an emigrant from England, about eight years since. On my first coming here in the year 1819 it was thinly settled, and the country very little improved; the stock of horses, cattle and sheep, in particular, very trifling, which have from that time been regularly increasing in number; the prices in consequence much reduced, say a Cow and Calf in 1820 \$20 to \$25, now from \$6 to \$8; Sheep, two to three dollars; new \$1 50. They are generally a mixed breed; but we have now the Merino and Barbary. The population also rapidly increases, but they confine themselves generally to raising Indian Corn, which when we first came here, was almost the only crop—but we now raise Wheat and Oats for sale, the Flour and the Oats for the New-Orleans market. In 1820 there was no Cotton, but what was brought from Alabama or Tennessee, the price 50 cents per pound; now we grow more than is wanted, and cannot obtain more than 7 to 8 cents. There are two or three Cotton Factories established, which now retail Cotton Yarn at 37 cts. We have also several Wool Carding Machines, at some of which they spin the Yarn, which is now sold at 62½ cents per pound, and which in 1820 was sold the wool at 50 cents, and the spinning at 50 cents more.

I forgot to state respecting Wheat, that the weevil has troubled us much for some years past, but not so much this year. Is there any means of preventing the injury they do?

I was pleased to observe in the N. E. Farmer, some notice respecting Potatoe Onions; I first brought them into this neighborhood, where they have answered well; this year I have had some which exceed one pound each—they should be planted in the fall of the year, whenever they begin to shoot, and all before the end of the year.—The frost does not injure them but rarely after being planted. They should be planted at least from 14 to 16 inches asunder, and the ground kept clean; they should not be hilled, but merely covered.

We find the want of Agricultural meetings which are much wanted, in new countries especially. In consequence of almost every man living on his own or United States land, labourers are very scarce, and the low price of produce prevents the improvements that otherwise would be made; and we have much difficulty in obtaining any machinery in this country which would tend to facilitate our various works. We should be glad to have some small sketch of Pope's Threshing Machine of which you speak so highly. Our great distance almost prevents the hope of ever seeing one in this country. In consequence of the expence attending a tillage

farm, I am making mine into pasture, principally with an intention of keeping a flock of sheep, of which I have now about 300.

Our Grasses are Timothy, Red Top, and Blue Grass—but not any Orchard.

This country seems very favorable for most fruits; we have an abundance of Peaches, large orchards of Apples, which as yet are rather young. Grapes, Mulberries, &c.

This country abounds in Stone Coals and Iron Ore; therefore it is very probable, this will at some future time become a great manufacturing country, as the price of provisions is very low and the raw materials of iron, cotton and wool may be obtained almost in any quantity. We have had one small Foundry put to work, and have another now erecting within about thirty miles.

Your ob't servant,

S. HORN BROOK.

FOR THE NEW ENGLAND FARMER.

PASTURING SHEEP, &c.

Rees' Cyclopaedia under the head "Close Feeding," gives the following—"It is of much consequence to the grazer to have his pastures kept in a state of close-feeding, as the animals are found to do much better under such circumstances, and at the same time to be capable of supporting a larger proportion of stock. Speaking of close-feeding, Mr. Young has given the following useful remarks. "In the preceding trials there was not, through the thirty weeks, scarcely a bent to be seen; the pasturage was constantly shorn to the ground, and in that state it was remarkable to see how constantly and even rapidly, it sprung, during the continuance of a drought that was destructive of all produce on the same farm, suffered to run to bent, for hay or other views. The comparison was the most decisive that can be imagined.

"In all plants cultivated for pasturage there is a great effort the moment the seed-stem runs, to which the whole growth of the plant is directed to form the seed; till then the growth is in the leaves: it is therefore palpable, that the way to have the greatest abundance of leaf, is by feeding so close as to prevent those stems rising at all.—And he may further observe, that, on this system of feeding, those grasses which yield a very great but coarse produce, become sweet, fine, and valuable, by thus keeping them close fed. The *avena clabior*, or tall oat-grass, is very coarse, but in a field of that grass, of thirteen acres and an half, it was never suffered to rise, and consequently was found, on examination, to appear as fine and pleasing to the eye as any of the more delicate grasses. It is with this view that he is cultivating it largely, and also the *ductylus glomerata*, or orchard grass, and both are remarkably early.

"He suggests it as "an inquiry that deserves attention, whether the superior profit of grazing sheep on comparison with oxen, does not depend very much on this point of close-feeding; for large cattle, the herbage must be kept to a good head to give a full bite; and consequently innumerable seed stems form, which tend to reduce the product greatly." There can be no doubt of the great benefit of close-feeding in all cases where the

lands are covered with a coarse grassy turf or sward."

FULLING CLOTH.

The faculty of being rendered thicker by compression is peculiar to woollen substances. In vain may fabrics of silk and cotton be subjected to the same process; they would not in any length of time, be rendered thicker by it, or more compact in the smallest degree. To account for this it has been observed, that the single hairs of wool when viewed in a microscope, are discovered to be thickly set with rough and jagged protuberances adapted to catch and entangle with each other. Whence it seems probable, that during the violent agitation the cloth undergoes in the mill trough, the fibres being at every stroke of the mill hammer, strongly impelled together and driven into the closest possible contact, at length hook into each other, drawing closer and closer as the process continues, till they become thus firmly and inextricably united; each thread both of the warp and wool being so joined and compacted with those that are contiguous to it, that the whole seems formed into one substance, not being liable like other fabrics, when cut with shears to unravel and become ragged at the edges.

POISON BY IVY.

Wash the part affected with a weak solution of pearl ash, or weak lie.

POISON BY DOGWOOD.

Apply a strong solution of copperas to the part affected.

NOTHS AND BLACK ANTS.

To prevent moths from eating your clothes, place with them in the chest, either or any of the following substances, viz: cedar-shavings or chips, roots or blades of the sweet flag, tobacco leaves, sheets of paper moistened with spirits of turpentine, or bits of camphor. To prevent the little red and black ants from getting into honey and sweet meat pots, it is said that sprinkling the shelves where they are placed with black ground pepper will prove effectual.

HENS.

A gill of oats a day, given to hens will cause them to lay eggs very plentifully. See N. E. Farmer, vol. III. p. 50. They also require lime in some of its compounds. Old lime mortar, or plastering of rooms, coarsely pounded, are suitable substances, which should be placed where the hens can have access to swallow what they choose.

MURRAIN IN HOGS.

It is stated by Young that a handful of nettle is to be previously boiled in a gallon of small beer, when half a pound of flour of sulphur, a quarter of a pound of elecampane, three ounces of liquorice, and a quarter of a pound of aniseeds are to be added in a pulverised state. This preparation should be administered in milk, and the quantity here stated is said to be sufficient for six doses.

MURRAIN IN CATTLE.

A letter to Dr. Mease, Vice President of the Philadelphia Agricultural Society, from Benjamin Harrison of Berkeley, Charles-City County, Vir-

ginia, in reply to a letter addressed to him, respecting a cure for the Bloody Murrain in cattle states, in substance, that a drench of the infusion of cedar berries was effectual. A quart of the infusion, containing about half a pint of the berries was given at a time; and in nearly every case the good effects were almost instantaneous; a considerable discharge from the bladder and bowels followed, and in five or ten minutes' time the animal began to eat. In nineteen cases out of twenty, a perfect cure was effected. In many cases the drench was repeated four or five times. So rapid was the progress of the disease, that cattle were found dead in the fields without the owners being under any apprehension that they were sick. As a preventive, a mixture of clay and salt, (the latter in the common proportion for stock,) tar and powdered brimstone were used. For fifty head, one gallon of tar, and half a pound of brimstone, per week were employed. These ingredients were put in a trough to which the cattle had free access. The disease it appears is endemic in Virginia, particularly in the districts bordering on tide water, and is highly contagious. See N. E. Farmer, vol. III. p. 231.

ESSEX CATTLE SHOW.

Notwithstanding the unfavourable weather on Wednesday, the company at the Cattle Show in Newbury, was larger than usual. Those who attended speak in high praise of some of the animals which were exhibited, particularly a fine bull, belonging to Mr. Kelley of this town, and which gained the first premium of 15 dollars. The ploughing match was not so satisfactory. Several articles of home manufacture were exhibited, and highly praised. Some mustard from the factory of Mr. Webber, of Beverly, was highly recommended.—*Salem Obs.*

We have received the following report by Mr. Pickering, and shall soon publish the others.

To the Editor of the New England Farmer—

DEAR SIR—The enclosed Report on the raising of potatoes from the seed, contains some facts important to be known by our farmers, before it is too late to collect the seeds from their potatoes the present year. I therefore hope you will find it convenient to publish it in your paper, in season for this purpose.

Respectfully your obt^d serv^t.

Danvers, Oct. 15. J. W. PROCTOR,
Society Lane, Ag. Socy.

PREMIUMS FOR POTATOES.

It being well known that the seeds formed in the apple, or green balls growing on the vines or stems of potatoes, sown in the manner of other small seeds, would produce potatoes of various qualities; of which, although many would be worthless, some would be of excellent texture and flavor, and abundant in quantity:—the Essex Agricultural Society proposed premiums to encourage the making of experiments, in the hope of obtaining some valuable new sorts, superior to those generally cultivated, and more to be relied on, as originating in our own soil and climate, for permanently retaining their good qualities. The expectations of the Trustees were not disappointed. Believing, however, that further improvements were practicable, they renewed the premiums; and in the present year, have been amply gratified by the result.

At the present annual exhibition of the farming products, Mr. Daniel Putnam of Danvers, and Mr. Daniel Barnham of Newburyport, presented various samples of potatoes, grown in the present year from small potatoes which were produced from the seeds taken as above mentioned, from the green balls, in the autumn of 1825, and sown in the spring of 1826.

To prevent any mixture of the different sorts, it was necessary that the product from each single seed should be kept by itself; and that this product of each sort, planted in the spring of the succeeding year, should also be kept separate from every other sort. These precautions were duly observed by Mr. Putnam and Mr. Barnham, and each of them now exhibited satisfactory proof of their success. They selected the best of the various sorts they had cultivated. The superior sort of Mr. Putnam's was red, and in shape and appearance exactly resembled the long red or River Plata potatoe; but was incomparably better, being very mealy and finely flavored. One single seedling plant of 1826, produced only four small potatoes; but these four planted the last May, each one in a hill, in good ground, yielded half a bushel, or a half peck to each hill.

Of Mr. Barnham's best sort (they were white) two potatoes grown from one seed in 1826, and planted about the middle of last May, yielded ten pounds of potatoes, some of them very large, and all of excellent quality, being very mealy and finely flavoured.

The merits of these two sorts of potatoes, "taking them for all in all," appeared so equal that, to do equal justice to the two claimants, the committee decided to blend the different premiums, and divide the same equally between them.

The committee have reason to think that as the potatoes of the second year's growth from the seed, appeared to be superior in texture and flavor to the small seedling potatoes of the first year, so the product of the third year may be superior to that of the second.

The seeds are thus saved. In autumn, or whenever the potatoes are ripe, some of the green balls are collected; and the pulp being soft, they are mashed by hand, and by washing them in several waters, the seeds are separated and made clean. These being well dried, are saved till seed time in the ensuing spring, and then sown in drills, in the manner in which garden seeds are sown. The most vigorous plants when four or five inches high, may be transplanted to another bed, at the distance of a foot from each other. Or the smaller plants growing between the best, may be pulled up; leaving the best about a foot apart, in order that the product of each plant may be kept by itself. It will doubtless be expedient to sow seeds from the best sorts of potatoes the experimenters can obtain.

By the Committee,

T. PICKERING, *Chairman.*

October 10th, 1827.

PEAR TREES.

MR. EDITOR—In regard to the disease (if so it may be called,) of the pear trees, I have never seen any thing published which has reached the full extent of my own views on the subject. The remarks of the Hon. Mr. Lowell, so far as they extend, are entitled to the particular notice of all who cultivate the pear tree. The question which I wish to introduce is, whether the destruction of

the pear tree, by the *Scolytus Pyri*, or any other insect, is from the extent of the wound given by the insect, or by a deadly poison infused into the sap of the tree. I think the question of sufficient importance to the public to entitle it to an answer, so far as is practicable. I presume many persons have concluded that it is impossible that so small a wound given by an insect should prove fatal to a tree—and are not so likely on that account to avail themselves of the only measure to save a diseased one. It is generally known that the sting of the honey bee, given to the animal body, has caused the death of a robust man in a few hours. In such cases we ascribe the death to the effect of the poison, not of the wound.

May we not as safely conclude that the vegetable kingdom is as susceptible of receiving a deadly poison into the sap of the tree or plant which may cause the destruction of the same, as that a variety of creatures in the animal kingdom should be capable of receiving poison into the blood, from so small an insect as the bee or spider, which causes immediate death. Although the effect on the tree is not so immediate, yet it may be as certain if not arrested.

I had a vigorous young tree, (of the Amory pear) which had produced fruit, and was of great promise: it was divided into two branches about three feet from the ground. In the month of August I perceived one of the branches was diseased, and appeared to be failing; and in twenty-four hours afterwards, a considerable part of the leaves were dead. I thought it best not to head it down until the next spring; but I found that the disease had extended still farther down, although the wood remained bright and lively some way above the fork. In the month of May I headed the sickly branch down close to the other, and the wood appeared sound and in good order. I dressed the wound with the composition recommended by Forsyth, and expected a new head would come out for that branch; but it ended in the entire destruction of the tree. That case, together with what I have since seen and read, has convinced me, that if there is time given for poison to be infused into the system, the tree is eventually lost.

I am, sir, respectfully yours,

J. CRANSTON.

Marlborough, Oct. 16, 1827.

CATTLE SHOW AT WORCESTER.

Notwithstanding the exceedingly uncomfortable weather of Wednesday, the Show of animals was in numbers nearly equal, and in excellence superior to that of any former year; and the concourse of people, though not so large as on some former occasions, was such as to indicate the very great interest excited by this annual Exhibition and Festival. Although the rain fell in torrents, yet there was the usual gathering round the pens, where the very fine animals which reached the ground in spite of the storm, were exhibited: and, punctual to the hour, the competitors at the Ploughing Match, fourteen in number, were on the field, ready to engage in the friendly and animating contest for the prize of excellence.

At eleven o'clock, the Address was delivered at the South Meeting House, by Pliny Merrick, Esq. who urged, with much earnestness and force, the advantage and importance of calling in to the aid of practical agriculture, all the discoveries of science; deprecating the prevalence of the notion, sometimes avowed, and oftener, perhaps, acted on,

that the farmer cannot be profited by all the aids which science or learning can afford.

The Address being concluded, the customary trial of *Forking Oxen* commenced, and continued during a very heavy rain, the numerous spectators losing, in the interest felt in this part of the Exhibition, all thought of the inclemency of the weather. At two o'clock the Society dined together at the Town-Hall.

We were agreeably disappointed at finding, after dinner, that our Sirewsbury friends had not been deterred, by the weather, from bringing on the fine team of working oxen, which they had promised to exhibit. It consisted of sixty-five yokes, all of them handsome cattle. Other teams from a greater distance would probably have been exhibited, had not the weather on Tuesday as well as Wednesday prevented.

We had not opportunity to make a minute examination of the *Articles of Manufacture*. We noticed, however, ten or twelve pieces of Carpeting, made in families, all of which were good, and some of them of extraordinary excellence. The exhibition of woollen goods, generally, and of *Broad-cloths* especially, was far superior to that of former years.

Of the quality of the Butter and Cheese exhibited, we had, of course, no other than ocular evidence.—These articles made a goodly *show* of fair and fat things, and we doubt not would well stand the *proof* of their excellence.

On the whole, notwithstanding the disappointment occasioned to many by the weather, and the inconvenience experienced from that cause, there is reason not to regret it over-much. We have proof, now, that the interest felt in this annual exhibition and competition by our farmers, is not merely that excited by the amusements of a fair weather holiday; that it is an interest which comes home to the business and bosoms of men of all occupations, but more especially of the cultivators of the soil. No object of ordinary interest would have tempted men to be abroad, exposed for hours, on such a day as Wednesday.

The duties of the day were all performed, and at the hours assigned for them so that, at half past four, the various Committees were ready with their Reports, which were made at the South Meeting House. The first was on the *Ploughing Match*, the Committee being composed of Emory Washburn, (Chairman) Adolphus Spring, Ebenezer Estabrook, Luther Spring and Silas Allen, jr. The length of this, and of most of the Reports, prevents our giving them entire this week. *Yeom.*

BEARS.

We intended ere this to have devoted a short paragraph to our shaggy neighbors of the forest—we may almost say of the field—for notwithstanding the uncivil treatment they frequently meet with, they venture forth into the orchards and corn-fields of the farmer, and cross the traveller's path whenever they list.

On Sunday last, an old she bear and three cubs were seen, about a mile from here, on one tree, picking chestnuts, by a boy who was out on the same errand. The bears would stand on the large branches, bend in, or break the small ones with their paws, and pick the chestnuts from the burs with their teeth. As soon as they saw the boy, Mrs Bruin alighted from the tree, and took French leave; while the young Bruins, nothing abashed, continued picking nuts. The boy having neither

arms, nor ammunition, came home to obtain both, as well as some assistance in killing the bears. But before his return they had made their escape—how ever, the old bear and two of the cubs were killed on Monday morning. On the same day another full grown bear was killed, which, with one that was killed on Sunday afternoon, not far from hence, and the three already mentioned, makes five on Sunday and Monday.

A gentleman was out with his dog a few days since, when hearing a hostile bark, he came up and saw a lusty bear endeavoring to climb a tree, and Pompey attacking him in the rear and pulling him down, Bruin would then turn upon the dog to punish his presumption; but Pompey being more agile, and having no inclination for a bearish hug, would spring from the enemy's reach and make good his retreat. Thus stood matters between the four-legged combatants; when Pompey being reinforced by powder and ball, an end was put to the battle and Bruin together.

The bears of Hoosac have become uncommonly numerous. We have heard of something like a dozen, killed in this neighborhood within a month. Every day or two we have accounts of bears being seen by some person or other; and though we make all proper allowances for the magnifying fears of the spectator, it must doubtless be conceded, that no bears, in the old and respectable state of Massachusetts, can bear away the palm from the bears of this neighborhood, for downright fearless and familiar intercourse with their civilized neighbors.—And yet, to do them justice, these bears are as civil and well behaved set of bears as we ever met with—exceedingly moderate in their wishes, asking, generally, for nothing but plenty of corn, nuts and sweet apples, and taking them without leave rather than trouble the owner with any kind of importunities.—*Berkshire American.*

FATTENING PIGS ON COAL.

Cunningham, in his "Two years in New South Wales," relates—"I had often heard it said among sailors that pigs would fatten on coals, and although I had observed them very fond of munching up the coals and cinders that came in their way, still I conceived they might relish them more as a condiment or medicine than as food, till I was assured by a worthy friend of mine, long in command of a ship, that he once knew of a pig being lost for several weeks in a vessel he commanded, and it was at last found to have tumbled into the coal-hole, and there lived all that period without a single morsel of any thing to feed upon but coals: on being dragged out, it was found as plump and fat as if it had been feasting on the most nutritious food. Another friend told me of a similar case, which came under his observation; and although these may be solitary instances, yet they serve at least to show the wonderful facility which the stomachs of certain animals possess of adapting their digestive powers to such an extraordinary species of food, and extracting wholesome nourishment therefrom. When we consider coal, however, to be a vegetable production, containing the constituent principles of fat, carbon, hydrogen and oxygen, our surprise will decrease."

TORTOISE SHELL.

The following singularly barbarous process for obtaining the tortoise-shell, is abstracted from an Indian Newspaper, called the *Singapore Chronicle*:—This highly-prized aquatic production, when

caught by the eastern islanders, is suspended over a fire, kindled immediately after its capture, until such time as the effect of the heat loosens the shell to such a degree that it can be removed with the greatest ease. The animal, now stripped and defenceless, is set at liberty, to re-enter its native element. If caught in the ensuing season, or at any subsequent period, it is asserted that the unhappy animal is subjected to a second ordeal of fire, rewarding its capturers this time, however, with a very thin shell. This, if true, shows more truculence and skill than tenderness in the method thus adopted by the islanders; it is a questionless proof, too, of tenacity of life in the animal, and must further have accounted a very singular fact in natural history.

The following receipt to cure a cold is said to be so efficacious, that we republish it at the request of a correspondent who has tested its virtues.—*Am. Farmer.*

Take a large tea spoon full of flaxseed, with two penny worth of tatic liquorice, and a quarter of a pound of sun raisins. Put it into two quarts of soft water, and let it simmer over a slow fire, till it is reduced to one; then add to it a quarter of a pound of brown sugar candy, pounded, a table spoon full of white wine vinegar, or lemon juice. Note.—The vinegar is best to be added only to that quantity you are going immediately to take, for if it be put into the whole, it is liable in a little time to grow flat. Drink half a pint at going to bed, and take a little when the cough is troublesome. This receipt generally cures the worst of colds in two or three days, and if taken in time may be said to be almost an infallible remedy. It is a sovereign balsamic cordial for the lungs, without the opening qualities, which engender fresh colds on going out. It has been known to cure colds, that have almost been settled into consumptions, in less than three weeks.

Virtues of Olive Oil.—An extraordinary effect of Olive Oil is reported by Mr Baldwin, the British Consul at Smyrna, who observed that, among the numerous tribe of oil porters, none were infected with the Plague. Led by this hint, he proposed unction of the body with oil to keep off the Plague, and the following was the result of the first trial. In 1792, twenty-two Venetian sailors lived five days with three infested persons, all of whom died; but the twenty-two sailors who had been repeatedly anointed with oil, remained free from the infection. Three Armenian families, consisting of twenty-seven persons, occupying the same floor, closely attended the sick of the Plague, but being daily rubbed with oil, were preserved from the infection. The nurses in the hospitals of Smyrna, who attended the sick night and day, have, by the same methods, been happily preserved from contagion. After this, the oil was employed in the first stages of the plague at Smyrna, and with the happiest effect. The body was rubbed all over with tepid Olive Oil. A pint was esteemed sufficient to effect a cure. The Caffres, who constantly smear the body with lard or oil, remain free from the Yellow Fever; and the Esquimaux tribes, who also regale on Seal Oil, remain also free; and when the Plague raged in London, tallow melters and butchers were found exempt. Instead of clogging up the pores, as might be suspected by some, the pores become open, and the oil produces a salutary perspiration.

CIDER.

"*Quit M'vices*," &c.

How does it happen, that with manifold advantages (and Pomona never showered them more plentifully than on our hills) for making good cider, so little of it is ever to be found in the cellars of New England? This question has been asked before—and the answer is obvious—want of care and skill. But very much is owing to the former: too many among us had rather swell ten or forty barrels of bad cider, than be at the trouble of producing a single barrel of good.

1st. The apples are often in a bad condition.—2d. There is a want of cleanliness in making the cider. And 3d. There is little or no pains taken, after it is made, to refine and preserve it.

To remedy these defects, it is requisite that the apples should be perfectly sound, but mellow; that great care should be taken in having every thing belonging to the cider mill clean, with a cleanly disposition in those about it; and lastly the cider, well strained, should be put into clean casks and conveyed to the cellar. As soon as the fermentation is so far completed, that the foam ceases to rise, and while the cider yettings to the ear, it should be *nicked*, (to use a technical phrase)

i. e. stopped close in the cask before the fermentation is entirely over. The object of nicking is to prevent the escape of the fixed air, which gives the sparkling appearance and lively taste that always belong to good cider. It is likewise important to prevent an intercourse with the atmospheric air, which, however cheering to the spirits of man, is apt to sour the disposition of cider. This is a point that deserves great attention. Cider, when properly managed, is in the condition of wine—in fact it is a sort of moderate wine—and the object is to prevent its becoming vinegar.—Too great care, therefore, cannot be taken to keep the fixed air in, and the atmospheric air out.

It is common for those who wish to have fine cider, to *rack it off*; as the phrase is—i. e. draw it out of the original casks and put it into others, as soon as it has become clear, after the fermentation. The object is to remove it from the lees. But the advantage of this measure is perhaps questionable; for in drawing off the cider, a good deal of the carbonic acid (fixed air) must necessarily escape, and thus far the liquor is injured. The point then is, whether the cider will be injured more by standing on the lees, than by the loss of carbonic acid in changing casks—and this perhaps can only be settled by experiment. But if it be racked off, it should be done as expeditiously as possible, that but little time may be allowed for the escape of fixed air.

Cider may be kept good in a vessel of any size, as long as it remains unbroached. But as soon as you begin to draw the cider, the outer air is getting in, and the fixed air is getting out—and this mischief is increasing every time you draw, until at length the liquor, before it is half used, becomes flat, stale, and utterly unfit to drink. To remedy this evil entirely, the cider should be kept in vessels so small that the contents of one of them may be used at the time of broaching. Hence it is, that bottled cider is superior to that of the cask. But as bottles are considered too expensive for general use, small casks might be substituted, and would be found much better than large ones, because the cider would be sooner drawn out, and therefore

not so long exposed to the air after broaching. We would therefore recommend (particularly to small families) the use of 10 or 15 gallon casks, in preference to barrels or hogheads.

Many people have an idea that cider may be improved by mixing with some foreign substance—such as rum, brandy, &c. Hence they will take much pains, and pay an extra price to get a "rum cask" to put their cider in. But this notion is erroneous. Cider instead of being improved is decidedly injured by a mixture with rum, brandy, or other spirituous liquors. Notwithstanding all the praise bestowed upon it, we have never drunk a glass of good cider from a cask previously imbued with rum. It has a rummy taste, which destroys the fine flavour of genuine cider. The object should be to get pure cider—not cider and rum.

Some persons put beets into their cider, others a slice or two of raw beef, under the idea that the liquor wants something to feed upon. What nonsense! It is not a tincture of beets, or of beef, that we wish for; but pure, unadulterated cider. And all foreign substances, whether solid, liquid, or æriiform, should be carefully excluded—and then you may put the cup to your lips, with the certainty of gratifying your palate, exhilarating your spirits and promoting your health.—*Berks. Am.*

GRAPES.

No growth of the vine which has fallen under our observation, is equal to that which may be seen at St. Mary's College in this city—an accurate description of the extent of the vine, and the quantity of fruit, not less than one thousand large bunches, from a single root, planted seven years since, would hardly be credited. We only wish that every farmer in the state could see it, as the first reflection that struck us, was the extreme, the culpable improvidence and laziness which prevents 999 out of a thousand freeholders from having on their tables a single bunch of grapes, even for the wholesome gratification of their families and friends. Here it is demonstrated that a single vine will yield much more of this delicious fruit than the largest family could consume for several successive weeks. We recommend those who would see what can be done in this country with the grape, to go and seek from the polite and venerable proprietor, the gratification which we experienced this morning in viewing his vines, his French chestnuts, his figs, &c. &c.—*Am. Farmer.*

AGRICULTURE OF THE ISLAND OF CORSICA.

In a work on this subject by M. Vigaroux, it is stated that there are wastes of great extent, called *makis*, on which the following plants grow to a monstrous size: *Cistus monspeliensis*, *Erica multiflora*, vulgaris, and other species, *Pistacia lentiscus*, *Arbutus*, unedo, *Lavandula stœchas*, and spicata, *Lenicera grata*, and other species, *Genista Anglica*, *Myrtus Commutis*, *Asphodelus*, *Helleborus*, *Ferula*, *Digitalis*, &c. These fine plants form such an impervious mass of vegetation, that the first step towards culture is to set fire to them. There are many forests in which the principal tree is the *Pinus larico*, in many instances 100 ft. high, and 4 feet diameter at the base. Of this valuable species of pine there are now plants to be had in several of the London nurseries, and it is perhaps as well, or better worth culture, as that too frequently despised tree the *Pinus sylvestris*. In general appearance it has a strong resemblance

to that species; but it exceeds it in rapidity of growth in a most extraordinary degree. We have been told upon undoubted authority, that a young individual of each species was planted in 1817 upon a sandy hill in one of the coldest of our eastern counties. About a twelvemonth since it was found that while the Scotch pine had reached no higher than six or seven feet, the *P. larico* was at least 12 feet high.—*Lon. Mag.*

SEEDS.

In the proceedings of the Horticultural Society of London there is an account of two air tight hogheads of bright looking seeds whose vegetative principle had been destroyed by the heat of the stagnant air in the hole of a vessel. Seeds from the same seedman kept in the trunks of passengers in the same vessel, vegetated remarkably well.

MIDDLE FLORIDA.

We have read with much interest a paper on the subject of Middle Florida, written by David B. Macomb, Esq. Member of the Florida Institute of Agriculture, in answer to some inquiries, proposed by General Lafayette, in relation to the expediency of a Swiss family's removing there, for cultivating the vine and olive. Mr Macomb advises, and recommends the establishment of Swiss agriculturalists in Middle Florida. He says, white labourers can, and do endure, without experiencing any inconvenience, the heat of the sun. The two grand and important staples of the territory of Florida are sea island or long staple cotton and sugar cane. The soil and climate are likewise very favorable to the cultivation of indigo and rice, wheat, maize, barley, rye, oats, millet, &c.

He thinks, there is no part of the continent of North America, more favorable to the cultivation of the vine which grows wild there, in a great variety of species. All the different foreign grapes, which have been transplanted there, have succeeded very well.

The mean heat in Florida, is less than in Southern Switzerland. The climate of Tallahassee, the capital of Florida, resembles that of Naples, without its siroc wind. The wet season continues from the middle of July to the Autumnal equinox. The orange tree grows wild in several of the counties, and in some of them, the China orange is cultivated with great success. The olive is also a staple production of the territory. Many of the trees are larger than the largest which grow in France, and excel the latter, both in the quality and quantity of fruit. Silk has likewise been prepared with success. The white and purple mulberry thrive very well.—*Salem Observer.*

METHOD OF REVIVING PLANTS.

This is called a proper method of reviving plants &c. when their leaves and buds are faded, and their bark and roots hard, and nearly dry, by M. de Droste, of Hulthof. The directions are, to dissolve camphor by saturation in alcohol, adding the former until it remains solid at the bottom: a sufficient quantity of rain or river water is then to have the alcoholic solution added to it, in the proportion of four drops to one ounce of water. As the camphor comes in contact with the water, it will form a thin solid film, which is to be well beaten up with the water in small flocculi, but will ultimately combine with the fluid, and disappear.

Plants which had been removed from the earth,

and have suffered by a journey or otherwise, should be plunged into this camphorated water, so that they may be entirely covered; in about two, or at most three hours, the contracted leaves will expand again, the young faded and dependant shoots will erect themselves, and the dried bark will become smooth and full. That being effected, the plant is to be placed in good earth, copiously watered with rain or river water, and protected from the too powerful action of the sun, until the roots have taken hold of the ground.

When large plants, as trees, are to be revived, their roots are to be plunged into the camphorated water for three hours; the trunk, and even the head of the tree, being frequently wetted with the same water, so as to retrain them in a properly moistened state. But it is always best, if possible, to immerse the plant. Shoots, sprigs, slips and roots, are to be treated in a similar manner. If plants thus treated be not restored in four hours, their death may be considered as certain, for they cannot be recalled to life by any artificial means. They should, consequently, never be left more than four hours in the camphorated bath; because the exciting action of the camphor, when it is continued for a longer period, may injure the plants, instead of doing good to them. It is not necessary to say, that the final prosperity of the plants, thus reanimated by the camphor water, must depend upon the particular properties of the former, the state of their roots, and the pains that are taken with them. The camphor produces no other effect than to restore life to plants nearly dead; after that all proceeds according to the ordinary habits, and their ultimate state must be left to art and nature.—*Journal of Science.*

SHEEP.

A friend mentioned to us as a fact within his knowledge, that about a year since, a person in the vicinity of Philadelphia, having a few acres of ground of an inferior quality, not suited for cultivation, purchased forty sheep at \$1.50 cents each, making the cost of the whole \$60. He last spring disposed of his flock at the following rates—2 dollars each for the fleece, and two dollars for the rest, making \$160—a clear profit of one hundred dollars on so small an investment. The same gentleman remarked in relation to the subject, that in England, (and he has possessed ample means of informing himself in these particulars,) a farmer, who gives attention to sheep, calculates that the fleece will pay the rent of his land, while the flesh will be left for a profit on his labour—now if the wool grower was protected in this country, or if a demand was created for the article, by a protection on woollens, how much more profitable would the raising of sheep be in this country than in England, inasmuch as the purchasing price of land here would scarcely exceed the yearly rent of the same quality in that country.

[*U. S. Gazette.*]

ICE HOUSE.

At St. Owen, near Paris, there is an ice house of one hundred feet diameter, and capable of containing 10,000,000 pounds of ice.

ONIONS.—A patch of uncommonly large onions has been raised this season by Mr. James Canfield of this town. One of them has been left at our office, measuring 14 1-8 inches in circumference, and weighing 15 1-8 ounces.—*Newark pa.*

N. YORK HORTICULTURAL SOCIETY.

At a meeting of the society on Tuesday evening the 9th inst. Mr. Wilson presented 3 very large heads of cape brocoli, weighing 12 pounds 3 ounces. Six large blood beets by Mr. Geo. Still, weighing 30 pounds.

Mr. Still also presented 12 heads of green colored Endive, very handsomely blanched. Weight of four of them 4½ pounds. Six heath peaches by Mr. Oakley, weighing 1 lb. 14 ounces.

Some beautiful Roses, by Mr. William Phelan, consisting of rosa oederata—muscata—sanguinea—noiset tei semper-florens—All in a fine state of perfection.—*N. Y. Farmer.*

The Fair under the patronage of the Montreal Agricultural Society, held on Thursday last on the plains of St. Ann, was numerously attended, considering the muddy state of the roads; cattle offered were generally of a good quality, which assures us that the praiseworthy exertions of the Society to improve the breed of cattle in this country, have not been without success.

APPLES.—In the town of Stamford, U. C. the apple trees are loaded, (some so much so as to break down,) with fruit. The crop of apples is very abundant.—*Montreal pa.*

The fourth exhibition of American Manufactures under the auspices of the Franklin Institute of Pennsylvania, was held at Philadelphia on the 3d inst. In consequence of the inconvenience experienced by the great concourse of visitors at the last exhibition, the number of whom was about 30,000, the managers intended on this occasion to demand 12½ cents from each visitor.

The enterprising Proprietors of the Cincinnati Type Foundry, have received an order, from South America, for twenty Printing Presses.

We are glad to see such a piece of news as the above. Let a free press be put in operation, and the mists of superstition and bigotry, will soon be dissipated, and an artful priesthood will no longer be able to wield the weapons of ignorance over so many millions of the human race.—*Newburyport Herald.*

To make Oats prove doubly nutritious to horses.—Instead of grinding the oats, break them into a mill; and the same quantity will prove doubly nutritious. Another method is, to boil the corn, and give the horses the liquor in which it has been boiled; the result will be, that instead of six bushels in a crude state three bushels so prepared will be found to answer, and to keep the animals in superior vigour and condition.

Strength of bone.—Mr. Bevan finds that bones of horses, oxen, and sheep, have a cohesive strength per square inch, varying from 23,000 to 42,500 pounds. One specimen of fresh mutton bone supported a load in proportion to 40,000 lbs. per square inch, for a considerable length of time, without any visible injury to the bone.

Mr. Christie has ascertained that a magnetic needle comes to a rest more quickly when vibrated and exposed to the rays of the sun, than when vibrated in the shade, and this entirely independent of any mere effect of change of temperature. When the needle was shaded, he could easily make the fiftieth vibration; when it was exposed, he could not distinguish beyond the fortieth.

CATTLE SHOW AT CONCORD, Mass.

On Wednesday the 10th inst. the Society of Middlesex Plowmen and Manufacturers held their annual Cattle Show and Exhibition of Manufactures, in this town. Notwithstanding the inclemency of the weather, twenty teams were entered for the Ploughing Match before eight o'clock, A. M. and ten single and eight double teams, being found qualified agreeably to the rules of the Society commenced the work at nine o'clock, in presence of an unusually large collection of people. At ten o'clock, a procession of members and citizens was formed at the Middlesex Hotel, and accompanied by a band of music to the Meeting House, where select pieces of music were performed by a choir; prayers were offered by the Rev. Mr. Francis, of Watertown, and an Address by the Hon. Edward Everett. The performances at the meeting-house, were of the first order, and were listened to with great interest and attention, by an audience which filled the house to an overflowing. After the ceremonies at the meeting-house the several committees proceeded to the discharge of their respective duties. The exhibition of neat stock, swine and sheep, was uncommonly good and the number and variety was unexpectedly great, considering the inclemency of the weather more than sixty pens being filled with fine specimens, in addition to the interesting exhibition of working oxen which were not in the pens. Many of the specimens were of the first rate, and would have done honor to any state or country. With respect to working oxen, our exhibition has always held a high rank, but this year we observed a marked and evident improvement. At the time of the trial of the strength and discipline of working oxen, there was a violent shower; the road was much cut up, and the trial was had under every disadvantage, still most of the oxen performed their task with apparent ease and dexterity. A single yoke was attached to a waggon loaded with over five tons of gravel, which must have been much increased in weight by the rain which fell, and each pair drew this load up a hill of considerable ascent; and in the manner of their backing and checking the same, evinced that they had been well trained. At three o'clock, the Society partook of a dinner at the Middlesex Hotel, at which the following toasts were drunk:

1. *The President of the United States.* Like the Diamond—the gross and malicious rubs of opposition, only cause him to shine with a more brilliant lustre.
2. *The Governor of the Commonwealth.* At the people's Show he has twice had awarded to him, the first premium—may he still continue to receive it.
3. *The Farmers of Middlesex.* Let each one's farm be well cultivated, for land without cultivation is like self-righteousness, the more a man has of it, the worse he is off.
4. *The days of "auld lang syne."* When there was more temperance and less phisic, more honesty and less law, more practice and less preaching.
5. *The late Harrisburgh Convention of Wool Growers.* Success to its endeavors, but let there not be a great cry and little wool, as the devil said when he shear'd the pig.
6. *Internal Improvements.* Let there be more railing and less daming.
7. *Innovation called Improvement of Taste;* which has exchanged the milk-pail, the distaff and cook.

ing utensils, for Waverly, Cooper, and the Piano."

8. *The enlightened and devout Clergyman, the learned and peace making Lawyer, and the scientific and faithful Physician:* We rank them among our most valuable blessings.

9. *The proselyting Clergyman, the pettifoggling Lawyer, and the quack Doctor:* If they must live, may they live on each other.

10. *The political and religious partisan:* Always on the right side—so is an off-oe.

11. *John Bull;* not content with his own, is trying to break into our *Maine Pasture*, let him keep his own side of the hedge, or we'll put a ring in his nose.

12. *Old Bachelors and old Maids;* with all their gettings, may the former get *taxed* and the latter get *married*.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, OCT. 19, 1827.

BRIGHTON FAIR.

The annual Cattle Show, Fair and Ploughing Match of the Massachusetts Agricultural Society was held at Brighton on Wednesday last. All the parts of the exhibition, which have usually occupied two days, were on this occasion accomplished in one. This arrangement was found much more satisfactory to those who attended, as it afforded an opportunity of witnessing all parts of the exhibition in a much shorter space of time.

The number of young cattle, of swine and of sheep was not so large as on some former occasions. There were a number of pairs of fine working oxen, particularly from Sutton and Concord. The peas were filled with fair specimens of stock, native and imported, among which were noticed two fat oxen, owned by Ira Yeaman of Westfield, one weighing 2440 lbs. the other 2363—several remarkably fat, owned by J. Estabrook of Athol—a full blood Alderney heifer, by Gorham Parsons, Esq.—a Holderness cow owned by the same gentleman—several merino Ewes and Bucks by J. Barrett and G. M. Barrett of Concord—Merino Bucks and Ewes, by J. Webber of Bedford—a fine heifer owned by John Mears of Dorchester, 17 months old, weighing 780 lbs. sired by Mr Welles' bull—swine by Silas Dudley of Sutton—milk cows by J. W. Watson of Princeton, and James Robbins of Watertown—some fine sheep of the breed called *Devonshire Nots*, recently presented to the Massachusetts Agricultural Society by Gen. John Coffin; one of them sheared 13½ lbs. long combing wool; and often weighing 40 lbs. per quarter—8 Bremen geese by John Perry of Boston—the black mule Roll, 5 years old, and bay mule Pizarro 2 years old, bred by S. W. Pomeroy, Esq.—The Jack Selim owned by the same gentleman—a cow and 4 calves, owned by John Welles, Esq. being the stock of Celebs—The Young Admiral owned by J. Prince, Esq.—a cow, 4 years old, owned by Nathan Adams—and other fine cattle owned by Zebecde Cook, Jr. Abijah White, Stephen Patch, &c.

The Ploughing Match was finely contested and afforded a pleasing exhibition. There were thirteen ploughs entered, ten of which took the field, and performed the task with great care and skill. One plough was so contrived as to require no person to hold it, and but little attention from the driver, which we should consider a great improvement.

There were a considerable number of new inventions and improved agricultural implements offered, some of which promise to be useful. This part of the Show was indebted, on this occasion, as well as on many others, to the zeal and activity of Mr. NEWELL, the public spirited proprietor of the Agricultural Establishment in Boston, for many of its attractions. He has always forwarded specimens of his numerous implements and machines, and has been the means of introducing others from a distance.

The first claim to a premium, offered thirty years ago for the *best orchard*, was made this year by four gentlemen. Mr. LOWELL observed that no better evidence could be given of the usefulness of the Society, than the improvement made in this important branch of agriculture; and that nothing would lessen the consumption of spirituous liquors so effectually as the introduction of good cider.

The manufactures, particularly the household articles, were numerous and elegant; among which were noticed beautiful pelermes made from that simple and abundant article, *the floss of milk weed*. There were specimens of wrought muslins, laces, straw work, artificial flowers, wrought shell combs &c. Among the specimens of ingenious needle-work was noticed a patch-work bed quilt, formed of 9220 pieces, all equal sized, regular hexagons, less than an inch in diameter, of various colors and figures, tastefully arranged, wrought by a lady of this city.

The occasion was honored with the company of many gentlemen in this vicinity, the Governor of the Commonwealth, Gen. COFFIN from England, a liberal benefactor of the Society, Capt. BASIL HALL of the British Navy, who omits no opportunity of making himself acquainted with the institutions of this country. The dinner tables were decorated with flowers from the garden of JOHN PRINCE Esq. of Roxbury, and the Botanic Garden at Cambridge. The dessert was furnished with fruit from the gardens of several horticulturists in this vicinity.

At half past 1 the members of the Society went in procession from the Agricultural Hall to the Church, where, after a short and appropriate Address by the Hon. JOHN LOWELL, the President of the Society, the premiums were announced. From the early hour, at which our paper necessarily goes to press, we are unable to give them this week.—They will be published in full, with the Remarks of Mr. LOWELL, in our next paper.

Agricultural Extras—MR. SAMUEL POND of Cambridge has left at the New England Farmer office this week, two roots of Mangel Wurtzel, each weighing 12 pounds; and a crook necked squash weighing 25 lbs.

MR. HENRY A. BAEED of Lynn has likewise left a pear, weighing 1 pound and 12 ounces—thirty of them filling a half bushel.

FOR THE NEW ENGLAND FARMER.

ON LEAVES FOR MANURE.

MR. EDITOR—The changing foliage warns the farmer again to make ready for gathering his supply of leaves; the comfort of his cattle requires it, and a clean abundant litter, to make a warm nest for his hogs, will assist much to their fattening.—These advantages would pay for the trouble of getting in leaves; but when their value as a manure is well considered, it seems that no one would overlook a way so easy to benefit himself. That leaves manure the land, is not a new doc-

trine; it is as old as the world. Their yearly fall, and the occasional fall of timber, are the ancient ordinance, by which, the happy soil which we till, was prepared for cultivation; whether its primitive sweetness and virginity has been impaired by injudicious husbandry, and are to be reclaimed, or whether the owner wishes to preserve it entire, the means are the same; a steady industry to provide manure, in such proportion, as always to exceed somewhat the more requirements of the crops. Of these means, the gathering of leaves, where woodland is near, is the easiest and the most profitable; it is much attended to in the best cultivated parts of Europe. The Swiss, who have to support a thick population upon a rough and rocky soil, gather leaves wherever they are to be found; in their apple and chestnut orchards; by the road side; and in their small cities the privilege of raking up the leaves from the public walks is paid for by the farmers. In Flanders they gather great stocks of them, and their beautiful cattle and horses have the benefit of most abundant litters.

I am urged again, Mr Editor, to these remarks by the benefits which I have received from the practice; I have endeavored every season to get in more than before, and I hope soon, if the weather proves favorable, to secure a greater stock of them than ever I have yet. Well mixed with cattle dung, they are the most assured means of raising a good crop of potatoes, of superior flavor and excellence.

The gathering of leaves may be greatly accelerated by suitable arrangements: a cart with ladders fore and aft, and long slats of boards to go from ladder to ladder to secure the sides, and stakes, is the best adapted carriage. The leaves should be raked in small heaps, a sheet of tow cloth two yards square should then be laid on the ground, and the small heaps be raked into it; when full a man ties the corners of the sheet, and hands it to a boy, who keeps on the cart, and receives it; he unties the bundle and lets the contents go, and keeps treading all the while; in this way a load is soon obtained; and to the above tackling, some little brush may be added to the sides of the load to build it up, and hold on the leaves. I have tried to use baskets to load the leaves, but have found the above sheet to work easier and quicker, and in order to make it more durable, I have had a small rope sowed round the edge of it, and let out about eighteen inches at the corners, which makes it easier to tie, and secures the sheet from getting torn. Such a sheet will cost about one dollar.

In the use of leaves the hogs excel, for whether as a litter in the covered part of their sty, or whether thrown in moderate quantities in their yard, when dirty, they soon work them and secure them from the power of the wind; when used for littering cattle, it is absolutely needful to work them with their dung. When the floor is cleared in the morning, the dung, urine and leaves should be well worked and chopped together with the shovel before they are thrown out on the heap; if it is not so done, the wind will surely take hold, and disappointment and disgust ensue; when so mixed, they will soon dissolve in the ground, and seldom any trace of them be seen in fall, when potatoes are dug.

With much esteem, I am your friend and serv't,
J. M. G.

Weston, Oct. 18, 1827.

Recipe for buckwheat bread or cake.—"1 quart milk, 1 gill of yeast, 1 gill of molasses, a little salt, with buckwheat flour added, to make it a little stiffer than pan cakes. After it is sufficiently raised, to be baked in a baking kettle."

The simple, wholesome and pleasant bread, of which the above are the ingredients, though in common use in some parts of New England, may not have fallen under the notice of some readers of the Farmer. It is equal to many kinds of cake in a rich sweetness of taste, and is free from all objectionable qualities. The ease with which it can be made is also a recommendation of some value.

A SUBSCRIBER.

General John Coffin has presented to the Massachusetts Society for promoting Agriculture, 4 Rams and 3 Ewes, of a breed of fine long woolled sheep, called "Devonshire Nots," selected by himself in England, in June last, and which he brought with him to this state. The sheep cost about 7 guineas each. They will be seen in one of the pens at the Show this day.

At a meeting of the Trustees of the Massachusetts Society for promoting Agriculture, held at Brighton, Oct. 10th, 1827,

Voted—That the thanks of the Trustees of this Society be presented to General Coffin, for this renewed proof of his wish to advance the agricultural prosperity of his native state, and that he be respectfully invited to attend our Show, and to do the Trustees the honour of dining with them on this occasion. JOHN LOWELL, President.

B. GUILD, Sec'y.

It will be remembered that General Coffin some years since presented to the society a stud horse, Columbus, of the cart horse breed.

A fine Calf.—Jonathan Eastman, Esq. of Concord, N. H. has a fine bull calf, only 8 months old, of fine proportions, measuring 5 feet in girth, and weighing 62½ pounds.

Marine shells continue to be very frequently thrown up by the Mineral Springs at Eutaw, S. C.

SALE OF WOOL.

The sale of Wool over the Boston Market, by Coolidge, Poor, & Head, brought the following prices.—Foreign: 1st, 2d and 3d prima Saxony Wool brought from 35 to 85 cents the pound; assorted do. do. 89 cents.—First Electoral Saxony brought 115½; second do. do. 73 to 111. super Saxony, four bales only, sold, 42. Leonesa Wool, 30 a 57½; fine spanish, 63 a 64; Portuguese, 27 a 28. Domestic, Full Blood, 34 a 47; extra do. do. 48; extra do. do. saxony, 49; full blood saxony, 56; full blood selected fleeces, 61½; stapled wool, 29 a 40; full blood Merino, 28 a 29. There were considerable sales of inferior qualities to the above, which brought lower prices.

The population of Spain decreases annually; many towns have become heaps of ruins, and large numbers of inhabitants can find no employment whatever. In one town alone, Segovia, a place which still bears proof of the former greatness of Spain, and formerly the seat of extensive manufactures, the decrease of population in ten years has been two thousand. Of the six thousand residents in it at present, one thousand are soldiers. It is said, however, that its cloth, which was formerly not much esteemed from the fading of its colours, has lately improved in quality, though not

so good as that of England or France, and the best sorts one third dearer. Immense numbers of merino sheep use to be fed in the vicinity of Segovia; but hardly any are now to be seen.

Bulbous Roots.

Just received and for sale at the office of the New England Farmer, a fine collection of bulbous Flower Roots, from Holland, and from a botanic garden in this city, among which are—**Hyacinth and Martagon Lilies.**—These make a fine appearance in the borders of gardens. They are hardy and durable. These plants have bulbous roots and should be planted in rich soil, 4 inches deep measuring from the top of the bulb. The small roots below the bulb are perennial. The flower stalk after it leaves the bulb, throws out many small roots in every direction for the support of the plant—these roots are annual. Martagon Lilies grow from five to six and a half feet in height, and produce from fifteen to twenty-five flowers on a stalk. A tiger lily purchased at the Botanic Garden in Cambridge about two years since, produced this year, (1827) five flower stalks, on an average, six feet and four inches in height, having in the whole 210 flowers. Autumn is the proper season for planting them.

Early Top or Tree Onions.

These produce onions at the bottom and a bunch of small ones on the top of the seed stalk. The small onions are proper to plant early in the spring, and seldom fail to produce a good crop under proper cultivation. They should be planted in rows ten or twelve feet asunder, and set two or three inches apart, and one inch deep, taking care to place the bulbs downwards. They soon spring up, and from their size and vigorous growth, are not subject to be destroyed by insects. Should they put forth seed stalks, as many of the larger ones will, they should be broken off soon after they appear, otherwise the onions at the bottom will not be so large. These onions are mild, grow to a large size, and are, generally, raised with less trouble than the common kind.—Just received for sale at the Farmer Office.

JAMES BLOODGOOD & Co's.
Nursery, at Flushing, on Long-Island near New York.

IN behalf of the proprietors of the above nursery, the subscriber solicits the orders of horticulturists who may be desirous of stocking their gardens and fields with fruit trees of the finest sorts and most healthy and vigorous stocks the present autumn.

Bloodgood & Co. attend personally to the inoculating and clogging of all their fruit trees, and purchasers may rely with confidence that the trees they order will prove genuine.

The subscriber, agent of the above nursery, will receive orders for any quantity of

FRUIT AND FOREST TREES, FLOWERING SHRUBS, AND PLANTS.

And the trees will be delivered in this city at the risk and expense of the Purchaser; the bills only be paid to him.

The reputation of this nursery is so extensively known and has been so well sustained that I take leave to refer those in want of trees to any of the Horticulturists in this city and its vicinity, and if peculiar demonstration is desired, I invite those who wish to be thus satisfied to examine the trees in my garden at Dorchester, procured from this nursery for three or four years past, some of which are now in bearing, all in a healthy and vigorous state.

Catalogues will be delivered gratis on application to
ZEB COOK, Jr.
Rogers' Building—Congress-Street.

Grass Seeds, &c.

For sale at the office of the New England Farmer, No. 52 North Market Street, Boston, a large variety of **Grass Seeds**, comprising **LUCERN, FLY MEADOW, GREEN GRASS, HERD GRASS, RED TOP, RED and WHITE HOVEY, SUCKLE CLOVER &c.**—with the largest assortment of **Garden and Field Seeds**, to be found in New England.
Also, 20 bush's Irish Canary Seed; genuine **English Rape Seed**; Hemp Seed, &c. for birds.

Vine Dresser's Guide.

A few copies of the American Vine Dresser's Guide, by Alphonse Loubat, just published; for sale at the Farmer office, price 50 cents.

Cow Wanted.

A prime young Cow, having all the properties necessary to render her useful to a family in the city, is wanted, for which a fair price would be paid. Enquire of the Publisher of the New England Farmer.

In Press, by E. Littell, Philadelphia, and will speedily be published and for sale in Boston, by R. P. & C. Williams, No. 79 Washington-street.

The Apocalypse of St John, or Prophecy of the Rise, Progress, and Fall of the Church of Rome; the Inquisition; the Revolution of France; the Universal War, and the final triumph of Christianity. By the Rev. George Croly, A. M. H. R. S. L.

New England Farmer's Almanack, for 1828.

Just published, at the New England Farmer Office, and for sale by BOWLES & DEARBORN, 72 Washington Street, and at the Bookstores generally, the *New England Farmer's Almanack*, for 1828, by Thomas G. Fessenden, Editor of the New England Farmer.

This Almanack, in addition to the usual miscellaneous matter contained in similar works, contains a Calendar of the Soil, for each state in New England; the Sun's declination; and 10 pieces of agricultural matter on the following subjects:

- On Sowing New Plow in corn, &c. &c. &c. on Small Farms
- on Clearing a Field as a Manure—on Types or Pigs in Poultry—on Agricultural Arts—on Felling a Tree—on Stagger in swine—on How to cure a Rabbits, which shall not be chit-fled, by Dr. Green of Mansfield, Ms.—How to Fatten Poultry—A cheap method of preventing the disagreeable smell of Prunes—Root Sucker, with its Swarms—on Grafted Trees—on Pines
- on Charcoal—on Fire as a Manure—on Types or Pigs in Poultry—on Praying Heavily—on the value of Time—Machines for gathering Clover Heads, with two illustrative engravings—Sir Asdey Cooper's Chilli-dan Ointment—Receipts for the Ladies—containing directions for making several kinds of Cake.—Miscellaneous, &c.

This Almanack may be purchased, wholesale and retail, of O. D. Cook & Son, Hartford, Conn.—Hobbs & Fessenden Brattleborough, Vt.—Isaac Hill, Concord, N. H.—John Prentiss, Keene, N. H.—John W. Foster and Childs & Sparhawk, Portsmouth, N. H.—Pearson, Little & Robinson, Portland, Me.—Whipple & Lawrence, and John M. Lee, S. Salem—Ebeneszer Steedman, Newburyport—Hillard & Provo, Cambridge—Ezra Collier, Plymouth—E. & G. Johnson, West Brookfield—Charles Denon Harris, Worcester—A. S. Breckwith, Providence—G. Thorburn & Son, No. 67 Liberty Street, New York—and by booksellers and traders generally. Country Dealers and others supplied on the most favorable terms.

To the Hartford County AGRICULTURAL SOCIETY.

The Committee on Ploughing beg leave to report,—That they have attended to the duty assigned them. There were three competitors for premiums—the ground ploughed, one fourth of an acre each—the time allowed for ploughing it, one hour—to be ploughed not less than 7 inches in depth; it was not without some difficulty the selections were made. (It was all so very well ploughed,) but upon close examination, they have thought fit to award to

Mr. Daniel Illinsdale, the	1st Premium.
“ Benjamin J. Boardman,	2d do.
“ Cyrus Porter,	3d do.
“ Harvey Marshall,	4th do.

JOSEPH MORGAN, Chairman.

To the Hartford County Agricultural Society.

The Committee of Inspection beg leave to report.

That the number of domestic animals brought forward for inspection, has not been so great as at some former exhibitions. This fact, in the opinion of your committee, is to be attributed solely to the unfavorable state of the weather, and not to any diminution of the zeal and interest heretofore manifested by the members of the society in promoting its objects.

The animals offered for premiums on the present occasion, and especially the younger part of the neat cattle and horses, were, in the judgment of your committee, superior to those presented at any of our preceding annual Fairs. Your committee, are happy to express their unanimous opinion that, from the first organization of this Society, to the present time, a gradual and steady improvement in almost all our valuable farm stock, has been clearly discernible. If this opinion be correct, the utility of the society is fully demonstrated, and ample encouragement afforded for persevering exertion.

Probably no section of our country can produce a finer race of native cattle, than the County in which we live. Most of the foreign breeds, of known and established excellence, are now propagated within the limits of this society. It is not the business of your committee to determine the comparative merits of the different breeds—every Farmer will decide for himself, and may select such as he shall think best adapted to his particular purposes.

In awarding the premiums offered by the Society, your committee have, in a number of instances, decided with much hesitation, and have been obliged to allow a preference when there was very little superiority. Annexed is a list of names of the successful competitors. The breed of animals is designated so far as known, and the premiums awarded to each by your committee.

Per order, E. WOLCOTT, Chairman.

Hartford, Oct. 4, 1827.

The remainder of the Reports, &c. will be published soon.

The fourth Exhibition of American Manufactures under the auspices of the Franklin Institute of Pennsylvania, was held on Wednesday at Philadelphia.

The fifth exhibition of the Pennsylvania Agricultural Society, was to have been held near the “Blue Bell” on the 11th and 12th inst

State of Society in Botany Bay.—When strolling through the streets of Sydney, on first landing, very singular reflections will naturally intrude upon the mind, on perceiving the safety with which you may jostle through the crowds of individuals now suffering, or who have suffered the punishment awarded by the law for their offences, men punished often for the deepest crimes, with whom in England you would shudder to come in contact. Elbowed by some daring highwayman on your left hand, and rubbed shoulders with by even a more desperate burglar on your right; a foot pad, perhaps, stops your way in front, and a pickpocket pushes you behind—all retired from their wonted avocations, and now peacefully complying with the tasks imposed upon them, or following quietly up the even path pointed out by honest industry. But nothing will surprise you more than the quietness and order which prevail in the streets, and the security wherewith you may perambulate them at all hours of the night, indifferently watched as they are, and possessing so many convenient situations wherein robbers may conceal themselves, pounce upon you, and make their escape with their booty, without even a chance for detection.

At the Regimental Review in Quincy, on Wednesday, several ball cartridges were fired, probably by accident, and a young man attached to the Roxbury Artillery, was badly wounded in the arm.

Peach Pie.—The best fruit pie that is eaten may be made of Peaches. The crust made in the common way, should be put in a deep dish to save the juice which is very abundant. The peaches should be wiped and put in whole, with a sufficiency of sugar. The stones impart an agreeable flavor, which renders any other seasoning unnecessary.

The uses of Ridicule.—Ridicule often succeeds where argument fails; yet it is a dangerous weapon, when unskillfully wielded. For it is by no means the test of truth. It may be applied to mislead and seduce instead of reforming; and the blended colours of ridicule are sometimes more difficult to separate, than the strong lights and shades of truth and error. Besides this, it happens too frequently, that the ridicule falls where it is least deserved. This, however, is the fault of the writer, and not to be imputed to the nature of his subject.

Misplaced Wit.—Wit mistimed and misplaced is not only very foolish, but is more ridiculous than actual dullness.

Honesty the best Policy.—He who has the character of a crafty and tricking man, is entirely deprived of a principal instrument of business, and will find nothing succeed to his wish.

Praise sometimes disgraces its object.—A conspicuous character is often more deeply injured by clumsy praise than he could be by the most malignant abuse; and Phocion, when he heard the plausive shouts of an Athenian mob, was apprehensive that he had spoken or acted like a fool.

Affection of Gravity.—It is so common a remark that wise men are grave, that many have sought and some have succeeded in obtaining, by an affection of gravity a character for wisdom to which they are by no means entitled.

Definition of Behaviour.—Rochefoucault said—“Gravity of behaviour may be defined a mystery-

ous carriage of the body to conceal defects of the mind.”

Large Radish.—A radish was raised this season in the garden of Mr Moses Dow, in Atkinson, N. H. measuring two feet in length and its greatest circumference was thirteen and a half inches.

Fruit Trees—New Arrangement.

The Hartford Linnean Botanic Association, invite the attention of the public to the subjoined list of *Peach* and *Apricot* trees, of which they have a specimen of each variety. This Society was incorporated by the Legislature of Connecticut in 1825, with a capital of \$25,000; its primary object is the improvement of the Horticulture and Fruit of our country, by exciting the attention to those pleasing and interesting objects, and by cultivating and introducing the most approved kinds of fruit, of every description, adapted to the climate of the eastern and middle States, and also seeds of the most valuable culture plants. The Society have obtained about twenty acres of ground in the vicinity of Hartford, for a Garden and Nursery, and commenced its cultivation with success, affording a pleasing promise of public usefulness. They have been convinced that the circumstance which perhaps more than all others, has discouraged and retarded the more general attention to and introduction of *the Fruit*, (perhaps the only luxury in life, not attended with some necessary consequence) is the numerous disappointments which have been experienced in fruit trees proving to be entirely different and inferior kinds from those for which they were sold. To remedy this evil, and to encourage the cultivation of choice fruit, they have adopted a new system, which is, to take and exhibit samples of all the varieties of fruit they cultivate, and to warrant the trees to be in conformity to the samples as they now offer to the public, as is the mode in this infant Society, from 15 to 20,000 Peach trees, including some Apricots, which for variety and richness of the fruit, and for thriftiness of growth, they venture to say have never been surpassed in the United States.

There are more than twenty varieties of Peach; several of which are new, and mostly all of which they have samples of, that may be examined at J. B. Russell's Office, No. 52, North-Market-street, who is Agent of the Society for Boston and its vicinity.

Extensive Nurseries.
FOR SALE at the FRUIT ESTABLISHMENT in NEWTON, one mile from Agricultural Hall in Brighton the greatest quantity and variety of Fruit and Forest Trees known at any other place in New England.

Selections may be made of as large sized trees as can be desired for transplanting. Those of the fruit kind are all budded or grafted, and comprise the best sorts which have been discovered in the vicinity of Boston. Of English Cherries there are 12 sorts; of Peas 20 sorts, including 6 of the new kinds sent by Mr Knight to the Hon. John Lowell. Of Peaches, Nectarines and Apricots 25 sorts, of Apples 30 sorts, also Quince bushes; Red and White Annona Bushes, of the most superior English Grapes of several sorts, and the productive native Grape called Isabella; Currant bushes of 6 different kinds and all sizes on moderate terms.

Of Forest trees, a variety, but we only mention the following Flowering Horse Chestnut, Flowering Catalpas, Butternuts, Weeping Willows, Mountain Ash, Sugar Maple, Elms, Silver Fir, Larch, White Mulberry, Albionus, Gum Acaia, Three Thorned Acaia, Magnolia, &c. Also, Rose bushes of several varieties, and Lilacs.

The prices in general we will merely say, shall be as low, or lower than at any established Nursery known in the United States. Those who wish for any quantity of trees, particularly large ones, and especially an orchard of Peach or Apple trees that will bear in the bearing, though they may be at a considerable distance, will do well to bring or send a wagon, and make their own selections; and in this case careful refreshment will be furnished gratis, and directions given for setting and managing the trees.

Written orders addressed to JOHN or WILLIAM KEMBLEY, and directed to the Horticultural Nursery Office, will be speedily received and punctually attended to; or they may be left at the grocery and seed store of Mr JOSEPH BRIDGE, in Court street, where Catalogues may be furnished gratis.

Trees will be sent to Boston when ordered, and suitably packed in mats, for shipping or distant conveyance by land, if desired; but distant gentlemen should employ some agent to receive and pay for them.

A. B. Great care will be taken to preserve the roots.

Medical Lectures—Boston. TIME CHANGED.—Medical Lectures of Harvard College will begin the THIRD WEDNESDAY IN OCTOBER, at the Medical College, Mason street, Boston. The time having been changed from the THIRD WEDNESDAY IN NOVEMBER, when they formerly began.

WALTER CHANNING, Dean of the Medical Faculty.

Aug. 31, 1827. The FARMER is published every Friday, at \$3.00 per annum, or \$2.50 if paid in advance. Gentlemen who procure five responsible subscribers, are entitled to a sixth volume gratis.

AGRICULTURE.

ADDRESS

Of the Hon. JOHN LOWELL, President of the Massachusetts Agricultural Society, delivered at the public meeting of the Society on the 17th inst. previous to the declaration of the premiums awarded to the competitors at the Cattle Show.

The Trustees of the Massachusetts Agricultural Society this year resolved to make a very important change in their arrangements—instead of extending their show to two successive days, they determined to imitate the example of other societies in this state, by confining it to one. It may naturally be asked why such a measure, so convenient to competitors, was not adopted before. To this we reply that our situation was, in many important respects, different from that of the interior societies. Our society was a general one, offering premiums throughout the whole state. We had two classes of competitors—those in the adjacent counties of Middlesex and Norfolk, and those from the most remote parts of the state. With respect to those who came from a great distance, it was impossible for them to return home, either the night of the show, or even the next night. It was therefore of comparatively small moment to them, whether they were or were not detained one night longer. With respect to competitors in the adjoining counties, most of them could return home the first day, and were no competitors on the second. The Norfolk and Middlesex farmers, who entered into competition in the ploughing matches and working cattle, came only on the second day. But to the Trustees themselves and to the spectators, the repetition was very inconvenient, expensive and tedious. The Trustees, influenced by these considerations, have this year unanimously decided to try the experiment of confining the exhibition of cattle, the ploughing match and of working cattle to one day. This change obliged them to give up all preparatory meetings, and to make the day purely one of business. The same necessity obliges us to dispense with all formal addresses, and to limit ourselves to the simple declaration of the premiums awarded, without those explanations of the grounds upon which the decisions are founded, which have been usually given on such occasions. Indeed there is less necessity for such minuteness. In the origin of the Institution, there were little untounded jealousies to be overcome—there was not that entire confidence in the rectitude and fairness of the judges, to which experience has demonstrated they were entitled. It was improperly viewed as the exhibition of the more opulent farmers, in which a plain cultivator stood a very humble chance. All these errors and prejudices, (for they were always such) have been dissipated by time. The whole course is so fair—the Trustees have so little agency in awarding the premiums, they are so entirely under the control of experienced graziers and farmers, that we need no longer to make apologies or excuses for our decisions. The question, however, will naturally occur, and it ought, in every successive year, to be repeated, have these shows

been productive of serious and lasting benefits to the agricultural interests, or which is the same thing, to the nation? This is a question of fact, which every man will settle in his own mind according to his experience, or his prejudices. For myself, I have no doubts that the effects, remote, and immediate, of these public exhibitions, have been as great as their most sanguine friends anticipated. I cannot better introduce a few remarks on this topic, than by a very apposite quotation from a recent British work, inserted in a late number of the New England Farmer.

"The great body of cultivators in Great Britain, whose farms are of considerable extent, have generally received a suitable education, by which their minds are enlarged; animated with a desire to improve their condition in the world, and rendered equally quick to perceive, and ready to adopt, such improvements as may occasionally be proposed.—In former times, it was objected that farmers were obstinate and bigoted, averse to every kind of innovation upon established practice, and persisting in ancient systems, even after their deficiency and inutility had been ascertained in the most decisive manner. Whatever truth there might formerly be in the objection, its force is now completely removed, there being no set of men whatever more open to conviction or more willing to adopt new practices, than the British farmers of the present day. This change of disposition has been accomplished by a general circulation of agricultural knowledge, since the National Board of Agriculture was established, by numerous periodical publications on rural economy, and by that increase of wealth which flowed from the exertions of the farmer, and which naturally stimulated a search after new improvements. According to the measure of attention bestowed upon the education of farmers, it may be expected that improvement will hereafter advance. A man of uncultivated mind may hold a plough, or drive a harrow in a sufficient manner, but he will seldom introduce an improvement, or be the means of effecting any change in the established system of rural economy.—Brown's Treatise on Agriculture.

This extract from a British work is truly cheering to the friends of agricultural improvement in our country. I know my audience too thoroughly to rely upon their unqualified acceptance of the truths therein alleged without due evidence. We of New England, are a cautious and thinking people, slow in adopting new opinions. Long may we continue such. Well, then, are the facts stated by the writer true, as respects England? They are within my own personal knowledge, derived from authentic documents, and ocular evidence, strictly true, and in no degree exaggerated. British agriculture in 1780, when the Royal Institution for its promotion, was founded by Parliament with an ample donation of \$22,000 a year, was in a better state than ours is at the present time. Yet the progress has been so great in Great Britain since the establishment of the National Board of Agriculture, and of the Bath and West of England Society, for the promotion of the same objects, that it has been fully proved by official documents, that the produce of British farming indus-

try, with a worse climate and soil, is to that of France, taking the number of acres and of laborers into view, nearly as two to one. Let us illustrate this important fact by reference to one successful cultivator. Mr. Coke, of Norfolk, whose name ought to be familiar with every American as well as British farmer, inherited some thirty-five years since, a great landed estate in Norfolk, the whole rental of which was only £3000, or \$8800 a year. Being an active and intelligent man, he introduced the Tullian husbandry, which consists in frequent rotations of crops, and in sowing in drills; in short, in a more spirited use of the plough and other improved instruments. In the lifetime of this one man, and he is still alive, by the plough alone, and by adopting proper successions of plants, he has raised his rental from \$8800 to \$200,000 a year; in other words, increased the value of his estate 24 times. No speculations in banks, no mining discoveries—no, not even Potosi, in its virgin state when silver was found upon the surface, can show such an appreciation of property as has been produced by skill, enlightened skill, applied to the surface.

Yet all this has been effected by tenants, not owners of the soil, but under leases for 21 years, subject to the hazards of a refusal to renew the leases, by a less enlightened heir. These are facts not to be disputed, and they prove that agriculture, in the short space of one man's life, has undergone improvements of which antiquity had no conception.

Is it possible that the *freemen* of this country, owners of the soil, are not as capable of improving the condition of their farms? Most assuredly, they are so—they are doing it as rapidly as could be expected, and they are alive to the advantages afforded to them by the attention paid to the subject, by well informed men; by the circulation of facts and experiments in useful periodical journals. The very fact that such journals are so generally patronized, is of itself conclusive proof of the progress which they are making in knowledge, and of their zeal to acquire more. The friend of improvement should be as patient as he is firm; changes in habits, and especially in the habits of a retired class of men, must be slow; the manufacturers, vigilant, and combined, eager, and quick-sighted, learn in a week, or a month, any new improvement introduced by their rival, however distant; but the farmer is slow, his interest is less direct; without capital, he dreads a new experiment; but still his progress is perceptible, and unquestionable. We, who have been called by our official duties to watch the improvement in every branch of agriculture, perceive a vast change within the last twenty-five years: new fruits, new roots, and grasses, new modes of culture, greater attention to the preservation and making of manures, are most obvious on every side; our meadows are better ditched, we learn that sand and gravel are better for them, than the finest soils and the richest manures. Still there are some hundred thousand acres of meadow land which produce grass scarcely worth the labour of cutting, which may, by skill and little labour, be rendered the most productive parts of our farms.

Thirty years since, the general complaint was

that our old orchards were perishing, and no new ones planted. The complaint was well founded, as all of us of three score years of age will know. This society, alarmed at the fact, offered more than nine years since, a liberal premium—a premium of itself sufficient to defray the whole expense of planting an orchard of apple trees, and they have continued the premium from that time to the present. No application has however been made for this premium until the present year. This year four competitors presented themselves for this premium.

We need not say how grateful such applications were to us. They were proofs that our premiums had excited the public attention; they gave the satisfactory assurance that the apple tree, the farmer's best friend, was no longer neglected; its fruit, the most profitable production of a farm; its product in cider, the best possible substitute for spirituous liquors, and the abundance of which, if well manufactured, is much more likely to check the use of distilled spirits, than all the associations and too little discriminate representations which the well meant and of pious and excellent friends to virtue could put forth.

At any rate, the abundance of a pleasant and wholesome beverage, of less intoxicating qualities, is the best auxiliary to the laudable efforts now making to diminish the consumption of ardent spirits. In all these views, so many applications for premiums for orchards planted since 1816, and which will be in perfection in the days of our grandchildren, were to be regarded with great interest.—There will be some benefit we hope derived from giving a brief account of these several applications.

The applicant whose orchard we first examined, was Charles Davis, Esq. of Roxbury. To those who knew the spirit and intelligence with which he has managed a rough and neglected farm, it will be no surprise to learn, that in a piece of ground entirely covered with rocks and bushes in 1819, he has an orchard of the most uncommon growth and beauty. The whole number of apple trees planted out by him since that period, is 150; such was their flourishing state that the committee, on leaving his farm, thought that he must be the successful competitor. For his laudable and successful exertions, the Trustees award to him an honorary premium of ten dollars. From his estate they proceeded to examine the orchards of Mr. ——— Baldwin of Milton; there could scarcely be a more interesting exhibition than this farm afforded. Mr. Baldwin, an old revolutionary soldier, took possession of this farm when he was 55 years of age; it was in the roughest possible state; he has made a considerable portion of it a perfect garden; his apple trees planted in 1815 and 1816, are, we believe, the largest and finest in the state. He has also done great honour to himself, and benefit to the public, by forming an extensive nursery of fruit trees, for which we have been, and still continue to be, in a great measure, tributary to the cultivators of other states. When we left Mr. Baldwin, it was with a deep conviction of his rare merit, as a skillful cultivator, and with a hope, that we should be enabled to award to him the society's premium of 50 dollars—but subsequent examinations render this impossible, consistently with our duty, and consciences. We have therefore recommended to the Trustees, and they have agreed to award to Mr. Baldwin, an honorary premium of 10 dollars, for the spirit, in-

telligence, and perseverance which he has displayed, in his nursery and orchard. Some time after, the Committee, consisting of the Hon. Messrs. Welles, Sullivan, Guild and myself, visited the College farm, which was under a long lease to Mr. Nahum Hardy. Mr. Hardy claimed the society's premium. We there found an orchard of eight acres, reclaimed from the wildest state, and filled with a most beautiful display of apple trees, 500 in number. The state and condition of the trees evinced the greatest care and skill, and we congratulate the public, who are owners of the farm, through the medium of the University, on their having a tenant so capable of increasing its value, and who appears to have devoted his capacity, to so good effect. Immediately after viewing Mr. Hardy's orchard, the Committee proceeded to examine a younger orchard, planted by Elias Phinney, Esq. of Charlestown and Lexington. Mr. Phinney selected a most favorable spot, declining towards the south, covered five years since with shrub oaks, and rocks, and there planted his orchard, 400 in number, of the best fruits. The trees were in the most beautiful condition—every superfluous twig carefully, and judiciously extirpated, and their general health gave the best evidence of judicious management. If the premium of the society had been offered to the orchard, in all respects best managed, without any regard to number, Mr. Phinney would probably have carried the premium—but as Mr. Hardy's trees were in an excellent condition, and exceeded Mr. Phinney's in number by 100, the committee consider Mr. Hardy entitled to the society's premium of 50 dollars, and they award it to him accordingly.

The general state of Mr. Phinney's farm was, however, so perfect, considering the means applied to it—there was so much good judgement, in all his operations—he having made also the first, and a very successful experiment in making wine, from the native grape, that your committee recommended, and the trustees have voted, to present to Mr. Phinney a cup, of the value of 20 dollars, with such inscriptions as a committee of the trustees may devise, indicative of his merit, as a farmer. Well then, my fellow citizens, shall it be said, that no good results from these societies? Is it of no benefit that men, who merit well of their country, have a *sure* and *impartial* means of making their merit known? Are our farmers so debased, so indifferent to their own best interests, and reputation, as not to feel excited by the success of others? Why should we presume it, when we see, at once, four competitors, distant from each other, in Norfolk and Middlesex, competing for one of our most important, and hitherto neglected premiums? We hope yet to see a claim for our premium for forest trees. Let us be patient. Improvement in every branch of industry is slow, but certain—in agriculture, more slow than in any other—but as it is *more slow*, so it is more permanent, and more important. Let us all, then be moderate in our expectations, but *firm* in our reliance on eventual success. Our temperate climate, our natural industry, zeal and intelligence, will not deceive us. New-England will be, what she always has been, the nursery of arts, of intelligence, of enterprise, and the abode of virtue, obedience to the laws, and love of liberty. She will never desert her rulers, whether national or state, so long as she is convinced that they consult the *true* interests of the republic.—She will forever cherish agriculture as the acknowledged foundation of all national wealth,

while she will recollect that her numerous harbors, invite her to avail herself of the benefits of foreign commerce, which has raised her to her present comparative importance, and produced a surplus capital, which can in times of peace, only be successfully employed in manufactures and internal improvements, to which the rare mechanical skill, untiring industry, economy and perseverance of her citizens especially invite her, while her numerous and inexhaustible waterfalls afford her facilities, which no other portion of our country can boast. Let our maxim forever be, "A liberal union, without jealousy, of agricultural, manufacturing and commercial skill." By a strict adherence to this liberal principle, the population of New-England must increase in wealth and power—power, of the noblest description, most advantageous to the nation, the power of mind; a moral and beneficent power, which ought not to be the subject of jealousy or envy, but which will command the respect of our sister states, while it will essentially promote *their* best interests. We must be forever supplied with our flour and cotton, from the South, but we shall send them, in return, their own products in a manufactured state, and contribute to their *wealth*, their comforts and their luxuries, at least as much as to our own. Such seems to be the order of Divine Providence. Our comparatively sterile soil, and severe winters, oblige us to be the labourers for our brethren. Local and temporary prejudices may retard, but can never change the order—the beneficent order of Providence.

It would naturally be expected, that something should be said of our present show, but a moment's reflection will convince our audience that this is entirely impracticable. The new arrangements have left no trustee at leisure to make any written remarks, and how could I, engaged in examining and aiding in the decision, of three distinct classes of animals, be expected to say any thing of the others, or of the ploughing match, or the working cattle, of whose respective merits I have no knowledge. All I can say is, that in my own branch of duty the show was highly respectable. Full reports will be made by the chairmen of the several committees, which will assign the grounds of their respective decisions. It would be, however, a gross neglect on my part, if I should omit to notice the renewed exertions of our fellow countryman, Gen. Coffin, to contribute towards the agriculture of his native state. Gen. Coffin, it is well known and will be long remembered, generously introduced, at great expense, a stallion of the cart horse breed, of prodigious power, bone and muscle. His brother, Admiral Sir Isaac Coffin, at various times, has presented to his native state, Admiral, a bull of the finest short horned breed, a cow of the same race; a Herefordshire bull, Sir Isaac, of uncommon beauty, and whose stock to my own knowledge have been of rare beauty of form; a stud horse of the Yorkshire rare, and a mare of the same breed. For these repeated acts of public spirit this Society could do no less than to present to each of these brothers, rivals in good works, their gold medal of fifty dollars.

Gen. Coffin, with the same untiring zeal for the interests of his native country, has purchased three rams and three ewes of the Devonshire Nots, a race of long woolled sheep closely allied to the improved Leicesters. One of these sheep was sheared at a year old on his passage, and gave 13 pounds of long and fine wool. They are as valuable for their meat as for food, the quarters weighing from

30 to 40 pounds per quarter, and as it is said of an excellent quality for the table.

The trustees will endeavour so to place these sheep, as that the beneficent object of the donor shall be carried into full effect. General Coffin, not content with purchasing them, at an age above three score years and ten, has followed them, during their long passage to New-Brunswick, and thence, without delay, from Eastport to Boston, in order, that they might grace the show of this society on this anniversary. He is now present at our festival.

There is no feeling stronger, than that of an attachment to the country in which we are born.—Time and distance have no effect, unless it be in making the feeling more intense. I know of no case, more touching, none in which the strength of that natural feeling has been more strongly exemplified, than in that of these two brothers, who separated from their country in youth, engaged in the service of a nation, now foreign to us, look back with a kind, affectionate and devoted attachment, to the country of their birth. This family, (it is probably well known to you all,) were among the earliest settlers of Nantucket, an island, which has done more than any other spot, to raise the reputation of our nation, for hardy enterprise, and unblemished morals.

Should I receive a single dissentient vote, when I propose the thanks of this assembled body of full blooded yankees, to General Coffin, and his brother, Admiral Sir Isaac Coffin.

[The above motion being put to vote, was carried by a show of hands from every person present.]

REPORT I.

On Bulls—Bull Calves—and Fat Cattle.—JOHN LOWELL, Chairman—ABRAHAM WHITE and TIMOTHY WALKER, ESQs. Assistant Judges.

The Show, in this department, was less interesting than usual, except in the exhibition of fat cattle, in which respect, it was at least equal to any show, held under the auspices of this Society. In the first article of Bulls, there were not more than three, which the Committee deemed worthy of any premium. The best animal of this description on the ground was unquestionably Mr Prince's sired by Admiral, of whose properties he had strong marks; and on his mother's side, he had a share of the blood of the bull, formerly owned by Governor Gore, which was of the best long horned breed of Great Britain. From this bull (Mr Gore's) sprang the famous Chapin oxen (Magnus and Maximus) the first exhibited at our show.—Traces of this breed, I am assured by Mr White, my Colleague, one of the most experienced, and intelligent judges in the state, frequently appear at our "New England Smithfield," Brighton.—The second premium was awarded to John Perry, for a bull out of Cælebs, and from an imported short horn cow, Flora, so that he was a full blooded short horned animal. The third premium, was awarded to Henry Sprague of Spencer, for a bull, a descendant of Mr Parson's bull Holderness; though he had but a quarter part of the imported blood, he showed strong marks of his origin, and it was remarked by one of the judges, that no imported animal appeared to make so natural a cross with our native excellent stock, as Holderness had done. For myself, I must say, that the Fill Pail breed, imported by Col. Thorndike, has appeared to me to have afforded as useful a cross as any

one, which I have witnessed—and in this connection, I may be permitted to remark, that there was a pair of beautiful fat oxen exhibited, originally raised on the farm of Col. Jarvis, of Vermont, which were evidently of the same race with Fill Pail. I shall be much mistaken, if our native breed shall not in the end be as much improved, by this northern Continental race, as by any of the improved races of England. I can perceive no good reason, why they should not be, if equal care be taken to preserve the imported cross, since it seems to be admitted, that the fine short horned animals of Great Britain were produced, at first, by a cross from the Flemish breed of cattle.

In the department of Bull Calves, there was a lamentable deficiency. The only fine bull calf on the ground was owned by J. W. Watson, remotely descended from Denton. For the second premium, we could find no animal in the pens worthy of it.

We awarded the third premium to Nathaniel Kelly of Salem, for a bull calf out of Denton, but he had fewer of the properties of that bull than we have usually seen.

Much was said in favor of a bull of the Yorkshire breed, (as it is unwarrantably called.)—I say unwarrantably because there has been no evidence whatever, offered of the right to such an origin. The pedigree of this animal as alleged was so extraordinary, that it was impossible for the Committee to admit it. The story was, that a heifer cow, was, somehow, carried over to the famous Comet of Great Britain, produced a blue bull, which was purchased by Squire Gilchrist, for 500 dollars, which bull was the sire of the bull offered for premium. The bull offered for premium had not a single feature of Comet, or of his progeny. His form was precisely that of the Westminster breed, of low stature, round body and most enormous thighs. This low, small and round bodied breed, always fleshy, has received repeated premiums at our Show; but it was asserted by competent judges that they cannot be fattened, and that they are entirely out of credit with the butchers. As this is the most decisive test, the Committee rejected the animal. The fat cattle were very fine, both those offered for premium and those exhibited for show. The first premium was awarded to Ira Yeaman of Spencer, for a fat ox weighing 2449 pounds—the second to E. Estabrook of Athol.

The third to Ira Yeaman of Spencer, for an ox weighing 2350 pounds.

Perhaps it will be expected, that I should take notice of other circumstances, attending the late Show, which do not fall within the particular province of any of my friends, and colleagues.

First then, it may be asked, why our Show was less interesting this year in some departments than heretofore? To this, I reply, that there are two principal and sufficient causes for it. First, the establishment of other societies, in every direction, who anticipate us in time—and secondly, that the farmers adjacent to our Show, are not generally raisers of stock. There was an excitement, at first, on the introduction of foreign animals, which has subsided.—It is however surprising, that our farmers do not send down their best milch cows, which will be sure of meeting a more advantageous sale, than at the ordinary fair of Brighton. But if our Show exhibited less value in young stock, it has been every year increasing in interest in its ploughing matches. It is the

best theatre in the state, for such an exhibition, and it has done more, than any other cause, to promote the improvement of ploughs, and the art of using them with skill. After all, one of the greatest benefits resulting from the Brighton Show, is the bringing together people from all parts of the state, from the city, and from the country, creating a friendly feeling among those who were strangers to each other, and like all strangers, a little shy and repulsive. It also gives facilities for the disposal of stock, and of imported animals, and it will rise in public importance, till it vies with some of the great fairs of Europe. It becomes my duty to present the thanks of the Society to His Excellency the Governor and the Hon. Council, and to the other distinguished citizens of our Republic, who by their presence have contributed to the dignity and respectability of our institution. To the gentlemen who have acted as judges, a most laborious duty—to the Selectmen and officers of Brighton, who have done every thing in their power to render our festival orderly and pleasant. To Mr JONATHAN WINSHURP the Secretary and his friends, for their assiduity and valuable labors. To our Horticultural friends, who have loaded our tables with the finest fruits. If we do not again repeat their names, it is because we have done them ample justice at our feast. We cannot omit, however, the fine display of grapes presented by Col. PERKINS, S. G. PERKINS, Esq. and J. PRINCE, Esq.

As to the premiums awarded for newly planted orchards, we thought that our duty would be but half fulfilled, if we had not required the competitors to state their modes of planting, pruning, manuring, and all other particulars, so interesting to the public, from persons of experience and skill. We have received ample replies to our queries, which will appear in due time in the New England Farmer. We now take leave of our agricultural brethren for the present year, assuring them that we shall be, at all times, happy in communicating to them grafts, buds, and seeds which we may possess, and they may want, holding ourselves always the steward of the public, and bound to contribute our time and talents to the cause, to which our lives have been, very agreeably to ourselves, devoted.

JOHN LOWELL, Chairman.

N. B. If, in the hurry and confusion of the Show we may have omitted to take notice of any persons who contributed to its splendor, we beg them to accept as an apology, the very arduous duties which devolved upon us, on this occasion,—duties, to be sure, requiring a very small degree of talent, but which, small as they are, are difficult of performance in such a bustle and crowd. If any gentleman felt himself neglected, we hope he will attribute it to its true cause, the impossibility of the presiding officer's giving his attention at the same moment, in all parts of a crowded room. We would say one word in respect to the unavoidable expense of our dinner. No man who visits our Show, and honours us with his presence, would have the selfishness to wish that the funds of the Society should be diminished—funds sacredly devoted to objects so laudable. Yet, for the two last years, owing to the want of patronage from the city, the Society incurred a loss of 150 dollars each year. This loss arises from the great number of free tickets issued. Yet, would the opulent citizens of Boston propose that we should refrain from inviting the highest Executive and Judicial officers

(Continued on page 110.)

ORIGINAL COMMUNICATIONS.

LEGHORN HATS.

As considerable attention has been paid in New England to the manufacture of Straw Bonnets, I send you an abstract, for the benefit of those concerned, of a communication in the 4th vol. of the Transactions of the Society for the Encouragement of Arts, &c. written by J. & A. Muir, manufacturers of this article.

The Messrs. Muirs tried the common rye grass, crusted dog's tail, sweet scented vernal, and various grasses, wheat straw, &c. and came to the conclusion, after numerous experiments, that rye straw was most suitable of any material they had used.

They sow their rye on light coloured sand, at the rate of twenty bushels of seed to the acre, after having manured well. The crop is cut when in the blossom or milky state. It is tied at the root end in small parcels two or three inches in diameter, placed in tubs, boiling water turned over it, which remains about half an hour, then spread on dry sandy ground, which is considered better than grass, being less liable to take mildew, and turned occasionally. It bleaches in two or three days if the weather is favorable. I believe the top joint alone is used in making hats.

In 1826, Messrs. Muir raised five acres of straw, which produced 12000 scores of plat; which, supposing them to average three scores to the plat, would make 1000 hats, worth, including manufacturers' profit, £5,000 sterling, (\$22,200.) This would give constant employment to 500 persons during the whole year. The consumption of Leghorn hats in Great Britain is estimated at £500,000 per an. Were those all made at home, it would require 700 acres of poor land, and the labor of 5000 persons.—See also *British Farmer's Mag.* for May. J. BUEL.

Albany, Oct. 23, 1827.

NEW VARIETIES OF THE POTATO.

MR. FESSENDEN—The method of propagating new varieties of potatoes from the seeds has been frequently recommended in your paper. Premiums I believe have been offered, by many of our Agricultural Societies for the best varieties procured in that way. I have formerly been rather incredulous as to the utility of this method; not so much so, however, as to deter me from trying the experiment, which, though I do not consider as fully accomplished, promises well.

In the latter part of April 1826, I planted, or rather sowed a few Potato seeds on a small bed in my garden. These seeds came up; but in consequence of the attack of a small insect, in appearance much like a Flea, and the severity of the drought, and, perhaps I should say, my own negligence also, the plants had by the twentieth of June mostly perished; only six remained at that time, and they had such a sickly appearance, that I considered them as deserving but little attention.—All the cultivation they received was to keep them clear of weeds. About the middle of October I gathered my crop, which consisted of about a dozen and a half Potatoes, varying in size from that of a potato ball down to that of a small pea; six of the largest only, one from each plant, I thought proper to preserve. These, which weighed, I presume, not more than two ounces, were, in the latter part of last April, placed in a small hot bed, which I had prepared for sprouting some sweet

potato slips, and covered with about an inch of loam. In from a week to ten days they had sprouted well, and were about showing their tops. They were then carefully transplanted into six hills, distance from each other about two and a half feet. The remainder of their cultivation was as usual—the ground kept clear of weeds, and but little dirt heaped about the hills. In gathering the potato last week, I found the crop very much to exceed what I had expected. The produce of the different hills varied from each other in appearance, and in number from 8 to above 30. In the hill that contained but eight, I found one which weighed a pound. The weight of the 8 potatoes was 2½ lbs. In another hill I found one which weighed 15 oz. The 10 largest in the hill weighed 3 pounds.

In one other hill, which I value most, I found 20 sizeable potatoes which weighed collectively 3 lbs. 2 oz. or 2½ oz. each. In this hill besides several small ones not weighed, there were 10 others which weighed 2 oz. One hill which contained but 6 sizeable potatoes was much earlier than the others.

The quality of these apparently different varieties will not be tested till after another crop.

Perhaps I should state that the soil in which these potatoes were cultivated was good and in good order, though not excessively rich, and with but little manure in the hill.

Respectfully yours,

Franklin, Oct. 23, 1827. P. WARE.

LUCERNE.

MR. FESSENDEN—I wish to add my testimony to that of Mr. LOWELL, and other gentlemen, in favor of this excellent grass, particularly for farmers, who, like myself, are stinted in pasture grounds.

I sowed Lucerne seven years ago, with summer grain. It was sown too thin,—a drought ensued, and the grain crop proved detrimental. It was so unpromising, that I ploughed it up at the end of the second year.

In 1824, I sowed 16 lbs. seed on an acre well prepared, in May, with half a bushel of winter rye. It did well. The last of August, I mowed it, principally with a view of keeping down weeds and the rye, which began to send up seed stocks. In 1825, I cut three tolerable crops, and fed to my stock green. In 1826, when the grass was supposed to have obtained its maximum, I cut it 4 times for green fodder, and gave the field a slight top-dressing of rotten dung in the autumn. This year, my stock has consisted of six cows and four oxen. All my summer pasture would about suffice for two cattle. I fed on ruta baga and hay till about the 20th May, when I began to cut Lucerne morning and evening, and feed, in such quantities as I found my stock would eat up clean. By the time I had gone over the acre, the part first cut was fit again for the scythe. Two cuttings, with the small pasture, in which my cattle were permitted to run, sufficed till my meadows and grain fields were fit to turn into. I cut a third crop for hay, and I have now standing what in New England would be called a fine crop of rowen. I do not find that it has deteriorated in the least. J. BUEL.

Albany Nursery, Oct. 21, 1827.

THE DISEASE IN PEAR AND APPLE TREES.

I beg leave to add my observations and conjectures to the multiplied discussions which have ap-

peared in the New-England Farmer on this subject.

The disease has this year appeared, for the first time, partially among my pear, and pretty extensively among my apple trees. I first noticed it about the 28th May on a young Priestley apple tree. I immediately cut off the limb and found two insects, from one fourth to three-eighths of an inch long, so firmly fixed at the lower extremity of the new growth, as not to be disturbed by the operation of cutting. The exterior of the limb near this place had become black, and the leaves were brown, though the upper extremity of the branch was yet green and fresh. The disease appeared to be spreading in the direction of the descending sap. On cutting, this was more apparent, dark streaks descending down the cambium lower than the bark had yet become discolored, and partially through the sap wood to the pith. Towards evening of the same day, I discovered other trees affected, and on looking for what I supposed my depredator, I found ten or a dozen, enveloped in the dead and curled leaves. These I submitted to the inspection of an entomologist, who pronounced them of the genus *Saperda*, but who could not determine the specific name. The disease subsequently appeared in my orchards and nursery, upon trees planted last spring, and those in vigorous growth; and in several cases the tops of young trees were entirely killed, and a new growth has in every instance pushed from beneath the dead part. I have observed no material difference in regard to varieties, aspect, soil or vigor of the tree. I think the *poir d'Auch* and winter bon cretien, have suffered most among the pears, both in nursery and insolated situations.

Repeated examinations have confirmed me in my first impressions, that the disease is spread by the descent of the proper or elaborated sap, from the point first affected. In some cases a spur, or small branch growing out of the trunk of the tree, has been the subject of attack, when I have observed a circle of the latter to become diseased at the point of junction. That the descending sap is first affected, is apparent from the fact, that the upper extremities of limbs remain fresh and vigorous for days, after the bark and leaves below have become shrivelled, dry and black. The sap continues to ascend, and is elaborated in the leaves, until the albumen becomes contracted by disease; but its descent at the affected portion of the branch.

The conclusion which I have come to, from a consideration of the preceding facts, is, that this disease is produced by the poison of the insect above described, or of some other, injected into the vegetable blood, or descending sap, in the young wood. Of remedies I can suggest none.

In 1803, and three or four subsequent years, I witnessed the destructive effects of this malady at Kingston. Nineteen twentieths of the pears were killed, and serious injury done to apple trees. Some persons believed, that hanging chains, hoops, or other iron upon the branches, tended to avert the disease; and others, that boring into the trunk, and filling the hole with mercurial ointment, had a like effect, with what truth I do not pretend to say. *Albany, Oct. 14.* J. BUEL.

VINES.

MR. EDITOR—Having noticed an article in your paper of the 28th ult. translated from a French work called the *Bon Jardinier*, I have been led to

examine the principles on which these vines are said to be trained. It is, I confess, quite new, and so far as I can see, quite impossible; but perhaps the respected translator can give some explanation that will remove the difficulties under which I labor. If I understand the article, five vines are to be planted within the space of eight feet, 20 inches apart. These are to be trained to a trellis eight feet square, vertically with single stems, from each of which stems two laterals are to be produced, one on each side, "until they have," says the article, "gained 4 feet each."

Now the first question, is, how are the vines which are planted on the right and left of the centre one, to gain in length 4 feet each way when the two outer ones are only 20 inches from the edge of the trellis, and the 2 next only 40 inches from the same point?

The second question is, how are 64 fine bunches of grapes to be raised in a space 96 inches long by 18 inches wide?—for this is the space allotted to this number of bunches, by Mr. Porteau. If the space was chalked out on the floor, I doubt if 64 fine bunches of grapes could be placed within the lines, however close they might be stowed, without bruising.

The third question is, how are vines thus trained, to be laid in the winter? The body of the vine being once formed, it is to remain so, and the only pruning to be practiced is on the first bearing shoots, which proceed from the vertical branches, down to which they are to be cut annually, leaving the eye or bud in the crotch, to shoot to produce a branch the next year, and bear fruit;—thus carrying on a perpetual supply of fruit from the same spot. It appears to me, therefore, that the difficulty of protecting the vines against frost, will place this mode of pruning, in the open ground, quite out of the question.

It is not said why five vines are planted where one would answer the purpose; but I suppose it is with the view of bringing your whole tree into bearing at once; or rather your five trees covering your whole trellis with fruit at once, and sooner than it could be done from one vine. So far, I think the plan a good one, as it saves time and repays the labor of the cultivator one or two years earlier than a single tree would do.

There is nothing in the spur pruning that has not been known for many years. The former gardener of the late Gov. Gore, pruned his vines altogether by cutting close to the eye in the crotch of the wood. But I doubt if the fruit produced from these shoots will be as fine as from branches pruned in the ordinary way. To these, however, who have but little room, and a very sheltered situation, the plan may be useful, whether they use one or more plants for its operation. If they find that the vertical shoots are too near each other, as I think they must be when allowed to grow from 4 to 6 inches only apart, as laid down by Porteau, they can take out every other vertical branch, or place only six on each side of the tree, in lieu of eight. This will reduce the quantity of fruit, of course, according to the number of branches suppressed; and six vertical branches on each side the stem, will give 240 bunches only, in lieu of 320; but I believe the weight of fruit produced will be equally great in either case, and of course the bunches, where there are 6 branches, much larger.

The French mode of planting vines four or five feet from the wall or trellis, and laying the new

shoots annually to make roots until they reach the trellis, differs entirely from the mode recommended by the English gardeners.—The French prefer layers to cuttings for plants, and the English prefer cuttings to layers.—The English gardeners say that cuttings produce fruit sooner than layers; and the French seem to think that the great quantity of small roots you have from layers, produce the most vigorous plants.—My own experience is in favor of cuttings, both on account of their producing, as I think they do, fruit at an earlier period, and because I think they produce stronger and more vigorous plants. Mr Porteau's five vines, made from layers, when the trellis is complete and full, have 165 feet of wood on them.—I have four vines in my garden, raised from single buds, which have made this year from 400 to 600 feet of wood each, beside being loaded with fruit of the largest size, a sample of which I send you. The shoots of the year are of the finest kind—large—and many of them now ripe, 14 feet from their insertion. They must of course have roots that will nourish any quantity of fruit that can be raised in the space allotted for Mr Porteau's trellis, and much to spare. I counted seventy branches or shoots of this year's growth on one of these vines, which I estimated would measure on an average ten feet in length, making the wood on the vine of this year's growth 700 feet beside the old wood and what had been cut off in dressing the vines and heading down fruit bearing branches. This is no fiction—the vines are to be seen by any gentleman who doubts the fact, or whose curiosity may lead him to see them before they are cut down in the fall pruning. I have also a young vine, now three summers since the cutting was put into the ground, (one eye only) that has produced this summer three branches, measuring I think over 40 feet, viz. one vertical and two lateral branches at its base. This plant is therefore in a state of preparation to try the experiment of Mr Porteau's system, and as I believe he has crowded his bearing branches too near to each other, I shall test the eligibility of his system by giving a portion of my lateral, eight vertical branches; a portion of them only six—and a portion only four. My belief is that those that have only six vertical or fruit branches will produce the greatest weight of fruit; and those that have but four will produce the finest fruit and largest bunches.

When vines are planted near to each other, as is recommended by Mr Porteau, they rob each other of a portion of the nourishment that they would otherwise get, and of course they must grow proportionally weaker than either of the same plants would be, occupying the same space alone. In proportion as a plant is vigorous, while in a state of bearing, the fruit is large and may be made abundant; and I believe that one vine trained in the way proposed, may be made to produce more and finer fruit than five vines can in the same space.

If, Mr Editor, you think these remarks pertinent, you may give them a place in your paper as coming from
A BROOKLINE CULTIVATOR.

October 23, 1827.

IMPROVING THE BREED OF CATTLE.

Our attention has been drawn to this subject, by a gentleman to whose liberality, zeal and intelligence this state is much indebted.—The importance of improving the breed of cattle and domestic animals, is made abundantly manifest from the

fact, that lean stock cattle, to the value of 800,000 dollars, are yearly brought from the interior of New-York, and sold in this state, at an average advance of one-third more price, than cattle of a similar description from the interior of our own state. The cattle from New-York are of better breed than ours.—They feed easier and grow larger; and as before stated, are considered worth one third more.

Every body knows there is little or no difference in the trouble and expense of raising one cow more than another, yet one of a particular make and breed, at a given age, will be worth ten times as much as the other. One horse will travel with double the speed, and perform twice the labor of another, and with more ease to himself. So with horned cattle. One cow will give four times as much milk as another, and not cost a cent more to keep her. Also with pigs. Put two pigs of different breeds into the same pen, and with the same food, at a given time, one pig will be found twice the weight of the other.—All this shows the immense importance it is to farmers to procure the best stock. To promote this beneficial purpose, is the aim of the Agricultural Societies, and the design of their exhibitions and cattle shows.

[Pennsylvania Gazette.

HOPS.

Mr David Damon of Stetson, brought into this town last week, and stored for exportation, twenty four bags of hops, computed to weigh more than two tons, the growth of his farm the present season. It may be well for farmers in this beer-drinking country to turn their attention more towards raising this article of produce.—Eastern Republ.

Stores.—It has been a desideratum with house keepers, to find some plan by which they could combine the comfort of a ten-plate stove and the economy of anthracite coal. If we were not deceived, two ingenious mechanics have succeeded in supplying this want. We called in at the Poultry, No. 34 Market-street, yesterday, and saw in full operation a very simple contrivance, but one calculated to effect much good. It consisted of an iron box, with a grate bottom, slid into the furnace or body of a common ten plate stove—the outward end completely closing the entrance, excepting an aperture in the lower part of the box to admit a draft of air. This box was filled with anthracite coal, which burned admirably, and gave more heat than is usually imparted by the common quantity of wood. As this box may be put into the stove and drawn out with as much ease as a stick of wood, there seems no reason why it should not be tried in families—the cost will be about \$1 50 or \$2.—Our opinion is, that it will be found to answer all the purposes of a family for cooking and heating rooms.—United States Gazette.

INCONVENIENCES OF BEING A GREAT MAN.

Cowley, in one of his essays, speaking of a successful votary of ambition, says "He never set his foot beyond his threshold, unless, like a funeral, he have a train to follow him; as if like the dead corpse, he could not stir, till the bearers were all ready. It is an unpleasant constraint to be under the sight and observation and censure of others; as there may be vanity in it, so methinks there should be vexation too of spirit; and I wonder how princes can endure to have two or three hundred men stand gazing upon them whilst they

are at dinner, noticing every bit they eat. Nothing seems greater and more lordly than the multitude of domestic servants; but even this, if weighed seriously, is a piece of servitude; unless you will be a servant to them (as many men are), the trouble and care of yours in the government of them all, is much more than that of every one of them in their observance of you.

CONCLUSION OF MR. LOWELL'S REPORT.

or distinguished strangers? Is not the character of the State essentially involved in the hospitality of its public festivals? and can any honorable and high minded man justify to himself the withholding a trifle, (much less than he would pay to see a favorite actor) when he must be sensible that in affording his aid he advances the character of the State for hospitality, and promotes (what is of much higher moment) a good and kindly feeling between the city and the country?

It is no small moment, that, when strangers from other states, or foreigners, or respectable citizens from the interior, visit our Show they should see a fair representation of the talents, and respectability of the metropolis, and its vicinity. In the interior shows, you always meet the best and most enlightened part of the Society. Should we alone fail in presenting the *elite* of our population? We have, it is true, always many such at our board, men, endowed with every qualification, to do honour to their country—but there are also many, too many, who are unwilling to make a trifling sacrifice—in our judgement, too lightly regarding the valuable practical effects of these celebrations.

REPORT II.

The Committee on Milk Cows, Heifers, &c. at the Show of the Massachusetts Agricultural Society, at Brighton, Oct. 17, consisting of Messrs JOHN WELLES, THOMAS WILLIAMS of Noddle's Island, and JOHN MEARS of Dorchester, Report

That they could have wished more fully to have perceived that whilst the face of the country every where presents the marks of improvement in our stock, whilst the zeal of our farmers is awakened and their judgment displayed by a recurrence to the imported breeds as well as the most careful selection of our native cattle, the pens at our annual cattle show might have afforded, as relates to the dairy, to those who honored the day and its exhibitions, at least more multiplied instances of those improvements that have been effected. This is due to the liberal encouragement of the government to the efforts of the society and to the deep interest which should be taken in what has such intimate relation to the staples of the country. The committee trust, that the good sense of those, whose character is thus at stake, may be relied on, to give at their own holiday, such an increasing display, as the country can make, and is alike due to their own character, and to the many visitors, whose opinions are often founded on the appearance of the annual show of the Massachusetts Agricultural Society. It will be seen however, that there were not wanting many very fine and productive milk animals, as well as beautiful heifers not only amongst those offered for premium, but those for exhibition also.

MILCH COWS.

The premiums on milk cows, your committee award as follows:

To Oliver Shed, of Weston, for his cow, of native stock—the first premium, \$30 00

From the milk of this cow there was made, from June 11th, to Oct. 11th, inclusive, from eight to eleven pounds of butter per week, viz. June and July, over ten pounds; August and September, to Oct. 11th, nearly nine pounds per week. This was supposed to be a native cow of fair appearance.

To James Robbins, of Watertown, the second premium for his cow, of native stock, \$20 00

From the milk of this cow, in May and June, there was made from ten to thirteen pounds of butter, and nearly eleven pounds on an average. Also of fair appearance.

To John Meriam, of Concord, the third premium, for his native cow, \$15 00

It appears that this cow had given for some time, ten quarts at a milking: and held out (it was said) well. Her milk had been made into butter but a short time, and then gave ten and a half pounds per week. This cow was small, but well proportioned.

MILCH HEIFERS.

For the best milch heifer, the committee award the first premium to J. W. Watson, of Princeton, \$15 00

This heifer was of the Holderness breed. Mr. W. states, she came in, in May last, and her calf weighed on the 16th of June, when killed, 23½ pounds a quarter. For several weeks following, she gave 23 to 24 quarts of milk a day, and made ten and a half pounds of butter a week. In September milk was again kept separate, and she gave 16 quarts a day, and made 7½ pounds of butter a week. She had no other than pasture feed.

To Aaron Pike, of Milton, the second premium for a milch heifer, \$10 00

This heifer came in at a disadvantage, in the opinion of the committee, being only 18 months old, she was probably, in part, of the imported breeds, of good appearance, and the animal was thought under all circumstances, thus entitled.

HEIFERS.

For the best heifer, not having had a calf, the Committee award the 1st premium to H. Sprague of Spencer \$12 00

For his heifer 2½ years old. This was ¾ Holderness, and of fine appearance.

To J. W. Watson of Princeton, the Committee award the 2d premium \$10

This was of the Holderness breed, and of good promise.

To John Ellis of Brighton, the Committee award the 3d premium \$8

This was a fine Heifer ¾ Holderness 3 years old.

To Aaron Willard jun. of Boston the Committee award the 4th premium \$6

This animal was but about 8 months old and could hardly be considered more than a calf being still with a cow. But the Committee thought few animals have appeared at the cattle show of more promise. Mr Willard states that the heifer was from his imported Durham cow; sired by the bull of John McIntire of Needham which received the second premium in 1824.

Amongst the animals entered for premium several were thought worthy of notice.

Richard Richardson of Ashby had a cow which calved on the 7th of January; the calf was in high order in March, and then marketed—an other was

put to the cow and disposed of in June. These brought about \$15. A third was at her side excessively fat for which he had refused \$25—This is a rare instance of product, and there can be no doubt of the value of the animal.

Nathan Adams of Medford entered a cow for premium also—this was of the "Fill Pail" Breed of good figure, promise and milch properties—But there was a deficiency of statement in those several particulars which could have entitled her to a premium.

Doctor Benjamin Austin also entered a cow which had a fine calf of the Coelebs Breed at her side—but as to this and several other animals the committee had no particular representation, those who had them in charge being drawn away perhaps by the ploughing match or other spectacles of the day.

The Committee thus close the detail of these observations, made requisite on the distribution of the prizes. Should they in any case be supposed to have erred in judgement, they can only say that in all instances they have been of one opinion.

It would be an ill return for the zeal and meritorious exertions of those who presented fine animals for exhibition, only not to notice those instances which were conspicuous and gave interest to the show.

Mr Parsons exhibited his productive Alderney cow with a full blood yearling—Mr Seaverns a strongly marked heifer of the same breed—Mr Z. Cook of Dorchester exhibited a cow and beautiful calf of the Bakewell breed crossed by Coelebs—There were several other promising heifers from Holderness, Coelebs and Denton.

Mr Mears exhibited a heifer, a cross of Holderness and Coelebs on the Bakewell Breed, 17 months old, of fine figure, which weighed 780 lbs. Mr Welles exhibited 2 heifers of the Herefordshire breed, (Sir Isaac) a cow and 4 heifers from Denton, and several cows and heifers from Holderness and Coelebs.

The Committee repeat that the want of greater fullness in display did injustice to the condition and capacity of the country. But this it is in the power of our Farmers to correct. They will not suffer the apprehension to prevail that they are indifferent to the fruits of their own exertions—that no useful competition can be excited, or that any well advised efforts for the encouragement of agriculture can be unavailing.

All which is submitted

By order of the Committee,
JOHN WELLES, Chairman.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, OCT. 26, 1827.

In our last, we stated the whole number of ploughs entered for the ploughing match at Brighton, to be thirteen, of which ten started for the premium—instead of which we should have said that there were 26 ploughs entered; of which 20 started for the premium; the others could not be accommodated with ground. Perhaps so great a show was never before exhibited in Europe or America, nor was there probably ever a piece of ground so well broken up in so many minutes.

At the dinner at the late Show in Brighton, the following toasts were announced from the chair:

Agriculture, Commerce and Manufactures—may

their respective cultivators perceive at last, that they are copartners, not rivals, and that the success of one does not involve the depression of the other.

The United States—may their "Highways and By-ways" be as smooth as canals, and have as little friction as railways, so that the most distant citizens may become neighbours.

The President of the United States—may the measures of his successors, in all future time, furnish as little ground as his has done, for principled opposition.

The Navy of the United States—the cheapest and safest defence of a free state—may it continue to deserve, and ever receive the cordial support of the whole nation.

The Two great Free Nations—may they be united in advancing liberal and enlightened opinions, nor suffer this great cause to be retarded by personal jealousy or rivalry.

All Societies throughout the Union devoted to Agriculture and the Mechanic Arts—Zeal and success to their efforts.

American Literature—the best security for the preservation of liberty, and without which liberty would be deprived of all its lustre.

Agricultural Journals—A new branch of the Press; the best means of raising the farmer to his first rank, and of promoting a rapid progress of his art.

The late benefactors to the Agriculture of this State, the Messrs COVINGS—Rival brothers, who could find no home so dear as the land of the Pilgrims, nor any employment of their ripened years so grateful as contributing to its welfare.

Among the premiums offered by the Agricultural Society of Salem, New Jersey, is one of five dollars to that labouring man who can give satisfactory evidence that he has been strictly honest, faithful and sober during three years which he has lived with any family or farmer; and another of one dozen silver spoons or five dollars to that member of the same character.

Healthy Society.—At a late term of the Supreme Court in the populous county of Worcester, Mass. there was but one bill of indictment found, and no conviction for a criminal offence. How much have free schools contributed to produce this admirable moral condition among that people!

A hint to housewives.—A lady, who was fond of having her house well arranged, discovered, to the amazement of her acquaintance, the art of making all her servants keep every thing in its place. Even in the kitchen, from the most minute article to the most unwieldy, every thing was invariably to be found in its allotted station; the servants were thought miracles of obedience; but, in fact, they obeyed because it was the easiest thing they could possibly do. Order was more convenient for them than discord; and with their utmost ingenuity to save themselves trouble, they could not invent places for every thing more appropriate than those which had been assigned by their mistress' legislative economy.

Bunker Hill Monument.—The progress in the erection of this great public work is certainly very slow, and, we should think, much more so than is

necessary or can be advantageous. Time is money, saith the sage Franklin, and if the saying be true, we doubt whether the present subscriptions will prove adequate to the erection of the monument. If they do not, years will elapse, to a pretty round number we suspect, before great additions can be made to the funds. It is true that great care and attention are necessary in a work of so much importance, but still some little regard should be paid to the progress of the work. But two courses above the base are yet laid, and within the last fortnight a portion of these have been removed and again replaced. The cause of removal is stated to have been the placing of too much mortar between the stones. The two courses make eight steps in the inside. The work looks neat and substantial, and when finished will do honor to the projectors.—*Charlestown Aurora.*

Brock's Monument.—This is a very imposing structure.—Its height is 118 feet.—It stands upon the Queenston Mountain, near 3000 feet higher than Niagara river. The spot where the gallant General fell, (whose fame this work is designed to perpetuate) lies upon an elevated plain between the Mountain and the village of Queenston.—The bodies of Gen. Brock and his Aid, Col. McDonald, lie in a vault beneath this massive pile.

Black Rock Gazette.

Neatness.—A writer in Blackwood's Magazine says he has travelled up and down Ireland 3500 miles, and never saw a girl so filthy, but that a gentleman might venture to shake hands with her by the intervention of a pair of tongs.

The Duke of St. Alban's intends to commence the shooting season in good earnest. His Grace, it is said, has ordered fifty cannisters of powder, sixteen bags of shot, with two double-barreled guns, with gold touch-holes and armorial bearings, of the value of two hundred guineas.

How the game will fall before such costly instruments! Any body could kill birds with such guns!—*London paper.*

Those who are always endeavoring to be witty, whose every sentence, even in common conversation, is evidently a trap to catch applause, are foolish and disagreeable companions. True wit is always produced without apparent effort.

The National Intelligencer gives an account of a most remarkable cure of consumption, from the use of the tea of liverwort, taken cold as common drink.

An eminent physician in this country says—"that from personal knowledge *in sixteen out of twenty cases* of consumption in females originate in tight lacing."—Pho! there has been enough said upon this subject. None of our fair readers believe it. You might as well attempt to put the tail of a live eel into curling paper, as to make them credit it.—*Bellevue Falls pa.*

A pedlar in New-Jersey, who went by the name of "Chop Johnny," has been committed to jail in that State, charged with having entered a store through the roof, and taken goods of considerable value, which he was found selling cheap.

There is a tree in Mexicana, which is so tender that a man cannot touch any of its branches but it withers presently.

Thomas' Almanack.

This day published by Robinson & Lord at their town and country bookstore, the Old Farmer's Almanack for 1833, by R. B. Thomas, Esq. containing the usual quantity of news, useful and entertaining matter, together with the usual information.

Country traders supplied by R. & L. at the lowest rate. In the press, and will soon be published, the Miniature or Pocket Almanack, likewise the Massachusetts Register for 1833. 11

New England Farmer's Almanack for 1833. And just published at the New York Office, by B. F. Bowen & Co. at the Book-stores generally, the *Old Farmer's Almanack* for 1833. By Thomas G. Lescroart, Editor of the New England Farmer.

This Almanack, in addition to the usual miscellaneous matter contained in similar works, contains a Calendar of the Courts for each State in New England; the Stars and Planets; and 16 pages of agricultural matter on the following subjects:

On Soaking Seed Corn in copperas water.—On Small Farms.—On Charcoal.—On Fish and on a Manner—on Tapes or Pimp in Poultry.—Agricultural Almanack.—On Cider Fruit.—On Stagger in swine.—How to raise Calves, which shall not be diseased.—On the Green of Milk.—How to Fatten Poultry.—A cheap method of preventing the disagreeable sound of Prunes.—Root Stomach, with a new egg.—On Grated Trees.—On Paving walks to Mature Fruit.—On Cattle stalls.—Signs of a good Farmer.—On Drying Peaches.—On the value of Time.—Machines for gathering Clover Seeds, with two illustrative engravings.—Sir Asaph Cooper's Childish Dartment.—Recipes for the Ladies, containing Directions for making several kinds of Cakes.—Miscellaneous, &c.

This Almanack may be purchased, wholesale and retail, of O. D. Cooke & Son, Hartford, Conn.—Hobbs & Fessenden, Brattleborough, Vt.—Isaac Hill, Concord, N. H.—John Prentiss, Keene, N. H.—John W. Foster and Childs & Sparhawk, Portsmouth, N. H.—Pearsall, Little & Ebbotson, Portland, Me.—Wright & Leavine, and John M. Lee, Boston.—Ebenzer Stebbins, Newburyport.—Hilliard & Brown, Cambridge.—Ezra Collier, Plymouth.—E. & G. Merriam, West Brookfield.—Charles Harris, Worcester.—S. Beckwith, Providence.—G. Thorburn & Son, No. 47 Liberty Street, New York.—and by booksellers and trades generally.

For Country Dealers and others supplied on the most favorable terms.

Bull Young Aired.

The above named superior animal, of two years old this summer, 3/4ths of the Improved Durham Short Horns, of 1-4th the Grey Bead, and obtained the *best premium* at Brighton. Is offered for sale at the low price of *one hundred dollars*,—or a cow of the age for 75 or 80 dollars, in any reasonable quantity, on reasonable terms. Apply to JOHN PRINCE, *Buckton, Oct. 25, 1827.*

Mr PRINCE can also sell two or three fine 2 years' old heifers in a milk—of the half blood of the Durham Short Horns, and from first rate native cows.

Fruit Trees.

WM PRINCE, the proprietor of the *Limboe Botanic Garden and Nurseries* at Finsling, L. I. has the pleasure of informing the public, that his nurseries now contain 17 varieties of the Apple, 202 of Peas, 76 of Cherries, 174 of Plums, 45 of Apricots, 41 of Peaches, 20 of Nectarines, 104 of Almonds, 14 of Walnuts, 14 of Quinces, 16 of Figs, 45 of Currants, 13 of Raspberries, 7 of Gooseberries, 50 of Strawberries, 257 of Grapes, &c. of Ornamental Trees. Above 500 of the above kinds of Plants are not to be found in any other collection in America.

The different varieties cannot be otherwise than genuine, as the greatest attention is paid, and nearly all the kinds are introduced from bearing trees. The Cherry, Peach, and other trees are generally of large size. Catalogues may be obtained at the New England Farmer's office, gratis, and orders left there or sent by mail, will meet attention.

Early Top or Tree Onions.

These produce earlier at the bottom and a larger quantity on the top of the seed stalk. The small onions are proper to plant very early in the spring, and should be raised in a good crop and proper cultivation. They should be planted in rows ten or twelve feet apart, and set two or three inches apart, and care should be taken to place the bottom downwards. They soon sprout up, and from their size and vigorous growth, are not to be destroyed by insects. Should they put forth small stalks, as many of the larger ones will, they should be broken off, and one of the biggest, otherwise the onions at the bottom will not be so large. These onions are mild, grow to a large size, and are generally raised with less trouble than the common kind.—Just received for sale at the Farmer Office.

Grass Seeds, &c.

For sale at the office of the New England Farmer, No. 52 North Market Street, Boston, a large variety of Grass Seeds, comprising LUCERNE, POWELL MEADOW, ORCHARD GRASS, HEADS GRASS, RED TOP, RED AND WHITE HONEY-SUCKLE, CLOVER, &c.—with the best assortment of Garden and Field Seeds, to be found in New England.

Also, 50 lbs fresh Canary Seed; genuine English Rape Seed; Hemp Seed, &c. for birds.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

THE INDEPENDENT FARMER.

That man is happy if he be content,
Whose days in rural innocence are spent,
The ground he holds, if his own ear call,
He blames not Providence because 'tis small;
Let gay and toilsome greatness others please,
He loves of homely life the ease.
Can any man in splendid rooms attend,
His precious hours in heedless visits spend,
When in the fresh and heauteous fields he may
In pleasing occupations spend the day;
In rural toils, pre-requisites of ease,
Where health comes dancing upon every breeze,
If there be man whom good men ought to hate,
Dependance and attendance be his fate,
Let him be here's or ambition's slave
Possessing still, but still the more to crave.

DISTRIBUTION OF PLANTS.

By the art of man plants may be inured to circumstances foreign to their usual habits. Though plants in general are limited to certain habitations destined for them by nature, yet some are, and probably the greater number may be, inured to climates, soils, and situations of which they are indigenous. The means used are acclimating and culture.

Acclimating seems to be most easily effected in going from a hot to a cold climate particularly with herbaceous plants. Because it often happens that the frosts of winter are accompanied with snow, which shelters the plant from the inclemency of the atmosphere till the return of spring. Trees and shrubs, on the contrary, are acclimated with more difficulty, because they cannot be so easily sheltered from the colds, owing to the greater length of their stems and branches.—The acclimating or naturalization of vegetables is to be attempted by two modes: by sowing the seeds of successive generations, and by the difference of temperature produced by different aspects. The farmer is well exemplified in the case of the rice plant which is grown in Germany, from seeds raised there, while if seeds from its native country, India, are used, they will not vegetate.

"Some plants," Humboldt observes, "which constitute the object of gardening and of agriculture, have time out of mind accompanied man from one end of the globe to the other. In Europe, the vine followed the Greeks; the wheat, the Romans; and the cotton, the Arabs.

The general effect of culture on plants is that of enlarging all their parts; but it often also alters the qualities, forms, and colors: it never, however, alters their primitive structure. "The potatoe," as Humboldt observes, "cultivated in Chili, at nearly twelve thousand feet above the level of the sea, carries the same flower as in Siberia."

The influence of culture on fruits is not less remarkable. The peach, in its wild state in Media, is poisonous, but cultivated in the plains of Spain and Egypt, it becomes one of the most delicious of fruits. The effect of culture on the apple, pear, cherry, plum, and other fruits, is nearly as remarkable: for not only the fruit and leaves, but the general habits of the tree, are altered in these and other species.

The vine and the fig are not indigenous to France, but are now naturalised there by birds. In like manner the orange is naturalised in the south of Italy. Many herbaceous plants of the

Far East are naturalised both in France and Britain; some, as the cabbage, cherry and apple, were probably naturalised during the subjection of England to the Romans. The narrow-leaved elm was brought from the Holy Land during the crusades. Buckwheat and most species of corn and peas came also from the East, and along with them several plants found among corn only. The country from whence the most valuable grasses migrated is not known. Bruce says he found the oat wild in Abyssinia, and wheat and millet have been found in a wild state in hilly situations in the East Indies. Rye and the potatoe were not known to the Romans. The country of the former Humboldt declares to be totally unknown.

Casting our eyes on man, and the effects of his industry, we see him spread on the plains and sides of mountains, from the frozen ocean to the equator, and every where he wishes to assemble around him whatever is useful and agreeable of his own or of other countries. The more difficulties to surmount, the more rapidly are developed the moral faculties; and thus the civilization of a people is almost always in an inverse ratio with the fertility of the soil which they inhabit. London

"She has finished her education."—Do you observe that young lady with a compressed shape—an enormous French hat—a superabundance of chains, bracelets, crosses, golden hearts, &c. &c. miming her steps through Broadway? "She has finished her education." Observe Miss Prissy with her hair en papillote, her slipshod, her calico morning gown unhooked, her eyes half closed, and her mouth in the sulks, slide to the breakfast table at 9 o'clock. "She has finished her education." Only mark the fine, bold, independent air which Miss Dasaway puts on as she sails through the drawing rooms—a nod to one—a smile to another—Harry, how do you, when do you marry? Bless us, a quadrille. Bennet, play "Go to the Devil, and shake yourself." "Engaged, sir, for the next six cottillions." "She has likewise finished her education." Observe that young lady at the Piano, thrumming the march in the Freyschutz, and squealing out of all tune and harmony, *una voce*, or "Love was once a little boy."—"She also has finished her education."

The fact is, that young ladies at the present day finish their education before they have actually commenced. They mistake the mere elementary and introductory part of their education for the commencement, when, in fact, the commencement may be dated from that period when mind and faculty develop themselves and embrace in a comprehensive manner, all the details and items of early instruction, giving to each, force, stability and finish.

It is before the flower puts forth its genial buds, that it is taken from the parent stalk, and though admired and caressed for a time, it soon withers.

The Liverpool Albion, in noticing this subject, remarks—

"There is a lady, of whom I have some knowledge, that finished her education," by leaving peculiarly good advantages at an early age. She is now a wife and the mother of six children. She plays well upon the piano—sings sweetly—dances elegantly—is very polite, &c.—but her husband must, and actually does, put all the children to bed, and takes care of them through the night; and as to her table, the bread is execrable, to one who has visited his grandmother's pantry—and her

coffee—O! her coffee!—It would cost her head, if the very scent of it reached the Grand Turk's palace—and yet the lady has finished her education."—*N. Y. Enquirer.*

Borrowing.—We have frequently frowned when the following question has been put to us by the newspaper-borrowing gentry:—"Will you lend me your last paper? I only want to read it." Now what in creation do such folks think newspapers are printed for except to read—and if they want them why don't they pay for them, and thus remunerate the printer? A man might with the same propriety, go to a baker and say, "Sir, won't you lend me a loaf of bread—I only want to eat it."

JAMES BLOODGOOD & Co's.

Nursery, at Flushing, on Long-Island near New York.

IN behalf of the proprietors of the above nursery, the subscriber solicits the orders of horticulturists who may be desirous of stocking their gardens and fields with fine trees of the finest sorts and most healthy and vigorous stocks the present autumn.

Bloodgood & Co. attend personally to the inoculating and grafting of all their Fruit trees, and purchasers may rely with confidence that the trees they order will prove genuine.

The subscriber, agent of the above nursery, will receive orders for any quantity of

FRUIT AND FOREST TREES.

FLOWERING SHRUBS,

AND

PLANTS.

And the trees will be delivered in this city at the risk and expense of the Purchaser; the bills may be paid to him.

The reputation of this nursery is so extensively known and has been so well sustained that I take leave to refer those in want of trees to any of the Horticulturists in this city and its vicinity, and if peculiar demonstration is desired, I invite those who wish to be thus satisfied to examine the trees in my garden at Dorchester, procured from this nursery for three or four years past, some of which are now in bearing, all in a healthy and vigorous state.

Catalogues will be delivered gratis on application to

No. 15.

REPORTS

OF THE

MASSACHUSETTS AGRICULTURAL SOCIETY.

REPORT III.

The Committee on the Ploughing Match with one yoke of Oxen, consisting of E. HERSEY DERBY, JOSIAH TITCOMB, Capt. and Deacon ELLIAM CORRY—Report.

There were sixteen entries for ploughing, ten only of which could be accommodated with Lots, which were laid out thirty rods each.

Most of the ploughs were of the improved kind with cast iron mould boards.

The ploughing was to be five inches deep, and the furrows not more than ten inches in width.

Fifty minutes were allowed for the performance of the work.

The shortest time taken was thirty-eight minutes, and the longest fifty-seven.

The Competitors were requested not to hurry their cattle, as the goodness of the work, together with the good management of the Ploughmen, and the general appearance and tractability of the Oxen were to be the principal criterions in awarding the Premiums.

The Committee state with pleasure that most of the ploughing was of the first order. That done by A. A. Wheeler of Concord, would have entitled him to one of the first premiums, had the work been completed within the time allowed.

They award as follows:

1st premium to Joseph Barrett, of Concord	\$15
Same as ploughman	8
Same as driver	4
—	\$27
2d do. to George M. Barrett of Concord	\$10
Same as ploughman	5
The driver	3
—	\$18
3d do. to Samuel Hear, of Lincoln	\$6
Same as ploughman	3
The driver	2
—	\$11

E. HERSEY DERBY, *Chairman.*

REPORT IV.

The Committee on Agricultural Inventions, &c. report as follows, viz.

Messrs. Jackson and Wright presented for premium, in behalf of Mr. Charles Reed, of East Bridgewater, the inventor, a machine for hammering stone; to be worked either by hand, horse, or water power; a certificate was produced, stating, that with four picks or hammers applied to the machine, it hammered and finished handsomely in two hours and a half, a stone measuring on the surface five feet two inches in length, and one foot in width; the depth of stone picked before the finish, averaged three quarters of an inch; the finish was made by applying to the machine two finishers or smoothing pickers—a stone was also produced and shown the committee,

which was hammered and finished by the machine, and the work well executed. The committee thought great credit was due to Mr. Reed for his invention, but think the usefulness of this machine in its present form, has not been sufficiently proved by experiment, and do not recommend a premium.

Mr. J. R. Newell, of the Agricultural Establishment in Boston, presented for premium, in behalf of Mr. Russell Burke, an improved Side-hill-plough. The committee took some pains to test the improvement in this plough, and had a number of furrows turned with it; they could not but notice the ease and despatch with which the mould board was shifted at the end of the furrow, and was of opinion it would answer for many kinds of level grounds; with its present mould board it is calculated to turn up and leave the soil very light, and with a little variation in the mould board, it might answer equally well for sward land; it is simple in construction, and not easily put out of order. The committee considered it such an improvement on the southern side-hill-plough, (one of which is now in the hall of the society) that they recommend a premium of twelve dollars to be paid to Mr. Newell for Mr. Russell Burke.

Mr. J. R. Newell also presented for premium, Mr. Howard's self-governing plough, which is regulated by a wheel at the end of a bar attached to the beam of the plough, and projecting horizontally, and may be easily fitted to the beam of any plough. A single furrow is first struck out in which the wheel is to run, the width of the furrow is given by adjusting the wheel on the bar. The committee saw a number of furrows turned, and the plough went the length of the furrows without being touched by the ploughman or driver; it appeared to answer the description given by Mr. Howard, who produced a certificate signed by twelve persons in Hingham, in which they state that the plough has been used in their presence, and answers the purpose of conducting and regulating itself in such manner as set forth by Mr. Howard, and renders a ploughman unnecessary, except to adjust the wheel, enter the plough in the ground, and turn it when at the end of the furrow, the same person can do all that is required of a driver. The committee were of opinion it would not answer for stony land, or where the surface is very irregular; they however consider Mr. Howard entitled to a premium for the inventions, and recommend the sum of twelve dollars to be paid him.

Mr. John Mears of Dorchester, presented for premium an improvement made by him, in the manner of ironing an ox yoke, also a shackle applicable to the draft chain. Mr. Mears handed the committee the following specification. "The improvement of the yoke, other than has been presented to a former committee of the society, consists in the band encircling the beam, with the ring passing through an eye at the under-part of the band, and firmly secured to it; instead of the staple passing through the beam, thereby weakening the part on which the greatest strain is brought, the staple operating as a pry or lever to split the yoke, whereas the band being secured

with screws on the top of the yoke has a tendency to prevent splitting in any direction; it may also be adjusted to the straight or other circumstances of either ox, by turning the nuts and slipping the band towards either end of the yoke." Of the Shackle, Mr. Mears said it was for chain draft, to connect the oxen to the plough or other instrument, at such distance as is thought most proper, by passing the pin through any link of the chain. It preserves the links of the chain from injury by doubling through the ring of the yoke, it drops the chain from the yoke, and thereby gives a correct line of draft from the plough to all the leading cattle, instead of hooking to the staple as is the common practice; it prevents the yoke from being twitched forward by every irregularity of movement in the leading cattle; it facilitates their travelling and makes it more easy for the ploughman in directing the plough. The committee thought it would be an improvement if the small round bolt that passes through the ends of the shackle, was made of an oval form, it could then pass through the links of the smallest chains used for draft, and the strength not be diminished,—for the improvement in the manner of ironing the yoke, and for the shackle, they recommend a premium to Mr. Mears, of ten dollars.

Mr. Mears also presented for premium, a Scythe-case, for the safe transportation of scythes to and from the salt marsh or fresh meadows lying distant from home; it was a box in which six or eight scythes with the rifles, could be easily and readily packed, and in such manner as to render them secure from being or suffering harm; it was simple and convenient for the purpose mentioned by Mr. Mears, but the committee do not recommend a premium.

A newly invented Lamp-taper and wick, a Pruning-saw set in a small frame with a socket in which a pole was secured, the top of the frame was made sharp for the purpose of cutting the twigs or suckers by an upward or downward motion—and an improvement in securing the Crane-neck hoe plates to the shanks were severally offered for premium. Some ingenuity, and skill in the workmanship was evident, but the committee did not think them entitled to a premium.

Mr. J. R. Newell presented for exhibition a number of articles that attracted attention, and gave evidence of great improvement in many of the agricultural implements. The committee felt great satisfaction in examining his new invented corn-sheller. Howard's double mould board plough which was much improved by the addition of a coulter, and an alteration in the shape of the share to which the coulter was secured, his self-sharpening plough, a hand garden plough, Darby's patent boxes for carriage wheels, Gault's and Crosby's patent churns, and Bailey's improved hand corn mill. And they hope Mr. Newell will be fully remunerated for any trouble or expense incurred, by an increased application at his Agricultural Store, not only for such articles as were exhibited by him, but for any other useful agricultural or horticultural implements.

 best, (household.)

GRATUITIES.

Harriet Gilbert, of Norton, for a hearth rug, 83
 Emerline Patterson, of Boston, for a lace cap, 1
 Maria L. Prouty, of Boston, for do. 1
 Abigail E. Clough, of Boston, for a lace veil, 2
 Mary Hyler, of Boston, for do. 1
 Augusta Delano, of Kingston, for a cotton 2
 counterpane,
 Rebecca W. Brooks, of Lincoln, for fine wor- 2
 sted hose,
 To the Medway Manufacturing Company for 2
 hearth rugs,
 Hannah H. Wheeler, of Grafton, for do. 3
 Mary Fisher, of Westboro', for straw bonnets. 3
 Louisa Brigham, of Marlboro', for specimens 3
 of painting on velvet.
 Sarah Tappan, of Roxbury, for woollen hose, 2
 Miss Heath, of Roxbury, for a muslin mantle 2
 and lace veil,
 Pamela H. Allen, of Bridgewater, for lace 4
 work,
 Harriet Allen, of do. for lace trimmings, 2
 Emeline Allen, of do. for a black lace veil, 2
 Miss Childs, of Roxbury, for do. 1
 To a young lady, of Salem, for a bead belt, 2
 To a child, twelve years of age, for a van- 2
 dyke, of silk weed,
 Fanny Penniman, of Boston, for a hearth rug, 1
 Elizabeth Sherman, of East Sudbury, for a 2
 specimen of artificial flowers,

Among the numerous articles of manufacture offered for exhibition only, the committee noticed specimens of beautiful lace from the Ipswich Factory. The factory prices were affixed to them, which were lower than the prices of imported lace of the same quality. There were two pieces of cotton duck, from the Bemis Watertown Factory, of very substantial fabric. This kind of duck has been for some time in use, and is highly approved. The carpeting from the Medway Factory, an imitation of the Kidderminster, was of an

excellent quality; the patterns were well chosen, and the colors bright and in good taste. This branch of manufacture has obtained a firm footing and is rapidly extending itself in this country.— Among the various specimens of household industry, the patch work carpet, by Miss Bates, of Weymouth; and a bed quilt of the same fabric, by another lady, were much commended, as works of patient industry.

The articles of fancy work were numerous— such as specimens of lace work, ornamental painting on velvet and fabrics of the Turkey Down &c. The Committee having selected those among them which they considered the best, to receive the amount usually awarded in gratuities, are happy to bear testimony to the ingenuity, skill and taste discovered in many of them, which they did not feel authorised to compliment by an award of money.

Mr Munroe of Concord, whose writing and drawing pencils have been noticed in former years, for their good appearance and cheapness, offered a large assortment the present year, and a specimen of the *self painting pencil*. The Committee had no opportunity to make such a trial of them as to test their quality.

R. SULLIVAN,
 SAMUEL APPLETON, } *Committee.*
 EDW. TUCKERMAN,
 JOHN LEMIST.

REPORT VI.

The Committee on Merino Sheep, and Swine, consisting of JOHN HEARD, Jr. SAMUEL JAQUES, Jr. Esq. of Charlestown, and Mr. WM. STONE, Jr. of South Boston, Report,

That the Merino sheep offered for premium this year, were fewer in number, and more inferior in quality, than those in former years; and which they attribute in a great degree to the encouragement that has been given for the increase. The flocks having become too numerous to be supported on the valuable land near the metropolis, have been driven into the interior, and so remote that gentlemen cannot or do not exhibit them at the Brighton show. That they have increased in number, and in fineness of fleece almost without a parallel, since their first introduction into this country, is certainly true; and many of our hills bear evident marks of the fact; if the premiums alone are an inadequate inducement,—patriotism, public spirit, and a desire to promote the best interest of their country, should prompt gentlemen to contribute their share of the gratification of the visitors of the cattle show; and induce others to imitate their laudable example.

In deciding the premiums for Merino sheep, the committee were governed principally by the fineness of the fleece; but they did not totally disregard the form and appearance of the animal.— They had more difficulty in determining, whether they should award any premium, than to whom to award it; and after some consultation and consideration, they have awarded to

Joseph Barrett, the second premium for a Merino ram. \$10 00

There was no ram of so superior a quality as to be entitled to the first premium.

The Merino ewes, presented for premium, were examined with great care and attention, by the committee, in hopes that they might find a requisite number of sufficient fineness of fleece to

award one of the premiums; but having a regard to their duty and responsibility, and the regulations of the society, they could not discover any that were entitled to either of the premiums, for they believed, that as good, and better Merino ewes were not uncommon.

They have awarded to Oliver Tilton, for the best sow, the first premium of \$12 00

To George Everett, for the next best, the second premium, \$8 00

To Jacob Melvin, for the next best, the third premium, \$5 00

To Silas Dudley, for the best boar, the first premium, \$12 00

To Joseph Dudley, for the next best, the second premium, \$8 00

The third premium was not awarded.

To Oliver Tilton, for the best pigs, not less than two in number, nor less than four nor more than eight months old, the first premium, \$10 00

There were none offered, that the committee considered entitled to the second premium.

The committee regret that they have not been able to make a more satisfactory report, upon the most important and useful stock of the farmer;— and hope that the "untiring zeal" of their fellow countryman, Gen. Coffin, to promote the best interests of his native land, and which has been so justly and deservedly noticed by the President of this society, may stimulate our brethren in the country, to more active exertions to improve their stock, and excite in them a spirit of emulation to excel at their annual exhibition.

The chairman of this report cannot close it, without first stating, that in deciding upon the premiums that were to be awarded, he requested the gentlemen, who were associated with him, and who are so generally and justly distinguished for their knowledge, experience, and sound judgment, in the estimation of stock, to examine and decide the premiums by themselves, if they could agree, believing, that their decision must in that event give universal satisfaction, and that the gentlemen perfectly coincided in opinion, and were united in the premiums that are above stated.

JOHN HEARD, Jr.
Chairman.

Oct. 17, 1827.

REPORT VII.

The Committee on working oxen, having attended to the duties of their appointment, report,

That seventeen yokes of oxen were entered for premiums, and of these, fourteen have been subjected to the examination of your Committee. Their strength and docility have been severely tested.—The attention which seems to have been paid by all the competitors, to the selection, matching and training their oxen, bears honorable testimony to the interest which is taken in this important branch of our annual exhibition. After duly considering the claims of the respective owners, as it regards strength, docility, form and equality of match, your Committee have unanimously agreed to award the Society's premiums as follows—

To Luther Whiting of Sutton, for his 4 years old oxen, the first premium of \$25

To Charles Clark of Framingham, for his yoke of 5 years old oxen the second premium of 20

To Col. John Bigelow, of Sherburn, for his yoke of 4 years old oxen, the second premium of 15

To Hiram White of Sutton, for his yoke of 4 years old oxen the fourth premium of 12

To Silas Dudley of Sutton, for his yoke of 5 years old oxen the fifth premium of

All which is respectfully submitted.

By order of the Committee,

E. PHINNEY, Chairman.

Brighton, Oct. 17, 1827.

FOR THE NEW ENGLAND FARMER.

PREMIUM FOR FOREST TREES.

The Trustees of the Massachusetts Society for promoting Agriculture have offered a premium for raising white oak trees expressed in the following terms: for the best plantation of White Oak Trees, not less than one thousand trees per acre, to be raised from the acorn, and which trees shall be in the most thriving state on the 1st of September, 1827.

I apprehend that the purport of this premium has been misunderstood. Two applications (it is said) have been made for it this year—one from Salem for trees, which have only had the growth of the present year, and another from Princeton for 3500 trees on one acre and twenty-two rods, which are certified to be from two inches to 5 inches in height.

Surely no person could reasonably conceive, that seedlings of this size were "Trees" in the common acceptance of the term—They are technically called seedlings.—In using the term "plantations of trees," the Trustees intended trees planted out from a nursery of the size, at which trees are usually planted—say from six to eight feet high—or if sown on the ground, in which they were to stand, that they should have attained that height. It would be a great waste of the money given by the State for this purpose, if the Trustees should award a premium of 100 dollars equal to the average value, through the State, of four acres of land, for one year's growth of oak seedlings, which it would be for the interest of the raiser to plough in and make another application the succeeding year. This hint may explain to future applicants the nature of the Premium, and show them that they can have no hope of success, until their plantations shall have arrived at a size to entitle them to the appellation of trees, and to secure to the State their future growth as such.

It will be recollected, that when this premium was first offered in 1820, three years were allowed for claiming the premium, indicating the opinion of the trustees, that no judgment could be formed in a less period.

A FARMER.

On the importance of Liquid Manure in Horticulture, and the peculiar advantages of Soot as an Ingredient for that purpose.

By Mr JOHN ROBERTSON, F. H. S. Nurseryman, Kilkenny.

Amongst the many advantages which horticulture has derived from Mr Knight's enlightened application of science to its practice, we may reckon as not the least important, his earnest and repeated recommendation of liquid manures. In general liquid manures have not had that importance attached to them by gardeners which they merit. They may at all times be resorted to with advantage; but in a number of instances, and particularly where immediate effect is required, no other manure can be so well applied. To enumerate their uses and preparation, however, would demand more consideration than I am able to bestow;—my present object being solely to point out a material

for the purpose, which I have long availed myself of with success, though it seems to be overlooked by most gardeners—it is soot.

Sir H. Davy characterizes soot as "a powerful manure, possessing ammoniacal salt, empyreumatic oil, and charcoal which is capable of being rendered soluble by the action of oxygen, or pure vital air;" all which component parts rank high as nutritious or stimulous manures. On meadows I have used soot with great advantage in substance, and though sown by the hand, one dressing gave me always heavy crops of hay for two successive seasons; but this is a wasteful mode of applying it, a great proportion of its ammonia, one of its most active ingredients, being volatilized and dissipated in the atmosphere. When dissolved in water, there is no waste: it is all available, and for horticultural purposes I have mostly used it in that state, mixing it up in the proportion of about six quarts of soot to a hogshead of water. Asparagus, peas, and a variety of other vegetables, I have manured it with as much effect as if I had used solid dung; but to plants in pots, particularly pines, I have found it admirably well adapted; when watered with it, they assume a deep healthy green, and grow strong and luxuriant. I generally use it and clean water alternately, and always overhead in summer, but except for the purpose of cleansing, it might be used constantly with advantage; and though I cannot speak from my own experience, never having had either scale or bug on my pines, yet I think it highly probable, as the ammonia it contains is known to be destructive to these insects in a state of gas or vapour, that in a liquid state, if it does not totally destroy them, yet that it will in a great degree check their progress.

Other materials for liquid manures are often difficult to procure, and tedious in their preparation; but soot, sufficient for the gardener's purposes, is almost every where at hand, and in a few minutes prepared.

Were gardeners more generally aware that no manures can be taken up in a state of solidity, by plants as food, and that they can only be absorbed by them in a gaseous or liquid state, to which all the solid manures applied must be previously reduced, before any benefit can be derived from them, they would in many cases facilitate the process by using them in a liquid state. In houses where the rain has not access, it appears to me superior to any other mode of administering manure to trees.

Kilkenny, Aug. 4, 1826.

[Lou. Mag.]

We insert the following statement. It would be difficult to contradict it perhaps in any part.—We submit it as an ingenious conjecture, and shall be happy to correct any supposed errors that may be suggested in it. It met our eye in some publication from which we extracted it.

An etymologist has lately published the following analysis of the English language. "Its vocabulary," he says, "is composed of 6,621 words of Latin origin—4,361 of French—2,068 of Saxon—1,283 of Greek—660 of Dutch—229 of Italian—117 of German—83 of Spanish—11 of Gaelic—81 of Danish—and 18 of Arabic; besides many other of ancient Teutonic, Hebrew, Swedish, Portuguese, Flemish, Russian, Egyptian, Persian, Cambrian, and Chinese.

Gardiner Lyceum.—We are gratified to learn, that Mr. John H. Lothrop, has been appointed

Principal of the Gardiner Lyceum, and will shortly enter upon the duties of his office. Mr. Lothrop has been for several years tutor at Yale College, a situation which he filled with ability and with satisfaction both to the trustees of the institution and to the scholars that were under his charge. We are happy to say that the Lyceum was never in better order. The scholars are remarkably correct in their department, and attentive to their studies.—*Gardiner Intell.*

PEARS.

Albany Nursery, Oct. 13th, 1827.

MR. SKINNER.—The improvement of this excellent table fruit has for many years been prosecuted with zeal, in Flanders. Gentlemen of fortune, amateurs, and nurserymen, have vied with each other in producing superior varieties; and every year brings us acquainted with the names of new kinds possessing uncommon merit. The Flemish gardeners are now enabled to furnish a succession of pears for the table, during the whole year, surpassing in excellence most of the old varieties.

Dr. Van Mons, professor of agriculture in the University of Louvain, has taken the lead in this branch of horticultural improvement. Some idea of the extent of his labors may be formed, from his manner of improvement, and the extent to which it has been carried. His method, is, to select seedlings of promising appearance, bearing analogy in wood, foliage, &c. to some good known variety, and when they fruit, to select seeds of the best, plant them, cull the best plants, and when these bear fruit, to select the best for planting again; and so continue to the fifth and sixth generation, culling the best plants and best seeds for propagation. In this way he has produced an infinite number of fine varieties. It is stated, that in these operations, which have been continued nearly forty years, he has raised eighty thousand seedling pears. When we consider that the same have been employed by him to procure new and valuable varieties of the apple, peach, apricot, and other fruits, we cannot but admire the industry and patience which have distinguished his labors, nor avoid the expression of our gratitude for the benefits which he has conferred on society.

Dr. Van Mons' labors have had the further beneficial effect of stimulating others to imitate his example; and we find among the propagators of choice new varieties, the names of the Duke d'Aremerberg, of Brussels; Count Caloma, Chevalier Neilis, and M. Stoffels, of Malines, &c. The horticultural periodical publications of Great Britain and France, canvass the relative merits of these new pears, and furnish lists of the choicest varieties, drawn up by amateurs and experienced nurserymen. I find them all, with partial exceptions, enumerated in the collection in the London horticultural garden, from which I have received and propagated about thirty kinds, and taken measures to obtain the other most esteemed varieties in the spring.

J. BUEL.

*The experiments of Professor Van Mons afford a hint of its valuable importance to the gardener and farmer; that if seed is selected only from the best plants, a progressive improvement may be depended on. This truth was amply demonstrated by the late Mr Cooper, of New-Jersey. It furnishes another striking analogy between the vegetable and animal kingdoms. Bakewell and other distinguished breeders, succeeded in their great improvement of live stock, by breeding only from the best individuals. Loudon pays you a great compliment in calling you Farmer the best agricultural paper published in any country and I believe a just one; but I ought not to say this, as you have been in Albany twice without calling on me.—*Am. Farm.*

COMMUNICATIONS.

QUESTIONS

Proposed to the claimants of the premiums offered by the Massachusetts Society for Promoting Agriculture, for the best orchards.

1. How many apple trees have you planted out on your farm since 1816—and at what periods? Specify particularly.
2. Of what sorts of fruit is your plantation composed? Be as precise as you can.
3. Was your plantation made on old cultivated fields, or on land never before broken up?
4. In what manner were your trees planted—deep or shallow? did you put stones beneath or above them?
5. How have you managed your orchard, since it was planted? Has it been kept in tillage, or if laid down to grass have you dug round your trees, and at what season?
6. Have you applied tan, or manure of any sort to them, and how often?
7. What has been your mode of pruning? Have you kept the centre of your trees open? At what season of the year have you pruned, and which from experience have you found best, fall, spring or summer pruning?
8. What applications have you made to the bark of your trees? Have you applied any washes and of what sort?
9. Have you suffered from insects on your trees and what remedies have you applied? Has the borer visited them, and what have you done to relieve the trees, or to extirpate the insects?
10. Have your trees been subject to canker, and have you found this to proceed from wounds either by pruning or accident, and have you applied any thing, and what to check the canker?
11. At what distance were your trees set one from the other in every direction.

JOHN LOWELL, *Chairman.*

REPLIES.

TO THE HON. JOHN LOWELL.

Chairman of Committee, (Massachusetts Society for Promoting Agriculture), on Apple Trees.

Sir—The following are correct answers to the eleven questions which you proposed relative to the management of apple trees, together with such observations as opportunity would permit.

1. In the month of April 1820, I planted out 300 apple trees; they were from Sherburne, and of small size. In 1821 I planted about 200 apple trees from New York, likewise small.

2. By Dea. Leland's bill, there are in the first 300 trees, 177 Baldwins, 97 Russets, and 26 Greens—By the New York bill, there are 32 different kinds of fruit.

[These trees were selected by me, then a fellow of the College, from Prince's nursery.—J. L.]

3. The field was a new one, having never been planted but twice.

4. My trees were planted shallow, merely covering the roots—the land being rocky, I deemed it useless to put stones in the holes, (which were large,) and were filled with common earth loam, being mixed with small stones, yet in land without rocks, I should put in abundance of them.

5. The two first years the land was in tillage; the third, fourth, fifth, and sixth years it was in grass; the last year it was broken up and planted; once, while in grass, the trees were dug around in the spring—in summer two shovels of compost

were put to each tree, at the distance of 4 feet, and chopped in with a hoe.

6. For the last two years I have applied apple pomace to the most unthrifty, which has improved their thrift extremely—I have never put any manure within four feet of the trees.

7. I pay no regard to keeping the centre open more than any other part of the tree, being careful that no one limb crowds another, wishing always to balance the top as equally as possible; I take off small limbs at any season, but large ones should always be taken off late in the spring.

8. Three years ago I scraped the bark where it was rough, and put on a wash, made of lime, wash, clay and water, made as thick as white wash.

9. My trees have suffered but very little from insects, except the Borer, and these have not been numerous, for I watched them closely. In no case have I found one where I applied pomace; where I find a Borer has commenced operations, I take my knife and cut them out.

10. I have seldom discovered any canker or mildew, when I do, I rub it off. If I injure the bark when at work among the trees, I take off the bark thus injured, and rub the place thoroughly with dirt; this I do likewise when I take off a limb, which prevents the weeping, equal to composition. I take the whole care of the trees myself, and when ploughing among them I generally plough next to the trees myself.

11. My trees are set in rows north and south—east and west, and exactly twenty-eight feet asunder, both ways; this makes it convenient in planting, as every tree will occupy the place of a hill of corn or potatoes.

Respectfully submitted,

N. HARDY.

[Mr. Hardy is a lessee of the College Farm.]

NEW ZEALAND SPINAGE.

MR. FESSENDEN.—I wish to introduce to the notice of your readers an account of the New Zealand Spinage, *Tetragonia expansa*, which is described at large in the Transactions of the London Horticultural Society. I am decidedly of opinion that it is a very valuable addition to our esculent vegetables. I received but 3 seeds which I sowed in a hill in the month of May; it has spread over a piece of ground at least 6 feet every way, and I could have gathered the leaves in plenty during the months of July and August. It is well known that the month of August is the worst month in the year for vegetables. The common spinage, if sown in the spring and summer, runs almost immediately to seed, and therefore is of but little use: the *Tetragonia* or New Zealand Spinage, seems remarkably well adapted to fill up the chasm in the vegetable market during the summer months; but it will also continue to produce until very late in the fall. Since I exhibited the mess which was cooked on the 10th at an evening meeting of the Horticultural Society, we have had a pretty smart frost, which injured some of it, but not very materially. I can soon gather some, (it was not protected). The New Zealand Spinage is well calculated for small families, which have but small gardens; a bed will afford a mess at any time, without any more trouble than keeping it clear of weeds during the summer and fall; the leaves look much like the common prickly spinage, but of a thicker consistency, and I think with the inspecting committee,

it is finer eating, having no disagreeable taste, but very pleasant; indeed it is so raised in public opinion of late, in London, that it is recommended to plant the seeds in pots in a hot bed, and turn out the plants in the open ground, in order to produce it earlier, and seems to be considered a standard necessary vegetable.

I remain, sir, with respect,
your obedient serv't,
MICHAEL FLOY

New York, Oct. 25, 1827.

From the Halifax Nova Scotian.

AGRICULTURE IN BRITISH COLONIES.

The attention which is now directed to the Agricultural improvement of the neighboring Colonies is a proof of an enlightened acquaintance with the true sources of national wealth. In Canada, we observe, one of the acts, that have lately received the sanction of His Majesty, appropriates the sum of £1600 for the encouragement of the Agricultural Associations established throughout the Province. The bill assigns £505 to the District of Quebec, £910 to that of Montreal, and £185 to Three Rivers; and confers the power on the District Societies of granting premiums to any County Institution in proportion to the number of the inhabitants. Ploughing matches and fairs are incorporated into their system of rural economy; and valuable prizes are offered impartially for the cultivation of green crops, the improvement in the breeds of cattle, and the introduction of domestic manufactures. In P. E. Island the same ANIMS is breathing. A central Society has been established in Charlotte Town; and although its influence has been retarded during the past season, from a Legislative grant being withheld, on account of some difference between H. M. Council and the Lower branch, yet we are aware that a liberal and active feeling exists in its favour, and that seeds have been ordered to a considerable extent for the ensuing spring. Chiefly do we turn our regards to the elastic spirit which is exhibited in New-Brunswick. Convinced at length by the repeated suggestions of the Executive, and by sad but impressive experience, that it was violating all the just principles of political economy to throw their entire dependence upon the timber trade, and thus subject the country in its trade and industry to such paralyzing reverses, the public mind has been aroused, and a portion of its energy has been employed in bringing science to dignify the labours of the plough. From time to time we have announced cursorily to our readers the various steps of their progress—we have copied, as far as our limits would permit, both from the addresses of His Excellency Sir Howard Douglass, and from the reports of R. Simonds, Esq.—the intelligent Secretary of the superintending Institution at Fredericton, such extracts as were most interesting to us, and which at the same time, exhibited the proofs of a patriotic and animating success. During the past season, however, we have been delighted in witnessing the higher enterprise with which this zeal has been inspired. We have marked the evidence of this in the importation of a great variety of finer animals for the improvement of the domestic stock. A few weeks ago we mentioned the arrival of a Mr Greenslade, of the Parish of Springfield, with a large variety of animals, and we have again the pleasure to announce that another importation has reached St John, of 6 Bulls

and 6 Heifers of the approved Durham breed, and seven full blooded Dishley Rams. These are to be sold in the city by public auction on the 25th inst.; and as a loss on the price is invariably incurred, the difference is made good from the provincial funds. Before us lies the list of prizes which are to be paid at the cattle-show to be held at Fredericton on the 9th inst. embracing stock, fruits, and domestic manufactures,—a sum was set apart at a late general meeting for the importation of a number of new implements—and, on the failure of the wheat crop, we notice a strong recommendation to the farming classes to resort to oatmeal! These are all the tokens of a fresher spirit—but in addition to these we would mainly instance the enlistment of the Press in this great cause. We receive no journals now from the sister Province in which a part is not appropriated to the instruction of the farmer. We regard all these signs, like the brightness of a natal star, as revelations of future benefit. It is by the pursuit of this course, so happily commenced, that the advocates of these Provinces will prove to the Ministry our capability of supplying the West India possessions with bread corn, and thus induce them to add flour and wheat to the list of prohibited articles. Could we only accomplish this point, and we know the resources are in the country, there would remain no barrier to our prosperity; and that progress which is already so evident, would receive an impetus, that, like the power of gravity, would speed us on with an ever accelerating motion. A country that can raise maize and the grape, and be uncongenial to the cereal tribes, which perfect in Lapland and Archangel!—we laugh the man to scorn who can make the assertion, and would recommend not an answer but a strait-jacket, as the reward of such ignorant presumption.

ONTARIO CATTLE SHOW AND FAIR.

The first Cattle Show and Fair, of the *Ontario Agricultural Society*, under its second formation, was held in Canandaigua, N. Y. on the 2d inst.—The mildness of the day, together with the lively excitement created in the breasts of our worthy yeomanry, by the re-organization of this favorite institution, caused a very respectable and numerous assemblage of our citizens, from different parts of the country.

From the very short notice of the existence of the Society, it was not to be expected that this exhibition of domestic articles, would be equal, in point of variety, beauty and number, to those of former years, when the society had become systematized, and when sufficient notice of the premiums offered was given, to enable the enterprising farmer and manufacturer to become a successful competitor. The exhibition, however, was such as to convince the friends of the society, of its future usefulness and importance; and as the funds in the treasury are sufficiently ample, to warrant a more general and valuable list of premiums for the next year, the farmer may most confidently expect a full and flattering reward for his industry and perseverance; and the mechanic, for the efforts of his genius, in devising means to lessen the labor of the farmer.

On the close of the examination by the several committees, of the different animals and articles offered for premiums, the members of the society, many ladies of our own and the neighbouring towns, together with a numerous concourse of citizens, repaired to the Town House, where an

eloquent and learned address was delivered by Z. Barton Stout, Esq. of Richmond, which will be presented to the public in a pamphlet form.

The society made choice of the following persons, as officers for the ensuing year:—

John Greig, *President*,
Thomas D. Burrall, *First Vice president*,
Z. Barton Stout, *Second do. do.*
Thomas Beals, *Treasurer*,
Francis Granger, *Secretary*.

EXECUTIVE COMMITTEE.

Bloomfield—Bani Bradley,
Richmond—Joseph Garlinghouse.
Bristol—Richard Simmons,
Naples—Ephraim W. Cleveland.
Gorham—Lemuel Morse,
Farmington—John Lapham,
Manchester—Addison N. Buck.
Seneca—Robert C. Nicholas,
Phelps—David McNeil,
Hopewell—Joel S. Hart,
Canandaigua—Henry M. Mead,
Victor—Darius I. Lewis.

The society after discharging the duties of the day adjourned, and partook of a dinner at Blossom's Hotel.

The following memorial was presented by Z. Barton Stout, Esq. and adopted by a unanimous vote of the society:

To the Honorable, the Senate and House of Representatives of the United States, in Congress assembled: The Memorial of the Ontario Agricultural Society,

Respectfully represents,

That your memorialists are, many of them, engaged in the growing of wool; for which article, they have, latterly, scarcely been able to obtain a market, or remunerating price. That, after having for many years attended, with great care and expense, to the obtaining of the finest woolled breeds of sheep, and the multiplication of their flocks; they now find them, greatly depreciated in value. That they attribute this depreciation to the insufficiency of the laws, intended to protect our woollen manufacture; and the inadequacy of the duties on foreign wool.

Your memorialists view the interests of agriculture, manufactures, and commerce, as inseparably blended, and dependent on one another. The extensive establishment of manufactures, creates the best and most stable demand, for all the products of the soil. Agriculture and manufactures, therefore, must flourish or decline together. When mutually flourishing, they are inexhaustible sources of national wealth; and increase both the ability and inclination of our fellow citizens for foreign commerce.

Your memorialists believe, that if adequate protection to our manufactures and wool growers, should not be granted, that many of the former must be ruined, in their business; and the latter be compelled to sacrifice their fine Merino and Saxon flocks, to the knife of the butcher. The evil to our country, of such results, cannot be too earnestly deprecated.

Your memorialists, therefore, respectfully pray, that your honorable bodies will give this important subject early consideration, and extend such remedies, in the alteration and increase of duties on foreign cloths; and the increase of duties on foreign wool, as you, in your wisdom, shall deem

necessary for the interests of those concerned, and the welfare of our common country.

Canandaigua, Ont. co. N. Y. Oct. 2d. 1847

MERRIMACK AGRICULTURAL SOCIETY.

The fourth annual Cattle Show and Exhibition of Domestic Manufactures for Merrimack County, was attended at Bosswen on Thursday and Friday last. The weather was very favorable, considering the season of the year, and the concourse of people unusually numerous. Every facility was offered, for a pleasant exhibition, by the hospitable inhabitants of Bosswen—and seldom, if ever, have our citizens been more gratified on a similar occasion. The show of neat cattle and stock of various kinds was generally good, and exceeded that of former years. The fancy articles, and articles generally of domestic manufacture, as well as the specimens of vegetable productions, have been seldom exceeded, even in older and more extended Societies. We have not now time to particularize, and it is the less necessary, as the Reports of the different awarding Committees will hereafter be published. We can, without arrogance we believe, give credit to our County of Merrimack, for as much spirit and liberality in the support of agricultural associations, and in the encouraging and rewarding the spirit of improvement, which is happily abroad in the land, as to any other county in the State. More we would not presume to claim, and less it would be fastidiousness in us to refuse.

At 1 o'clock the Society formed in procession, and proceeded to the Meeting House, where after prayer by the venerable Dr. Wood, (himself a pattern of all good works and good husbandry) an Address was delivered by the Hon. Matthew Harvey, President of the Society. The address was a plain, practical, and unassuming performance, aimed at the instruction, rather than the momentary gratification and amusement of the audience. The concluding prayer was offered by the Rev. Mr. Price, of the West Society in Bosswen. After the exercises in the Meeting House, the Society repaired to Mr. West's Inn, where a good and substantial entertainment was provided for them. At the close of the dinner a number of appropriate sentiments were given, under the inspiration of a choice supply of the spirit of *old orchard*.

We are not able, at this time, to give a list of the premiums awarded, nor to furnish any account of the Ploughing Match on Friday.

The following Officers were elected for the ensuing year.—

BOSWELL STEVENS, of Pembroke, *President*.
John Farmer, *Bosswen*, *Vice President*.
John Whipple, *Hopkinton*, *Secretary*.
Samuel C. Bartlett, *Salisbury*, *Treasurer*.
DIRECTORS.

George Kent, *Concord*.
Richard Greenough, *Canterbury*.
Ebenezer Dustin, *Hopkinton*.
James Patterson, *Dunbarton*.
Daniel George, *Warner*.
Josiah Babcock, *Andover*.—*Concord Register*.

Peaches.—Hon. Benjamin Vaughan, of Hallowell, has put into the market this year, ten bushels of very fine peaches, raised on trees growing in his celebrated garden. Though we know of gentlemen in this State, who have succeeded in raising a few peaches for private use, these, we believe, are the first raised in Maine that have been sold in market.—*Gardiner Intell.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, NOV. 2, 1827.

FOR THE NEW ENGLAND FARMER.

VINES.

MR FESSENDEN.—In giving to the public the best translation in my power of Mr Porteau's and Mr Vilmorin's treatise, on the latest and most approved mode of treatment of the Grape in France, I had hoped to render an acceptable service to the public. I had supposed that as we were overwhelmed with British works on the subject, where they force the grape, the French mode, more adapted to our climate, and to common usage, would be interesting, and perhaps useful to us.—It was far from my thoughts to suggest any thing new to your experienced correspondent at Brooklyn, so long and so intimately conversant with horticultural science, and more especially with the grape. I am grieved that he disapproves of the plan recommended by Mr Porteau and Mr Vilmorin, two of the most distinguished cultivators in Europe. But I find some consolation in perceiving that he did not comprehend this plan, and I hope by explaining it, I may remove or abate his opposition to a fair trial of it.

1. His first objection to it arises from an imperfect attention to the text. He supposes that there was a trellis exactly 8 feet square; and he asks, how could the outside vines be trained 4 feet each way on such a trellis? Neither Messrs Porteau and Vilmorin, nor the Translator ever had an idea of such a trellis, eight feet in length only. They conceived the idea of a grape wall, at Thomery, 1000 feet in length, at least, and furnished with a trellis the whole extent of the wall, before the grapes were planted. Your intelligent correspondent will at once perceive, that in such a case, no difficulty could occur in the training, but lest he may still feel a difficulty in training grapes in this mode, I send you a beautiful drawing by my worthy friend, William Dean, of Salona: to whose goodness I was indebted for a loan of the "*Bon Jardinier*."—By this, your correspondent and others who visit you, will see, that the grape may be trained, as described, and it is geometrically demonstrated, that every branch, and every bearing shoot, and every bunch, will have its proper place, without interference. Every ingenious man will at once perceive, that the same vine might be trained equally well in the opposite direction, yet occupying only sixty-four square feet. I have estimated, by calculation, that a wall of many thousand feet in extent, may be entirely covered with bearing spurs, without a vacancy, exceeding six inches, and yet no branch cross each other.—It is a point, susceptible of mathematical demonstration, that no mode of training, but the horizontal one can give so great an extent of bearing wood, without interference. Every departure, at whatever angle, till you arrive at the vertical, constantly increases the difficulty of arrangement, and crowds the fruit more together. I say, this is mathematically demonstrable. The Thomery gardeners have adopted the most economical, and the most simple mode of training. I hope this will remove one objection of your correspondent. The horizontal mode of training has one other good effect; it checks the tendency to useless, and injurious, and enormous growth; and if the grapes thus trained, will bear for twenty successive years, without suffering the spur to exceed one

half inch in length, all we can desire, is attained. So far as to your correspondent's first objection, founded, as he admits, on misapprehension of the plan.

2. The second objection of your correspondent is, that it is physically impossible that 64 bunches of grapes could grow on the space allotted to them by Mr Vilmorin. To this I reply, first, by the sagacious and sound answer of Dr Franklin, when a similar physical objection was made to him,—"Tay." Secondly, I had at the extremity of one branch this year, ten fair bunches, fully ripened, which, if the branch had been cut off, could have been placed without any confusion in a box one foot square. I see no reason why a whole vine, to which Mr Vilmorin allows only sixteen eyes, could not produce and ripen half that quantity in proportion, for that is all he states. But it seems that your correspondent thinks the thing impossible; to which the Thomery gardener replies, it may be impossible in your untried apprehension, but it is a fact, that I do raise and ripen this quantity, every year. Here, then, we have theory in direct opposition to experience. Which shall prevail?

But we are told that Vilmorin has announced a Munchausen story, which would have subjected him to the ridicule of all Paris, before the sheets of his "*Bon Jardinier*," could have been well dried. In order that this folly may rest on its author, and not on his unhappy Translator, we give the original words: "Quand le cinquante cepsera a ses parvins a avoir ses deux bras, long de 4 pieds chaacun, on aura sur une surface de 8 pieds carres 80 coursons, qui etant toilées a deux yeux, donneront, chaacun deux branches, qui produiront chaacune 'au moins,' deux grappes d'excellent raisin, ce qui fera 320 grappes, sur une surface de 8 pieds carres."

Let Mr Vilmorin and your correspondent settle the dispute of physical impossibility between them.

3. The third objection of your correspondent is, that the grapes so trained cannot be laid to be protected during our winters.

In the first place, they can be laid in our old mode as well as before; but one of the excellences of the French mode is, that they can be laid with more ease. We have only to bend the vines down exactly as they are trained—one branch to the right and the other to the left. I am bound before I close, to acknowledge one error in the translation. I took "crossettes" for layers, but it is plain from the subsequent parts, not translated, that the Thomery gardeners only use "cuttings," distinctly called "crossettes non enracinées," and the layers are called "marcottes"—so that the Thomery gardeners entirely agree with your intelligent correspondent, on this point. On one point, he is entirely at variance with the French gardeners. Their objection to the Thomery plan is, that it is too slow; and they plant their vines so near together, because their roots having little space cannot send out these luxuriant shoots which are so much our pride, and are the dread of a French cultivator, whose bread depends on the profit and quality of his vines.

I should not have been so full in my remarks on the severe critique of your correspondent, if I had not known the weight which his experience and authority would give to his remarks; and if these remarks had not stamped the character of folly and absurdity on the treatise of Mr Vilmorin; and of course on the Translator, as incapable of per-

ceiving the absurdity and impracticability of the French practice. I have little confidence, that our first trials of the French mode will have success. Our vines have been too much exhausted by great and useless growths of wood, to expect immediate effects from the French method, such as the Thomery gardeners experience. Least of all should I look to the luxuriant vines of your correspondent for a fair trial, because it would require five or six years of vigorous pruning before his vines could be tamed to a partly fruitiferous state. Nor, if every man had his skill and experience, should I counsel the adoption of the French mode; but for common practice I am inclined to believe it the best; and have thought it a duty to meet at once a denunciation of an untried experiment.

The Translator of the condensed Article.

The Show and Fair of the Litchfield County Society was held at Litchfield, on the 17th inst. The exhibitions are said to have been more numerous and interesting than have heretofore been known for several years. An Address was delivered on the occasion by Mr J. P. Brace.

HEMP.

In reference to the article which appeared in our paper of Saturday last, taken from the "*Spirit of '76*," we learn that the Commissioners of the Navy have been desirous, for years past, to employ cordage made of American hemp on board the vessels of the navy, but have been hitherto discouraged, by the unsuccessful result of various experiments on that subject.

The failure, it is well understood, is not attributable to any defect in the quality of the article, but to the improper mode of its preparation. Dewatering, which is understood to be a more simple process, has been resorted to, instead of the old and well tried method of water-rotting, and hence the staple of the article has been materially injured, and the strength of the cordage proportionally diminished.

When the growers of American hemp shall adopt the last mentioned process, there can be no doubt, that the substitution of native for foreign cordage, in our national vessels will be a speedy and a certain consequence.—*Vid. Int.*

The following gentlemen were elected officers of the *Rockingham Agricultural Society*, at its late meeting.

JOHN FOLSOM, President, in place of Col. Cilley resigned.
John Harvey, Vice President.
Samuel Cushman, Treasurer.
Ichabod Bartlett, Cor. Secretary.
Samuel T. Gilman, Rec. Secretary.
Joseph Towle, Marshal.
George O. Hilton, Dep. Marshal.

The Governors of Maine, New-Hampshire, Massachusetts, and Connecticut, have appointed Thursday, the 29th of November next, for a day of general Thanksgiving and Prayer.

It is estimated, that there are 15,000,000 of square feet of Salt Works in Barnstable county, Massachusetts; producing not less than 450,000 bushels of Salt annually.

The number of sheep and goats in the State of Massachusetts, in the year 1784, according to the valuation taken in that year, was 224,307; cows

127,167; oxen and other neat cattle, 162,552;—swine 85,671.

The great Cattle Show and Exhibition of the Agricultural Society of Pennsylvania, took place on Thursday and Friday last. These exhibitions have already had the effect of stimulating the exertions and enlivening the practice of the Pennsylvania farmers. John Hare Powell, Esq. one of the most active members of the Society, has probably done more towards improving the breed of cattle, than any other man in the country. His beautiful farm on the Schuylkill presents those fine Durham short horn cattle, which are exhibited at the cattle shows. For some of these which he has imported, he has given as high as six or eight hundred dollars; and his calves from this breed are so fine, that they sometimes command \$200 a piece.—*Poulson's Am. Daily Adv.*

One hundred and twenty-five copies of the Declaration of American Independence, with fac-similes of the signers, were sold at auction, recently, in London, for thirty five guineas.

On the employment of the wood and bark of the Chestnut tree in dyeing and tanning.—The bark of the chestnut tree contains twice as much tanning matter as oak bark, and nearly twice as much colouring matter as logwood. The colouring substance of chestnut bark is to that of Campeachy logwood exactly as 1.857 to 1.—Leather prepared with this substance is more firm and solid, and yet more supple. This bark is the best substance for making ink; mixed with iron it becomes a blueish black. The liquor drawn from this bark appears blue at the outside, like indigo; but it gives on paper the finest black. In dyeing it has a greater affinity for wool than sumac has, and in other respects it differs very little from sumac and gall nuts. The colour obtained from this substance is unchangeable by air and light.

A rare instance of honorable conduct.—About ten years ago, a gentleman engaged in mercantile pursuits in the interior of this state, met with reverses, gave up all his property, compounded with his creditors, and was fully and unconditional discharged by them. A few days since he called upon them respectively, several of whom reside in this city, and paid every farthing of the original debts, with interest to this time, amounting to near \$20,000. We are happy to add that his creditors here, presented him with a service of silver plate, as a testimony of their high regard for him personally, and as their admiration of the exalted principles by which he had been governed.

[*Albany Argus.*]

NEW-YORK HORTICULTURAL SOCIETY.

At a regular meeting of the Inspecting Committee, on Tuesday evening the 16th inst. seven heads of very fine and delicate Broccoli, weighing about two pounds each, were presented by Mr Wilson—Six fine real blood beets, weighing 15 lbs. 6 $\frac{3}{4}$ ounces, by Mr Hattrick—Several apples from Monmouth county, New-Jersey, sweet on one side, and tart on the other, presented by Mr. Cothen.

Mr Floy exhibited a fine kind of Double Dahlias; also Silver, Orange, and Scarlet Cockscombs. Mr F. also presented a basket of New Zealand Spinage, the seeds of which were sent to the Society last spring from Paris, under the name of *Tetra-*

gonia Cornuta. Some of it was cooked and found to be of a very mild and agreeable taste.—The plant is described at large in the London Horticultural Transactions, by the name of *Tetragonia Es-pansa*. It is a very useful vegetable and will, undoubtedly, through the instrumentality of the N. Y. H. Society, be speedily introduced into our markets. It grows very luxuriantly, is hardy, and capable of standing heavy droughts, and not easily injured by frost. It should be sown early in the spring. Four or five plants will supply a small family during the whole summer and fall. In this respect in particular, it is decidedly preferable to the common spinach, which requires to be sown several times in the course of the summer.

A. Y. Farmer.

See also Mr Floy's communication, on page 116 of this day's New-England Farmer.

Consumption.—A medical gentleman residing in Prince William County, Va. has addressed a communication to the editors of the National Intelligencer, describing the powerful effects of a simple plant called *Liverwort* in a case of formidable pulmonary disease. The patient had been for five years subject to distressing affection of the lungs, during which period he frequently discharged from half a pint to a pint of blood at a time. He was greatly reduced, and so far gone in what his friends thought consumption, that they entirely despaired of him, and abandoned all hopes of his ever being restored; as the ordinary remedies, and almost every thing that could be thought of, had been tried in vain.

In this desperate situation he was advised to try the *Liverwort*, in the form of infusion, or a strong tea, to be used cold, as a common drink. In less than ten days, he derived the most positive benefit, and in four weeks, every violent symptom had vanished: no cough, no expectoration or discharge of blood or matter—a fine appetite, general health much improved, gaining flesh and strength rapidly and such a change in his whole appearance, as both astonished and delighted every friend he had. He is not the only one that has experienced its salutary influences. There are several others in his neighborhood who have been laboring under breast complaints, or pulmonary consumption, and who have been relieved by it.

Subscription.—Select Table Grapes.

MR. ANDREW PARMENTIER, Proprietor of the Horticultural Lot on Garden at Brooklyn, two miles from the City of New York, offers to the public, by subscription, one dozen of the most select and choice GRAPES, for the table, many of which are in a bearing state, and can be seen at his establishment with the fruit, and other fine sorts of planting.

Names of the table sorts.

No. 1. White Chasselas.—2. Chasselas of Fontainebleau.—3. Yellow Chasselas of Thonery.—4. Golden Chasselas.—5. Musk Chasselas.—6. Royal Chasselas.—7. Large Maroc.—8. Black Muscat.—9. Violet Muscat.—10. Black Muscat.—11. Grey Muscat.—12. Large Frankenthal.

The Subscribers will receive their Vines between the 15th of Oct. and 15th of Dec. and the 1st of April and 15th of May 1823, free of freight or postage to New York, well packed in moss in such a manner as to go several hundred miles farther than New York. Mr. Charles Swan, Grocer and Tea Store, No. 357 Broadway, and Messrs. Grant Thorburn & Son, Liberty-St. New York, are empowered to receive the subscriptions. Price six dollars the dozen, and the plants to be paid for when delivered.—The subscription receipt will be accompanied by directions on the best mode of cultivating and planting the vine. The same sorts of Vines may be had separately. Price 75 cts. with package, except the Golden Chasselas and Royal Chasselas.—Mr. P. will designate the different kinds of most congenial to each soil and situation for to make vineyards and furnish the roots at 25 cents each. Mr. P. warrants his vines to grow, and will replace those the spring or the fall after the plantation, that is not growing; provided, the person has followed his directions. References for the above assertion, to Dr.

Vanderwever, Col. Gibbs, Messrs. Wm. Page, Hubert R. Schenck, Richard Arden, John Farr, and all the gentlemen who have bought their vines of me.—For full and the best mode to plant the vines in a sand or light soil, which is the best for the vines. Orders can be directed to Mr. P.'s establishment post paid.—Mr. Swan will deliver gratis, the Laws and Catalogue of Fruit and Ornamental Trees of N. Y. which may be had of his agents at Boston, Mr. Russell, New-England Farmer office—Hartford, Mr. P. W. Roll—Lowell, Messrs. Luther Tucker & Co.—Putnam, Mr. Lewis F. Allen—Riverside, Mr. H. Mangray.—*Brooklyn, Sept. 23, 1822.*

Superb Bulbous Flower Roots.

Just received, of the office of the New-England Farmer, direct from the most eminent dealers in Holland, a large assortment of bulbous flower roots, comprising the finest varieties of—
Double white hyacinths, with purple eye
" pure white hyacinths
" red diamonds de Flora
" dark blue hyacinths
" yellow rose hips
" porcelain blue hyacinths
" early clarendon tulips
" red donat. Eicomma hyacinths
" white and purple Franklin hyacinths
" jonquilles and lilies
" yellow melstoe
" white hyacinths, with yellow eye
" belle. Agathe hyacinth, porcelain blue
Large yellow crown imperial; large red do; gold striped do; silver striped do; Persian fritillaries; Chinese yellow tiger lilies; large yellow crocus; yellow poppy lily; cloth of gold crocus; princess Elizabeth hyacinth; superb dragon flower; polyanthus narcissus; purple crocus; mountain lilies; gold crocus tulips, &c. Like-wise, plum and colored bell glasses. Purchasers may rely on the excellence of the above, as they were not purchased at auction, but are imported direct from the best florists in Holland, and are remarkable for their size, beauty or delicacy of tint.

Conservatory Bulbous.

Persons in want of superior varieties of Glass conservatories, can procure the bushes, by sending their orders to the office of the New-England Farmer. They are from Glasgow in 7 $\frac{1}{2}$ feet; and from London in 11 feet. Some may be seen at the office measuring 3 and 4 inches in circumference; and of white, red and yellow colour. The price will not exceed \$1 per bush.

At William's Garden.

Just received at the New-England Farmer office, a further supply of 25 Dutch's American Gardeners. This work is the most elaborate of the kind ever published in this country, comprising ample directions for the management of the kitchen garden, fruit garden, ornamental, nursery, pleasure ground, flower garden, green house, hot house, and forcing frames, for every month in the year.

500 Grape Vines.

For sale in Charlestown, by Samuel R. Johnson. The above choice vines are of the *Superb* species, all raised from cuttings, and are from 3 to 4 years old, most of them in a bearing state. They are for the above may be supplied at J. R. Newell's Agricultural Establishment, No. 55 North Market Street, or by the subscriber in Charlestown, price for each vine is from twenty-five to fifty cents, according to its age and size; and the above vines have been trained to trellises, and assured to be as healthy as any can be presented for sale. SAMUEL R. JOHNSON.

Furman's Greater Cider Mill.

We the undersigned, having seen Joel Furman's Greater Cider mill in operation at the farm of Mr. John Parkinson in Roxbury state as our opinion that the principle of said mill is well calculated for the purpose of grinding apples for the cider press, and superior to any thing of the kind we have seen. We witnessed its operation, and found its motion to be equal to about 80 revolutions per minute. At this rate it ground one bushel of apples in 55 seconds, with an eight inch cylinder. We are also of opinion that with a cylinder with longer joints, vegetables might be very advantageously cut for the use of animals. Roxbury, Oct. 27, 1822. JOHN PRINCE, JOHN PARKINSON, NATHAN SMITH.

If the undersigned certify that I was present at Mr Parkinson's at the time the said mill was in operation, and am fully of the opinion that it will perform all that is above stated.

J. R. NEWELL.

For further information, application may be made at the Agricultural Warehouse, No. 32 North Market Street, Boston.

New-England Farmer's Almanack for 1823.

Just published, at the New-England Farmer Office, and for sale by BOWLES & DEARBORN, 7 Washington Street, and at the Bookstores generally, the *New-England Farmer's Almanack*, for 1823. By Thomas G. Fessenden, Editor of the New-England Farmer.

Typo-graphia.

An historical Sketch of the Origin and Progress of the art of Printing, with practical directions for conducting every department in an office; with a description of Stores, and Librery, illustrated by Engravings, Biographical Notices, and Portraits. By T. C. Hansard. Just received and for sale by R. P. & C. WILLIAMS.

Miscellaneous.

From the New York Bazaar.

CHRISTMAS CEREMONIES.

England was every England when Old Christmas brought his sports again... The practice of decorating churches and apartments with evergreens at Christmas, is supposed by many to allude to the people's strewing branches in the way of the Saviour when he entered Jerusalem...

But the practice of ornamenting places of worship with evergreens springs from an earlier date... The Druids decked their houses and places of worship with evergreens in December, that the Sylvan spirits might repair to them and receive tribute by the frosts and storms of that chilling season...

In the oldest ages the Mistletoe was held precious for such uses over every other plant or tree... The Druids venerated it for its mystical origin... Growing as it is upon the oak, without resembling it, they deemed it a miraculous production...

The manger pie, and the Christmas pie, those favorite peculiarities of the Christmas festival had also their appropriate derivation... The former being a compound of the choicest productions of the East...

The mention of the "Christmas log" will kindle the feelings of every New Englander, as another well known feature of this joyous festival... It was in Old England the great indispensable, to have a huge heaped-up, over-heaped-up, all attracting fire...

The day that gave To man a sister—his doom to the slave!

Peace.—The name of peace is sweet and lovely; it is the calm of the world, the smile of nature, the harmony of those gentle and well-tuned airs...

A writer in the Worcester Spy, condemns the present militia system, and states that the annual expense of the militia reviews in Massachusetts alone is \$217,000 per annum...

Allan Cunningham.—This excellent poet has written much, and among all the effusions that he has offered to the world, not a word or a line can be found that can offend the most fastidious...

Sleep.—Sleep has often been mentioned as the image of death; "so like it," says Sir Thomas Brown, "that I dare not trust it, without my prayers..."

A Vermont paper, in remarking upon the late publications on perpetual motion, says "when a man shall contrive to raise himself by pulling at the waistband of his breeches, we shall then have perpetual motion."

Rattle Snakes.—A few miles from this place, in Saratoga county, a young man took his gun one day last week, and went up the side of Palmertown mountain... He then took a club and commenced killing, and before they could make good their retreat, he had forty of them lying dead before him...

[Glens Falls Observer.]

Manufacture of Salt.—The New Bedford Courier estimates the quantity of salt works in the counties of Barnstable and Bristol, at 1,634,700 feet... This is equal to a superficial surface of 16,357,400 square feet of vats, for containing the salt water...

Longevity.—Old Arthur Wall, of Wake Forest, (North Carolina) completed the hundred and ninth year of his age on the 15th ult. A few days ago, he walked three miles, but said he was somewhat fatigued, and thought he discovered by it, that old age was creeping upon him.

Orchard Trees.—WM. PRINCE, the proprietor of the Linwood Farm, Gardiner and Ansonia, in Falmouth, Me., has the pleasure of informing the public, that his nursery now contains 172 varieties of the Apple, 292...

Full Young Animals.—The celebrated superior animals of two years old this summer, 18th ult. of the Improved Durham Short Horns, of 141 lbs. "pure blood," and obtained the first premium at Brighton...

Ardena Sheep for Sale.—One hundred, the greater part Ewes, at Winchendon, county of Worcester, Mass. Apply to Seth Tucker Jun, of said Winchendon...

Extensive Nurseries.—FOR sale at the KENNERLY Establishment in NEWTON, one mile from Acworth, a full and complete assortment of the greatest quantity and variety of Fruit and Forest Trees known at any other place in New England...

Written orders addressed to JOHN or WILLIAM KENNERLY, and directed to the BRIGHTON POST OFFICE, will be speedily received and punctually attended to... N. B. Great care will be taken to preserve the roots.

Early Top or Tree Onions.—These produce onions at the bottom and a bunch of small ones on the top of the seed stalk... They should be planted in rows two or twelve feet asunder, and set two or three inches apart...

The day published by Richardson & Lord, at their town and country book store, the Old Farmer's Almanack for 1828, by R. B. Thomas, Esq. containing the usual quantity of new, useful, and entertaining matter, together with the sun's declination...

THE FARMER is published every Friday, at \$3.00 per annum, or \$2.50 if paid in advance. Gentlemen who procure fire responsible subscribers, are entitled to a sixth volume gratis.

NEW ENGLAND FARMER.

HORTICULTURE.

TO THE EDITOR OF THE NEW ENGLAND FARMER.

VINES.

You will do me the favor to acknowledge the following errors of the press, in the extract from the original French of Porteau's and Vilmorin's Treatise on Grapes; errors, I know to be very natural in printing a foreign language, from a badly written copy.

"The points over all the participles were omitted—*tailles* was put instead of "*tailles*,"—*yeaux* for "*yeux*"—*donnerent* for *donneront*—*quis* for "*qui*"—and *produirent* for "*produiront*." "*Grappes d'excellent raisin*" is so put in the original, and I suppose is a French idiomatic expression, though it would be vile grammar in our language. These are trifles, but might be imputed to me. I shall now give you the reasons of Mr Vilmorin, which I omitted in the translation, because I thought no reason necessary in support of authority so high; and I believed that the public would not require them—and, indeed, to judge by the numerous thanks I have received from intelligent men, I should suppose that I was not mistaken.

"TRANSLATION."

"We admire, say Porteau and Vilmorin, as many others do, those branches of the vine, which are carried to 200 feet in length,—and we admit, that there are parts of a wall, which can only be covered by branches, the roots of which are very distant, but we recollect, that when a vine has extended beyond a certain distance, it no longer gives fine bunches, but at its extremities—*the spurs of the centre no longer produce anything but small bunches, [grapillons] and soon die of inanition.* This inconvenience doubtless occurred to the Thomery gardeners, and by an admirable calculation, they fixed upon the length of eight feet for each vine. It follows, from this arrangement, that the sap is equally distributed to all the spurs—and that all the bunches are well nourished, and more beautiful."

"We should also, here remark, that, though the branches at Thomery are only eight feet long, they do not throw out extraordinary shoots, because, the plants being set at 20 inches distance only, apart from each other, their roots dispute or contend with each other for nourishment. The cover of the wall also, extending over the vine 9 or 10 inches, contributes to check the growth, *not sinning by any excess (ne penchant par aucun excès)* its fruit has all the qualities which it is susceptible of acquiring."—Such is the strong, and to my understanding, the sound language of men, living in a country, which has cultivated the grape ever since the invasion of Julius Cæsar, before the birth of our Saviour, and which raises one million of pounds of grapes, for every pound, raised in England & America united.

Knowing, that your "*Brooklyn*" correspondent has set his face against this French mode of training, and that he is, from his long experience, and great success, a host in himself, I have set myself to work, to brush up my old acquisitions on this subject, by revising the English and French authorities on the culture of the vine. The result

is, that in the British works, I find nothing but chaos. As you would naturally expect from people, who raise the grape as a luxury only, no two writers agree with each other in the proper mode of training, or pruning. Every new writer from Hitt to Hayward, has his own scheme. I would not intimate, that in forcing grapes the English gardeners are not eminently successful. But they are so in twenty different ways. They are so attentive, so neat, so utterly indifferent to expense, that success is hardly to be avoided. In France, on the other hand, it is an affair of subsistence—it is the great staple of their whole country, even to the north of Paris—yes, to a latitude 4 degrees north of Quebec. From the history of the culture of the vine in France which I have carefully gone over, I find, that the plan of planting their vines very near to each other, in all the middle, and especially the northern provinces, has been of high antiquity. In 1763 an innovator appeared in France. Mr Maupin in his treatise, entitled, "*A New Method of Cultivating the Vine,*" contended that the vines should be planted 4 feet from each other. All France was alive to this question.—The experiment was fairly tried and failed, and the French returned to their old system of close planting, and of short pruning. This is the true history, and, if ever the vine shall be successfully cultivated here for profit, not for luxury, for the market, not for the dessert of the opulent, I predict that we shall adopt that mode.

All the French writers admit, that where the soil is very rich, and the situation sheltered by hills, you may extend to much greater length your bearing wood, and permit more luxuriant growths, and that, in such places, your bunches will be much larger. Such is the fortunate site of your intelligent correspondent at Brooklyn. He enjoys natural advantages beyond the power of art, and he has added to them artificial ones, surpassing his natural benefits. Sheltered from all cold blasts by a lofty hill—his garden in rapidly descending terraces, protected also by a noble wall, if the grape were left to itself it could not fail to flourish. Transport his vines in their present state, to an exposed plain, and transport with it the intelligent owner, and not one bunch of his grapes would ever ripen, on espaliers, unprotected by a wall, if he should pursue his system of permitting one vine to make 700 feet of new wood in a season.

His experience is no better adapted to common use, than that of a man, who had only cultivated the vine in a grape house. Every one, who knows his seat is sensible, that more judgement could not possibly be shown, than he has done—but it is a judgement exercised in a sort of Paradise.—My fate has been far different. To me, every possible natural disadvantage has been opposed. I think, therefore, for my fellow sufferers, and I feel persuaded, that for them, the cheap, simple, moderate training of the Thomery gardeners promises success. I have a happy chance of trying the experiment, this year, for a friend. I have planted against a common country stone wall, a set of vines, which I shall train on the Thomery plan, and I promise to give the public an impartial account of its success. My own vines (35 years old) do not in my judgement, offer a fair field for

the experiment. Too much has perhaps been said on this topic, yet too much can hardly be said, if we can succeed in making the culture of the European hardy grapes practicable.

I was much pleased, with a thought of the young Mr Kenrick, of Newton. Invited by the account of training the grape, at Thomery, he said, he was resolved to try a quarter of an acre, but never to extend them above the first rail, say 6 or 9 inches from the ground. In this way he could protect them on the north by boards, and have successive rows not farther distant than currants are planted. I may as well throw off all disguise of fictitious names. I. LOWELL.

Roxbury, Nov. 6, 1827.

ISABELLA GRAPE.

This grape has been introduced into the interior of this state, with great success. A Lockport paper mentions that a vine brought to that village from Prince's garden, Flushing, three years since, has borne between 5 and 6 bushels of grapes, of a quality and flavor superior to any other kind heretofore introduced into that part of the country.—The grapes are about the size of a musket ball, and grow in large compact clusters. The trouble and expense of covering with earth for the winter, which attends almost every other species of grape cultivated in this country, is saved by the cultivation of this. It is found to do well, by remaining upon the trellis during the severest winters.

We look forward with much hope to the general cultivation of the vine in the fine valleys of the west, and to the manufacture of those light wines, which may supersede the use of rum and whiskey—the last of which is now manufactured so extensively and cheaply, that it can be sold for four cents per pint. [N. Y. Statesman.]

SHADE TREE.

"When to build, is the question a man should reflect upon a great while, and perhaps not build at all; but when to plant he should not reflect, but plant immediately."

Now is a good time to plant and transplant the generality of shade and forest trees. We are all aware of the very great addition that ornamental trees are to dwellings, especially in towns and open parts of the country; but few attend to having them planted. The inhabitants are either tenants and "going away," or defer the matter year after year for lifetime. Tavern keepers are too insensible of the great advantage that a shade in front of their houses would be to them, or we should not see so many naked fronts. Any one who has travelled during the heat of summer knows the comfort of stopping at a tavern where his horse and himself can be refreshed under the cool shade of trees; and that he would rather travel miles than be subjected, whilst resting, to the burning rays of a meridian sun. A garden and a few ornamental trees, add twenty-five per cent to the value of any dwelling in the estimation of a person of taste; and both these are in the power of every one to command; and to procure which would be a healthy recreation.

The naked and exposed appearance, and the ab-

sence of all horticultural decorations about dwelling houses generally throughout the country, has frequently been remarked by travellers and strangers a national defect, and a glaring want of taste. It is said, "that he who can make two spears of grass grow where only one grew before, ought to be considered as a public benefactor;" and we may add he that will induce our countrymen to make gardens and plant trees, will be no less a benefactor; he will relieve us from a reproach, and raise the value of the country, not only in the estimation of all lovers of comfort and neatness, but also in price.—*Pennsylvania Gazette.*

The following remarks of MA PHINNEY and MR DAVIS, are in reply to the Queries proposed by MR LOWELL, and inserted in the *New England Farmer*, page 116 of the current volume:

To BENJ. GUILD, Esq.

The following reply to the inquiries of the Hon. Mr. Lowell, and others of the Agricultural Committee, relative to my orchard, is made by your very respectful and obedient servant,

ELIAS PHINNEY.

In 1822 I planted out 205 apple trees, in 1824, 150; and in 1825 and 1826, forty; making in all, 395, most of them in one enclosure. They consist of Baldwins, Roxbury Russets, and Rhode Island Greenings, with a few Porters. The distance each way between the trees, is about two rods. They were all grafted or budded in the nursery, the latter promise to be better trees than the former. I consider budding preferable to grafting. The wound occasioned by the process of budding heals sooner, and the trunk is more perfect. The ground upon which I planted my orchard was entirely new, having been ploughed, for the first time, in the fall of 1821. It had been for many years over-run with a large and thick growth of shrub oaks, and whortleberry bushes, and some small pitch pines. It was originally covered with a pretty heavy growth of oak and walnut trees, which had been cut off about thirty years before. From that time, till 1821, it had been used for a pasture, though a single cow could hardly have found support in the whole lot. The soil is generally a light, rich loam, upon a gravelly, and, in some parts, a ledgy bottom. The orchard is on the declivity of a hill, having a south and southeast exposure. Most of my trees were taken from the nursery in November, the roots placed in trenches, and covered with dirt until the following spring. This was done to avoid the necessity of setting them out before the ground had become warm and dry. If left in the nursery till spring they are seldom or never taken up until the sap has begun to flow. When removed after this takes place, the check occasioned by the removal, if not fatal to the tree, often injures its future growth. The best time to take up trees, is unquestionably, when the sap is least active. If taken up late in autumn, and the roots secured from the sun and air, they may be kept with perfect safety until the middle of May, and planted out at that time with proper care, and as near the surface as possible, vegetation commences almost instantaneously; they will not require to be supported by stakes, and will grow nearly as much the first, as in any future year.

I planted my trees as near the surface of the ground as possible. In some instances, where the

roots would admit of it, they were placed upon the surface, without digging any holes, and the dirt placed upon the roots—those set out in this way have invariably flourished the best, and have kept their erect position quite as well as those set deeper.

No stones or rubbish were placed at the roots of my trees when planted out. Every substance that would be likely to ferment was carefully avoided, as a slight degree of fermentation in any thing placed in contact with the roots, would be apt to destroy the small fibrous roots, or prevent their shooting; and thereby check the growth of the tree. The life of trees will be more certain, and their growth better promoted, by putting nothing at the roots, when first planted out, but the vegetable mould of a good virgin soil. The descending roots & those which crossed or interfered with others were cut off. The small fibrous roots were suffered to remain. These, however, when they have become dry, either from exposure to the sun or air, or from having been a long time out of the ground, should be taken off, for the obvious reason that others will not put out so soon when those, which are dead, are allowed to remain.

The land upon which my orchard is set, as I before stated, was ploughed for the first time, in the fall of 1821,—since that time, it has been in tillage; though so filled with roots and stones that little could be done by tillage for the two first years. It was sowed with barley the last spring, and about the first of September the stubble was turned in, and the land sowed down to grass, except a space of about six feet in diameter round each tree; which, as heretofore, is to be hoed and kept clear of weeds and grass. By keeping the surface of the earth about my trees loose and clear from weeds and grass, they have never apparently suffered the slightest check in their growth in the driest seasons. Late in the fall of each year, I have had put round the roots of my trees, a small quantity of compost, made of rotten lime, bones, and some coarse ashes. This manure after remaining about the roots for the winter, is mostly removed in the spring and thrown at a distance from the trees. The hoeing commences as soon as the weeds appear, and is continued as often as it is necessary to keep them down and the ground loose.

The subject of pruning is one next in importance to that of a good cultivation of the soil, in which trees are planted. I commence pruning as soon as the leaves put out after planting. By pruning trees when small, much labor is saved, and the injurious effects of late pruning are avoided. The wound occasioned is small and heals over very soon. I have invariably pruned my trees while the sap is flowing most freely, and the growth the most rapid, which is usually about the first of June; and in most cases covered the wound with a mixture of lime, and clay, with a portion of hair worked in, to prevent its cracking and falling off. By this method, the wound occasioned by taking off a branch, if not more than half an inch in diameter, heals completely over the first season. I take off all branches which at the time of pruning interfere, or seem likely, from their direction hereafter to interfere with others; and all such others as are required, in order to give the top an equal balance.

In the next place, I take off such branches, as seem likely when they shall have become large

to prevent a free admission of the sun and air to every part of the top. This I consider a very essential part of pruning, as every precaution should be taken while the tree is young and in vigorous growth, to avoid the necessity and the risk of removing large limbs when it shall have become old and feeble. This mode of pruning keeps the centre and all the parts of the top sufficiently open.

I have never scraped or split the bark of my trees. Soon after planting I noticed on a few of them, small insects adhering close to the bark.—I attempted to destroy them by an application of lime mixed with clay and some other substances, but without effect. I then applied a wash made by dissolving a pound of potash in four quarts of water, which has entirely destroyed the insects, and has kept the bark perfectly clear and smooth. I have applied this wash once a year,—generally about the middle of May.

My trees have not been visited by borers, nor any other insects, injuriously, except those above stated; nor with canker or black mould. The best remedy for insects, canker and all the evils and disorders, to which trees are subject, is, in my opinion, a healthy and vigorous growth, which may always be secured by careful planting, good tillage, and judicious pruning.

ELIAS PHINNEY.

Lexington, 12th Oct. 1827.

MIDDLESEX, ss. *October 12, 1827:* Then the aforesaid Elias Phinney made oath to the truth of the foregoing statement.

Before me, Wm. Gordon,
Justice of the Peace.

BENJ. GUILD, Esq.—In compliance with the request of the Hon Mr LOWELL, I make the following replies to you, respecting the general management of my apple orchard in this town.

1. I planted out from the nursery in April 1819, one hundred and twenty-five apple trees, and in the spring of 1823, about thirty more.

2. They consist of Baldwins, Greenings, Russets, and Spitzenburgh, about one quarter of each kind, excepting fifteen, which were imported from France.

3. They were purchased (excepting the above fifteen) of Mr John Kenrick of Newton, and Mr Enoch Baldwin, of Milton, and were budded or engrafted by them.

4. They were generally planted in land broken up for the first time, which had been a rough, stony pasture, and covered with small trees and bushes of various kinds, which had been offered for sale at twenty-five dollars the acre.

5. They were planted a little deeper than when growing in the nurseries, and the best soil was put at the bottom of the holes, and the holes dug large. The rows were planted forty feet, and the trees in the rows, fifty feet distance from each other.

6. The ground has been in grass for six years, but has always been kept open about the trees, by digging every year, and one year I planted potatoes around them.

7. They have been freely pruned every year in the month of May, and generally cut from the centre of the tree.

8. They have been manured every autumn, with a compost, consisting of bullocks' feet, bones, marine shells, tan yard and street manure; and the first year I had the piths of ox horns driven down about them.

9. After pruning in May, the body of the trees have been washed over with soft soap, and a little old slacked lime intermixed to make it adhere to the tree.

10. They have been infested by the borer, and great pains taken in cutting them out, after which the wounds have been plastered over with Forsyth's composition, and last year I washed them over with pot ash water.

11. They never have required scraping, the bark having always been kept clean and bright by the washing with soap.

Respectfully, I am, sir,

your obedient servant,

CHARLES DAVIS.

Roxbury, Oct. 1, 1827.

P. S. Since writing the above, I have thought proper to state that in 1822, the tops of many of the trees became so heavy that they began to grow crooked, and I had them staked and tied, with a piece of mat under each cord. Two years after it was discovered the borer was making havoc under the mats, and on examination found two or three trees had been quite destroyed, and some others considerably injured. The mats were immediately removed. C. D.

Suffolk, ss. Boston, Oct. 3, 1827.—Then the above named Charles Davis, Esq. personally appeared and made solemn oath to the truth of the above statement subscribed by him, B. GUILD.

DRESS OF CHILDREN.

Is there any reason, aside from fashion, why the dress of children should be so contrived as to leave naked their arms, shoulders, and upper part of the chest? If there is none in favor of this custom, there are reasons, and serious ones, too, against it.

That leaving these parts uncovered is uncomfortable to the individual, any one may be convinced by making the experiment upon himself. Let him leave his arms, and the upper part of his chest exposed to the variations of temperature during the waking hours of almost any one day; and if, on trial, his feelings compel him to restore to those parts their usual covering, let him have compassion enough on the children under his care to furnish them with a similar protection against the vicissitudes of the weather.

But the objection on the score of comfort is not the greatest one. This mode of dressing is also detrimental to health. The state of the lungs and other internal organs, greatly depends upon the state of the skin; and is in no way more often disordered, than by any cause which interrupts the due process of insensible perspiration in the latter. In tropical countries this fashion might be tolerated with impunity. But in ours, and especially in the New England States, where the temperature of the atmosphere sometimes varies fifteen or twenty degrees in the course of a few hours, it is entirely out of place. If such as have arrived to years of discretion will hazard their lives by conforming to the absurdities of fashion, the worst is their own; but to impose this kind of penance upon young children, merely to gratify the pride of their parents, is cruel,—is inexcusable.—*Con. Journal.*

A few nights ago, says a New-York paper, 2535 eels were caught at one haul at Owego, averaging from one to five pounds each—more than 3000 pounds.

GYMNASTICS.

The following account of a swimming school at Amberg, in Bavaria, we find in the New-York Statesman, taken from the papers of that country, which give splendid accounts of the success of some of the scholars.

The soldiers of a regiment of infantry were enabled to go down 24 feet under water, and swam about from an hour to an hour and a half. They jumped from an elevation of 39 feet, with their uniform on; and bore at the same time the weight of 30 pounds. They found and took from the bottom of the river, guns, muskets, &c. which had been lost there a long time before. Another experiment was made at Passau. The best swimmers separated into three parties, and swam for a long time without touching the earth. The first party had in their centre a musician who played on the clarinet. Before them on a table was placed wine, and the swimmers drank to the health of the Colonel who was on the bridge. The second party composed of officers, had before them a table covered with refreshments; the third also ranged themselves round the table. It is represented as a curious spectacle to see men eating and drinking and amusing themselves in the middle of a stream on tables the water bore up.

SEEDS.

It is a very general impression among gardeners, that several species of garden seeds cannot be raised in America *in perfection*; among these are the invaluable species of *battersea*, early York, and early sugar-loaf cabbage. English seeds must, therefore, be imported at an expense of 4 or 5 dollars the pound, to set our crops annually.—*This is an error.* Experience has taught me that these seeds can be raised in as great perfection in our country as in England. These species of cabbage are generally sown very early, in hot-beds, for early use, and come into perfection and full head early in July, and consequently the crop is exhausted before fall, and none left to propagate the species. To obviate this, I have reserved a few seeds, sowed them early in June, and set the plants late; by which means I have had a good supply of heads in the fall. This late crop is as easily preserved as any other species of cabbage, and, if so preserved, and set in the spring, will yield a plentiful supply of seed. During the war, I resorted to this expedient, and for five years past have had complete success. Some precaution is, however, necessary in setting these peculiar species; they should be carefully separated, and set at a distance from other species; otherwise they will degenerate and intermix with the other kinds, and produce a mongrel species. So careful are the English gardeners to prevent this mixture of sorts, that nets are thrown over each kind when in blossom, to prevent the bees from carrying the farina of one kind to another, to mix and spoil the varieties. The same precautions, I have no hesitation in saying, will produce any one species of cabbage seed in as great perfection in this country as in England or France.—*Albany Plough boy.*

ONIONS.

The practice recommended in the 2d volume of the Memoirs of the Agricultural Society of raising onions, by sowing the seed in the month of August, has been so fully tested near Philadelphia, that every farmer ought to adopt it. To continue the old practise is absurd when they may obtain

equally good crops by adopting the new mode, and have the use of the ground upon which they are sown from March until August, and considering that the labour attending the new mode is much less than that necessary in the old. Onions have even been raised by the writer of this, as large as the common onion, by sowing white Portugal onion seed early in the spring in good ground, thin, and keeping them clear of weeds. The Portugal onions grow very large, and are remarkably mild and of a pleasant flavour. But whether the seeds be native or imported, they should always be sown in drills, on account of the great ease with which they are kept clean. The same rule ought to be observed with respect to all GARDEN VEGETABLES. The practice is now commonly followed by those who make it a business to attend the Philadelphia Market with vegetables. The neatness and beauty of a garden is also thereby greatly promoted; a consideration that ought not to be overlooked, for it is one that will serve to stimulate to greater industry in attending to it.

ORCHARDS.

We recommend to especial notice the remarks of the Hon. Mr. LOWELL on our first and second pages, relating to the subject, delivered before the Massachusetts Agricultural Society at its recent exhibition at Brighton. They *demonstrate* what many farmers already know, and what more we trust, will know, by experiment, that fruit trees may be cultivated so as to become more productive and profitable than most other products of the farm in a few years. It is doubtless in some part owing to the circumstance that they do not bring to the cultivator immediate profit that we see so few thrifty orchards. The annual income for the labor bestowed upon them must, it is true, be dispensed with for the few first years; but taking ten years collectively, and labor can in no way probably be so profitably employed upon land as in the production of fruit trees. It is also to be taken into the account, and reckoned among the inducements to the cultivation of fruit trees, that they lessen scarcely at all, the other products of the soil. Nearly as much grain or grass will be produced on lands covered with orchards as without them.

It is a common error, too, that a peculiarity of soil is necessary to the production of fruit trees. We have seen them thrive on almost every variety of soil; and on steep acclivities as well as level land. Nearly all that is required, we are told, by cultivators, is that the earth about the roots be kept loose by light manures; or, if the soil is strong, by other light substances. As a matter of profit as well as gratification in the production of rich and valuable fruit, we repeat the belief, that labor can scarcely in any way be so advantageously employed. Undoubtedly a far greater number of orchards have been planted in this neighborhood as well as in other parts of N. England within the last five or six years than in any equal number of years before. Still, more may and should be done in this way for individual us well as the public benefit.—*Taunton Reporter.*

Hay press.—M. B. Bliss of Pittstown, Maine, has for sale a new constructed Hay Press, built on wheels, and transportable. If it can be offered sufficiently cheap, it must possess very great advantages over a standing press.

[From the Christian Spectator.]

FRUIT A SUBSTITUTE FOR ARDENT SPIRITS.

In lately reading in the New Edinburgh Encyclopedia, Vol. X. article Horticulture, my attention was arrested by the following remark: "It is a just observation of an eminent horticulturist, (Mr. Knight) that the palate which relishes fruit is seldom pleased with strong fermented liquors, and that as feeble causes, continually acting, ultimately produce extensive effects, the supplying the public with fruits at a cheap rate, would have a tendency to operate favorably both on the physical and moral health of the people."

Upon comparing the observation here made, with the habits of various persons with whom I have been acquainted, I was led to conclude that it was founded in truth.

Viewing the subject to be one of some importance, I then endeavored to ascertain whether the fact alleged received any support from the known habits of different nations. In the northern countries of Europe the finer fruits, if raised at all, are raised only in small quantities. Even in England, cherries and peaches, and pears, and apples, fitted for the table, are seldom brought to perfection without the aid of walls, and coverings, and artificial heat; and in cold seasons, even apples of the hardier kinds do not ripen in the open fields. But in England, and in all the other northern countries of Europe, the intemperate use of strong fermented liquors prevails every where to a very great extent. On the other hand, in France, and Spain, and Italy, and the other countries in the south of Europe, where most of the fruits above mentioned are raised with ease and in the highest perfection; and where in addition to these they have an abundance of the most delicious grapes and figs; and in many places, olives and oranges; together with many other fruits peculiar to warm climates, drunkenness among all classes of society is almost wholly unknown. It is worthy of remark also, that savage and uncivilized nations, who have seldom any fruit except such as grows wild, are almost universally greedy after ardent spirits.

The diversity which prevails in Europe with respect to the use of ardent spirits has sometimes been resolved into the influence of climate. In cold regions it is thought there is naturally a much stronger propensity for ardent spirits, than in regions where the climate is more mild and uniform. But this opinion is wholly unsupported; nay it is contrary to well established facts. In Nubia, lying within the torrid zone, there is a universal prevalence of intoxication; uncivilized nations possess the same propensity for intoxicating liquors in warm, as in cold regions; and in our own country as free use is made of ardent spirits at the south, as at the north.

The cause of the temperance which prevails in the south of Europe, it is believed, will be found in the use of fruits; which are very abundant in those countries where the vine flourishes. But the tendency of wine to create an intemperate appetite is comparatively so small, the quantity of weak and therefore harmless wine made and consumed in countries producing the vine is so great, and so excellent is the fruit itself, that the vine may doubtless with propriety be cultivated for the purpose of checking intemperance.

In the United States of America, though well

fitted for the production of fruit, throughout nearly their whole extent, drunkenness is every where very common. This may perhaps be considered an anomaly. But it admits, I think, of a satisfactory explanation. The original settlers of this country were principally from the British Isles; and brought with them a taste for fermented liquors which they had contracted in their native land. For a long period, they were of necessity wholly destitute of fruit, with the exception of a few inferior kinds which grew wild. And even to this day the more delicious fruits—such I mean as are suited to the climate, are by no means extensively raised. On probably nine tenths of the farms in the State in which I reside, which is one of the oldest, there is little fruit of any value, with the exception of apples, and these often not grafted. Peaches were formerly common, but now they are very rare—though with a little pains easily raised in any quantity. English cherries, with the exception of a few places, are by no means abundant, often none in a whole township. Good pears, in any considerable variety, are seldom seen. And strawberries, raspberries, and gooseberries, are cultivated only in a small number of gardens. Here and there an individual is attentive to the raising of fruit. Though but few families, probably not more than one in five hundred, are well supplied the year round, with the various fruits suited to the season. Hitherto, therefore, in the country, the use of fruit can have had but a partial influence in promoting temperance. In confirmation of the origin of intemperance in this country as above explained, it may be stated, that in Cuba, settled by the Spaniards, a people distinguished for their temperate habits, as was lately asserted in the New York Advertiser, "there are no drunkards!"

The manner in which fruit is made to supply the place of fermented liquors is easily explained, and the statement, it is believed, will correspond with what most persons have experienced, or observed. In the intervals of our regularly established meals, we all occasionally, and very many of us constantly, either feel, or fancy that we feel, the need of some slight refreshment. At such times, if fruit is not to be had, many persons resort to fermented liquors, and thus insensibly lay a foundation for intemperance. But if they are in possession of delicious fruits, these are almost always chosen by temperate people in preference to the choicest wines. This need of refreshment is more especially felt in summer, consequent upon the exhaustion occasioned by heat and fatigue. Fruit is then found to answer the double purpose of quenching thirst, and recruiting exhausted animal nature, and in the most perfect manner. It is in the highest degree—I refer only to the case of temperate persons—grateful to the palate—refreshing to the system—and salutary in its remote and grateful effects. The man, indeed, whose appetite is not satisfied with delicious fruits alone, already possesses a dangerous fondness for spiritous liquors. It may be thought by some, that the laboring classes of the community would set but little value upon the substitute here proposed for ardent spirits. Whether they would or not, it is certain that the use which they make of ardent spirits is detrimental. But what reason can be assigned why they should value fruit less than other men? They have the same appetite; and fruit is equally refreshing to them. The reformation of drunken laborers, by the substitution

of fruit for ardent spirits, is certainly not expected; nor indeed the reformation of any other class of drunkards. But in those cases where the natural taste has not been vitiated by the use of ardent spirits, it is believed that fruit would be chosen by laborers invariably, in preference to ardent spirits, allowing at the same time, that they were properly aware of the danger of intemperance. Nothing certainly can be conceived of, more suited to the wants of a laborer, toiling in the dust or sun, athirst and weary, than a plate of strawberries, a melon, or a basket of cherries, or peaches, or apples. With these and other fruits, which might easily be raised in sufficient abundance, together with such simple drinks as common beer, milk, and molasses and water; and cider when desired, the laboring classes of the community would undoubtedly be able to perform the greatest quantity of work, with the highest health and in the best spirits.

The expense of cultivating fruit is much less than is generally supposed. In the court yards and gardens connected with most houses, there is ground sufficient, and ground usually uncultivated, for raising in abundance every variety of fruit suited to the climate, with the single exception of apples. The original expense of procuring the trees is trifling; and even this may soon be wholly saved by a little pains in raising them.

The importance of providing substitutes for ardent spirits has frequently occurred to the benevolent, and various substitutes have been suggested. In recommending fruit for this purpose, it is not designed to have it take the place of other suitable substitutes; but to have it introduced into their number, with that rank and importance in the scale to which its just claims may entitle it.

FARMING IN ALABAMA.

Extract of a letter from the interior of Alabama, to the Editor of the Vermont Chronicle.

Northern Farmers might prosper here without much aid from slave labor. The price of the government land is a dollar and a quarter an acre, and the best improved lands are purchased for ten dollars. The great object of farmers here being their cotton crops, they have hitherto paid comparatively little attention to the ordinary comforts of life. The stock are without pasturage, and are suffered to run at large in the range, as it is called, or the woods, and the cows are milked only when they may be allured to the pens by the calves. Of course, cheese is not made, and but little butter. Still this is naturally a fine country for stock; and even as they are managed, or rather without any management at all, they grow to a larger size than any I have ever seen. They literally occasion no expense, as it is unnecessary to lay up in the summer their support for the winter; for there is no month in the year when they do not find grass and herbage enough for subsistence. A New-England farmer, indeed, would manage differently here; for by taking a little pains, he might find his account in furnishing for the market the best of beef, butter and cheese, and this without intruding upon his staple crop. What is another neglected item here. It is but two years since cotton fell to its present low price, (about 8 cents) and although the soil is said to be well adapted to this grain, the farmers have not yet fallen into the practice of raising it, while they give from 6 to 8 dollars a barrel for flour. There is no doubt that the extensive and extremely fertile cer-

on lands here would produce the cane to any extent, while the uplands have proved well adapted to the culture of the vine.

This State indeed is new. The virgin forests of Alabama, in her greater extent, still hold in silent majesty the empire that nature has given them, with no tenants but her own. The deer, the bear, and the panther, roving at large, or contesting their ancient rights with newer claimants, have not long learned to startle at the footsteps of man, and to dread the power of intelligence and art. As these wilds gradually yield to another, as Alabama swells in population, and her future institutions, under the care of the wise and virtuous of her sons, shall become the fruitful dispenser of science and pure principles, she must become, with a single exception (Slavery) one of the most favoured members of the confederacy.

From Flint's Western Monthly Review.

FARMING.

If one half the zeal, energy, and expense, that blots so many gazettes with low and coarse abuse, setting the community by the ears, for the sole gain, and the paltry purposes of a few demagogues and office-seekers, were bestowed upon the advancement of agriculture; if the people were half as ambitious to improve and beautify their fields, as they are to settle the nation; and half as angry with thistles, thorns and poor fences, as they are with their political opponents, who, probably, wish just as well to the country, as themselves—we should have more productive fields, less complaints of poverty, more ability to be charitable and munificent, and abundantly more good feeling. From Pittsburg to New-Orleans the son ploughs as his father did before him, and the great mass of farmers are as stationary in theory, as they are in practice. Nine in ten of them believe, at this moment, that book-farming is the more, useless, visionary dreaming of men that know nothing about practical agriculture.

We would tell them that England is the garden of Europe, simply because almost every acre of the ground is cultivated scientifically, and on principles, which have been brought to the test of the most rigid and exact experiment. We would tell them, that N. England, of whose soil and climate they are accustomed to think, as consigned by Providence to sterility and inclemency, is the garden of the United States, only because the industrious and calculating people do not throw away their efforts in the exertion of mere brute strength—but bring mind, and plan, and system, and experience, to bear upon their naturally hard and thankless soil. On every side the passing traveller sees verdure, and grass and orchards, in the small and frequent enclosures of imperishable rock, and remarks fertility won from the opposition of the elements and nature. After an absence of ten years, on our return to that country, we were struck with this proud and noble triumph, conspicuous over the whole region.

The real benefactors of mankind, as St Pierre so beautifully said, are those, who cause two blades of wheat to mature where only one did before. The fields—the fields, ought to be the morning and the evening theme of Americans, that love their country. To fertilize, improve and beautify his fields, ought to be the prime temporal object of every owner of the substantial soil. All national aggrandizement, power, and wealth, may be traced to agriculture, as its ultimate source. Com-

merce and manufactures are only subordinate results of this main spring. We consider agriculture, as every way subsidiary, not only to abundance, industry, comfort and health, but to good morals, and ultimately even to religion. We shall always say and sing "Speed the plough." We shall always regard the American farmer, stripped to his employment, and tilling his grounds, as belonging to the first order of nobility among us. We shall always wish him bountiful harvests, good beer, the moderate use of cider, and, if he will rear it himself, of the generous juice of the grape; but none of the pernicious gladness of whiskey; and we shall inly invoke upon his labors the blessing of God, and say of him, 'peace be within thy walls.'

STOCKBRIDGE AGRICULTURAL SOCIETY.

The fourth Anniversary of this Society took place on the 2d ult.

It gave to the Society a pleasing proof of its increasing usefulness, and an extension of its beneficial effects, far beyond the expectations of its earliest friends.

The Society has now existed long enough to show, that it has done, and is working great good to all interested in it. Almost every thing exhibited for premium, or show, was superior to that of last year; and we are happy to add, that it is gaining interest with the public in proportion, as it is becoming more useful. Though the day was very unpropitious, the collection was much larger than on any preceding anniversary.

The ploughing match was far better than that of any former year, though it commenced just at the termination of a violent rain. Seven fine teams ploughed, and the difference in the quality of the ploughing was scarcely perceptible.

After the ploughing, the people returned to the village, and viewed the animals, entered for exhibition, and the domestic manufactures. We have never seen so fine a show of animals; we understand that a yoke of working cattle exhibited, have since been sold for \$140—one year-olds for \$50. Seventy five dollars were offered for a last spring calf which was refused.—These are facts sufficient to induce every farmer to spare no pains to procure the best breed of cattle.

The Domestic Manufactures were such, as justly to gratify the pride of every friend of improvement. They displayed great taste in the arrangement, and choice of colors, were remarkable for the fineness and firmness of their texture, and much exceeded in amount, and variety, the exhibitions of any preceding occasion. It is a matter of great congratulation, that our enterprising, intelligent and industrious females are giving so much of their time and attention to this branch of industry. They are doing much, not only for themselves, but much to introduce a wholesome spirit of economy in the expenses of living.

At one o'clock an excellent dinner was prepared at Mrs Hicks', at which were about 150 guests.

Mr Mark Hopkins delivered an excellent and very appropriate Address, which was much applauded for the valuable instruction it contained, its pure morality and the heartfelt interest expressed in the real respectability and happiness of Agriculturists.—*Berkshire Star.*

Cheap enough.—Good beef steak may be bought in our market at a cent and a half per pound.

{Foye's (Missouri) pap.

CATTLE SHOW IN NEW-BRUNSWICK.

On Thursday last, pursuant to notice, the Annual Cattle Show for this City and County took place at the Block House. The Animals lately imported from England were exhibited for the inspection of the public, and the best judges upon the ground pronounced themselves to be highly pleased with the appearance of the Cattle in all points, and considered them to be a valuable acquisition to the Country.

Some persons expressed their surprise that so few creatures were brought forward for premiums; this has grown out of the following circumstances:—By a regulation of the Board of Directors, such Cattle as had once obtained a premium, were ever afterwards ineligible for competition. All likewise under a certain age were inadmissible, and others were kept back by their owners, because they could not state with perfect precision, the exact quantity of food consumed by them. When, however, the state of the Country is taken into consideration, we shall cease to be surprised that so few were competitors. Our attempts at improvement and exhibition are but of recent date, and there is not yet such a sufficient number of the improved stock, as will furnish a regular and full supply above a certain age, from year to year. This no doubt will soon be obviated. Several very fine young Cattle were produced on the present occasion, not for premiums, but to show what is in progress. And as the Board of Directors become more fully acquainted with the actual state of Cattle in the Country, their regulations will no doubt be so framed, as to open the widest possible field for competition, consistent with the promotion of the ultimate design.

After the business of the Cattle Show was concluded, and the premiums awarded, the Annual Meeting was held at the Coffee House, and the Report of the last year's proceedings was read, and was received with marked approbation.

His Excellency Sir Howard Douglas, the Patron of the Institution, presided, and a number of respectable gentlemen, besides the Directors, were present. It was to us a most pleasing and gratifying sight, to see such an assemblage of gentlemen of the first respectability and intelligence, with His Majesty's Representative at their head, evincing the most lively interest in our Agricultural concerns, and labouring to devise means by which they may be most effectually promoted.

We should by no means be discouraged by small appearances at the beginning; let us labour to improve our system, and then steadiness and perseverance will bring us to a favorable result.

{St John's (N. B.) Gazette.

FARMING MATTERS.

Last year, the crop of hay in Berkshire, was much shortened by the drought, and the farmers disposed of their cattle at almost any price, in order to reduce their numbers in proportion to the means of wintering them. Some went still further, either from an over apprehension of starving their cattle, or else that they might have hay to sell, which, being nearly a hundred per cent. above the ordinary price, held out a prospect of considerable gain. But this in some cases was not realized, because too high a price was asked, or else there was really more hay on hand, after all the fears, than the markets required, and consequently considerable was soummered over. The present season has been exceedingly favorable to the crop

of hay, and cattle being scarce, for the reasons above mentioned, their price is now from 50 to 75 per cent. higher than it was last year, and farmers, who were so anxious to dispose of them a year ago, would now be glad to buy them back again.

From these circumstances the farmer may learn the following lesson: 1st. Not to give away his cattle when hay is scarce, if there is a possibility of wintering them. 2d. Whenever the crop of hay is likely to fall short, (which may be determined in the month of June) to secure a sufficiency of food for his stock, by sowing Indian corn, oats or millet which may be mown and converted into the most valuable fodder.—*Berkshire American.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, NOV. 9, 1827.

FALL PLOUGHING, LIME, &c.

Land which is composed in part of clay, or is what is called a stiff soil should be ploughed in the fall, and laid as light as possible, so as to expose it to the action of the frost, which will greatly assist in subduing it. Fall ploughing too will destroy grubs, and other insects, by exposing them to the winter's severity. The fall of the year is likewise a proper season for the application of quick lime to your ploughed fields. With regard to the best mode of applying lime, its quantity, &c. we can give no better directions than are contained in an article, published in the Memoirs of the New York Board of Agriculture, vol. iii. page 124, communicated by Daniel Buckley, Esq. of Salisbury, Pa. from which the following is extracted:

"The method of applying lime, which I have adopted in common with my neighbors, is, in the first place, to plough up a sod field with a strong team, in the spring or fall.—harrow it the way it is ploughed, and mark the field into as many squares as you intend to put on half bushels, say 100 on the acre, which will bring the furrows about 20 feet apart each way, and require 50 bushels to the acre. This quantity I have found to be most profitable. When the lime is burnt, and as soon as it is cool enough to handle, it ought to be hauled on the land already marked, and a half bushel deposited in the centre of each square, in as compact a heap as possible. If water is convenient, I prefer to slack the lime immediately, rather than to wait for rain, as it becomes finer and can be more easily spread. As soon as it has slacked it is immediately spread and well harrowed. This method I prefer for Indian corn, barley, oats, rye and potatoes. On all the above crops I have experienced a great benefit from lime the first year after its application. With potatoes, I add about 15 two-horse loads of barn yard manure to the acre, before planting. A second liming is often given, and much approved of, after an interval of three or more years. This amalgamates better, and can be more intimately mixed with the soil.

"There are good farmers who differ as to the quantity of lime that is most profitably applied.—Some say 60 bushels on the acre, some 70, and some more. I have applied 100 on an acre of fine stone land, at a dressing; but have not been able to discover any benefit from using it thus freely, nor any injury, except in the loss of lime."

It is observed in "Letters of Agricola" that

the application of lime is matter neither of mystery nor of deep philosophical research. If the necessary quantity be given to land, and properly mixed with the soil, it is a thing of much less moment than we are apt to imagine, whether it be applied in its caustic or mild state, and for this reason that there is a natural progression from one to the other."

London remarks that "In the application of lime to arable land there are some general rules commonly attended to by diligent farmers, which we will give nearly in the words of a recent publication.

1. As the effects of lime greatly depend on its intimate mixture with the surface soil, it is essential to have it in a powdery state at the time it is applied.

2. Lime having a tendency to sink in the soil, it should be ploughed in with a shallow furrow.

3. Lime may either be applied to grass land, or to land in preparation for green crops or summer fallow, with almost equal advantage; but in general the latter mode of application is to be preferred.

4. Lime ought not to be applied a second time to moorish soils, unless mixed up as a compost, after which the land should be immediately laid down to grass.

5. Upon fresh [or new] land, the effect of lime is much superior to that of dung. The ground, likewise, more especially if it is of a strong nature, is more easily wrought; in some instances it is said that the saving of labour would be sufficient to induce a farmer to lime his land, were no greater benefit derived from the application, than the opportunity thereby gained of working it in a more perfect manner."—*General Report of Scotland.*

Advantages of lime.—Though there are exceptions to the rule, yet, in general, it may be confidently asserted, that unless where a soil has by nature enough of calcareous matter in its composition, for the purposes of vegetation, it can neither be brought into its most fertile state, nor will other manures be so useful as they ought, if lime, or some other calcareous earth, be not previously applied. The utility of lime to turnips is so great, that though in the same field, where no lime had been applied, the crop died away; yet in the limed part the turnips flourished with unabated vigour.

[Code of Agriculture.

Dr Cooper, in the last Philadelphia edition of Willich's Domestic Encyclopedia says, "Oyster shells are frequently burnt into lime, to lay upon land. They are a better manure when ground without burning, owing to the remains of animal matter in them. A good lime compost is the following: spread on any platform under cover, 6 inches of mould, then 3 inches of well burnt lime, slack it with water in which common salt has been dissolved at the rate of 1½ lbs. of salt to each bushel of lime; cover it with 6 inches more of mould. Before laying it on the land turn and mix this compost heap, and lay 300 bushels of it for each acre."

GARDENS.

The neglect of gardens among the farmers of the United States generally, is a common remark among all observing foreigners who visit us. In England, Scotland and France every cultivator, whether of his own estate, or of rented land, prides himself in the possession of a neat paled garden, which he renders not only useful to his

family, but highly ornamental. Every member of a household might take a part in the lighter cultivation of such a spot, and the exercise, while it added to their bodily vigor, would afford them great satisfaction. The laborious parts of the work, in the spring, being done by the male parts of the family, the keeping the plants free from weeds should be attended to by the females. The few gardens that are seen among our farmers are miserably overrun with weeds, which are permitted to increase, until their removal becomes so serious a job as to appal every one; and hence it is often difficult to find a beet, parsnip, or carrot among the weeds. Whereas, if a few minutes only were regularly bestowed by some one of the family every day, as the season progresses, the weeds would be kept under, and the vegetables would be increased in size and flavor by the operation of the sun and air.

PAINTS.

Earthy paints are more durable when exposed to the air than the metallic paints. White lead, in particular, by a small mixture of yellow ochre, produces a more pleasing as well as a lasting colour than white lead alone, which decomposes in a year or two, in the air. The colour it assumes is a cream colour, and has a full and rich appearance. It has been very extensively tried with success in Philadelphia.

NOXIOUS VAPOUR EXPELLED FROM WELLS.

Before any person is sent down into an old well to repair it or get anything out which may have fallen in, let a candle be let down. If it burns clear he may safely go down; if it goes out it is a sign that it contains foul air, which will destroy life. In this case take a hoop, rather smaller than the well, attach to it round the rim of the hoop, a strong bag or cloth, and tie the bottom together. Then by three strings to equivoise the hoop, suspend it to one long rope, and let it down. Raise it suddenly and it will bring up the bad air, which is much heavier than common air. Do this twice or three times, and in two or three minutes all the bad air may be brought out. Try it with the candle, and if that burns, the person may safely go down.

This experiment, which was suggested by Robert Patterson, Esq. of Philadelphia, has been repeatedly tried with success.

TAINTED BEEF RESTORED.

A writer in the New York Evening Post, says "In the last fall I procured an acquaintance of mine in the country to put up a barrel of fat beef for my family's use during the winter. The barrel of beef was sent me agreeably to contract; but before I had used one quarter part of it, I observed it tainted, and so much as to smell quite offensively. The beef being very fat and fine, I was loth to throw it away, I made the following experiment: I procured a half bushel of charcoal, and after taking out the beef, and throwing away the offensive pickle, I repacked it in the barrel, laying the pieces of charcoal between the pieces, and making a new pickle, and adding a little salt petre. I covered the beef, and in about six days found it as sweet and good as it was when first put up."

BOSTON POULTRY MARKET.

Our market has been well supplied, lately, with the greatest variety of wild fowl, and fine poultry, so as to suit the taste of any epicure; comprising

canvas back ducks, red heads, brants, black ducks; blue bills, whitebills ducks, teal, woodcock, snipe and various other kinds of birds; wild goose, murrelet goose—and all kinds of poultry—and some fine venison.

AGRICULTURAL EXTRAS.

Mr WILLIAM STONE, the intelligent and able superintendent of the city farm, connected with the House of Industry at South Boston, has left at the office of the New England Farmer, several fine roots of the Mangel Wurtzel Beet, weighing 18, 19 and 20 lbs. each.

Still larger.—Mr NATHAN TUFTS 2d of Charlestown has left with us, for public inspection, several roots of Mangel Wurtzel, the largest of which weighs 204 lbs.—Six of these weigh collectively 99½ lbs.—We hope that both Mr Stone and Mr Tufts will give us some account of their mode of managing their crops, and the amount raised per acre.

Mr Joseph Parker of Wilton, N. H. has raised this season, one of the old fashioned Crook Neck Squashes weighing 3½ lbs.

Potatoes.—J. Locke Esq. of Andover, raised this season from one seed potato one bushel and a half, in number 225, of excellent potatoes; 39 of which weighed 29½ pounds. Total weight 8½ lbs.

On the farm of Mr Timothy W. Dexter, in Cumberland, R. I. were raised the present season, from one potato five pecks, lacking one quart, weighing 85½ lbs.

Mr James Estabrook, of South Reading, from 25 hills of potatoes obtained 4 bushels and ½ peck; 8 of those hills produced 2 bushels. They were of the kind called long reds. The potatoes were planted in the common way, with hills of the usual size, and without any intention to note their product; and it is not known to us whether they were put in the ground whole, or cut, nor the quantity of seed made use of.

Large Radish.—A radish was raised the present season, in the garden of Dr. Noah Whitman, of West Bridgewater, weighing *nineteen* pounds! Its length was twenty-four inches and its circumference, (half way from the bottom) was twenty-two and a half inches.—*Colum. Rep.*

Price of Wheat in Ohio.—In the Mansfield Gazette, printed in Richland County, (Ohio), we observe an advertisement, offering *thirty-one and a quarter cents, in cash, or thirty seven and a half, in salt or dry goods, per bushel, for WHEAT.* If the farmers can afford to raise wheat at that price, their county is very appropriately named *Richland*.—*Bull. Pat.*

A certain preventive of birds taking seeds out of the ground in gardens &c.—“Mix together one pound of tar gas, quarter of a pound of brown spirits of tar, and a quarter of a pound of grease; into this dip some shoe-maker's thread or twine, and draw it several times over the newly sown beds, supported a few inches from the earth on the top of sticks.” *Robert Gordon, Chemist Druggist, Waterhampton, April 11, 1827.*

The Aurora Borealis, which was remarkable in our hemisphere, for several nights, the last of August, was noticed in England about the same time, and described as uncommonly extensive and bright in its appearance.

[From the New England Medical Review and Journal.]

A cure for the Asthma, by Dr. Francesco Chiarento.—This gentleman having observed that no means would relieve those who were affected with asthma so promptly as a free current of wind, he imagined that distending the lungs with air by means of bellows would produce the same salutary effect. He, therefore, being himself afflicted with this disease, introduced the nose of the bellows into his mouth, and having compressed his nose, he blew with considerable force, and for a considerable time, a large quantity of atmospheric air into his lungs. The operation was completely successful, and that with the aid of this simple instrument he could overcome in a few minutes the most violent attacks of the asthma. After having performed this experiment on himself a number of times, he then performed it on others, and with the same success. From the numerous experiments which he has performed, and from the many observations which he has made of their results, Dr. Chiarento does not hesitate to say that he regards the blowing of air into the lungs, as a means, not only capable of relieving with great promptness the attacks of asthma, but also radically curing this disease, when it is not the effect of great organic alteration.—*Antol. di Firenze, September, 1825.*

Apples a year old.—We were presented last week with a sample of apples, of the growth of 1823, which had been kept to this time in a sound state, by Mr Nathan Warner of Woodbury. His method of preserving them is very simple, and one that may be easily practised. The apples are to be laid down in dry flax seed chaff, where they remain until some time in the month of June following, when they are to be overhauled, those that are unsound thrown aside, the chaff spread out and dried, and the sound apples packed down again along with the chaff as at first. Managed in this way Mr Warner has had plenty of fresh apples through the whole of the past season and until the ripening of the same fruit this autumn.

[New Hampshire Journal.]

500 Grape Vines,

For sale in Charlestown, by Samuel L. Johnson. The above choice vines are of the *Straw water* species, all raised from cuttings, and are from 3 to 4 years old, most of them in a bearing state. Orders for the above may be supplied at J. R. Newell's Agricultural Establishment, No. 52 North Market street, or by the subscriber in Charlestown; price for each vine is from twenty-five to fifty cents, according to its age and size; all the above vines have been trained to trellises and insured to be as healthy vines as can be presented for sale. SAMUEL R. JOHNSON.

Subscription.—Select Table Grapes.

MR. ANDREW PARMENTIER, Proprietor of the Horticultural Botanic Garden at Brooklyn, two miles from the City of New York, offers to the public, by subscription, one dozen of the most select and choice GRAPES, for the table, many of which are in a bearing state, and can be seen at his establishment with the fruit, after only fifteen months planting.

Names of the twelve sorts.

No. 1. White Chasselas.—2. Chasselas of Fontainebleau.—3. Yellow Chasselas of Thonery.—4. Golden Chasselas.—5. Musk Chasselas.—6. Royal Chasselas.—7. Large Marces.—8. White Muscat.—9. Violet Muscat.—10. Black Muscat.—11. Grey Muscat.—12. Large Frankenthal.

The Subscribers will receive their Vines between the 15th of Oct. and 1st of Dec. and the 1st of April and 15th of May 1828, free of freight or postage to New York, well packed in boxes in such a manner as to go several hundred miles farther than New York.—Mr. Charles Swan, Grocer and Tea Store, No. 357 Broadway, and Messrs. Grant Thorburn & Son, Liberty-St. New York, are empowered to receive the subscription.—Price six dollars per dozen, and the plants to be paid for when delivered.—The subscription receipt will be accompanied by directions on the best mode of cultivating and planting the vine. The same sorts of Vines may be had separately.—Price 75 cents, with package, except the Golden Chasselas and Royal Chasselas.—Mr. P. will designate the different kinds of most congenial to each soil and situation for to make vineyards, and

arrange the roots at 25 cents each. Mr. P. warrants his vines to grow, and will replace those the spring or the fall after the plantation, that is not growing; provided, the person has followed his directions. References for the above assertion, to Dr. Vanderwey, (Col. Gibbs, Messrs. Wm. Page, Rufel R. Schoenck, Vanderwey, John Linn, and all the gentlemen who have bought their vines of him.—The fall is the best time to plant the vines in a sand or light soil, which is the best for the vines. Orders can be directed to Mr. P.'s establishment, post paid.—Mr. Swan will deliver gratis, the Provisional Catalogue of Fruit and Ornamental Trees of Mr. P. which may be had of his agents at Boston, Mr. Russell, New England Farmer office—Hartford, Mr. E. W. Holt—Baltimore, Mr. L. Lutter—Tucker & Co.—Buffalo, Mr. Lewis T. Allen—Baltimore, Mr. Hemingway.—*Brooklyn, Sept. 29, 1827.*

Grass Seeds, &c.

For sale at the office of the New England Farmer, No. 52 North Market Street, Boston, a large variety of *Grass Seeds*, comprising LUCERNE, FOWL MEADOW, ORCHARD GRASS, HERB'S GRASS, RED TOP, RED and WHITE HONEY-SUCKLE CLOVER &c. with the largest assortment of *Garden and Field Seeds*, to be found in New England.

Also 20 bushels fresh Canary Seed; genuine *English Rape Seed*; Hemp Seed, &c. for birds.

New England Farmer's Almanack, for 1828.—Just published at the New England Farmer Office, and for sale by BOWLES & DEXTER, 72 Washington Street, and at the Booksellers generally, the *New England Farmer's Almanack* for 1828. By Thomas G. Fessenden, Editor of the New England Farmer.

This day published by Richardson & Lord, at their town and country bookstore, the *Old Farmer's Almanack* for 1828, by R. B. Thomas, Esq. containing the usual quantity of news, useful, and entertaining matter, together with the sun's declination, and planetary positions, supplied by R. & L. at the lowest rate. In the press and will soon be published, the *Miniature or Pocket Almanack*, likewise the *Massachusetts Register* for 1828.

Goosberry Bushes.

Persons in want of superior varieties of Goosberries, can procure the bushes, by sending their orders to the office of the New England Farmer. They are from Glasgow in Scotland; the fruit is fine flavored and large, (some may be seen at this office measuring 3 and 4 inches in circumference) and of white, red, and yellow colour. The price will not exceed \$1 per bushel.

Superb Bulbous Flower Roots.

Just received at the office of the New England Farmer, direct from the most eminent florists in Holland, a large assortment of bulbous flower roots, comprising the finest varieties of

- Double white hyacinths, with purple eye
- “ pure white hyacinths
- “ red diademe de Flora
- “ dark blue hyacinths
- “ yellow rose tulips
- “ porcelain blue hyacinths
- “ early clarendon tulips
- “ red double Emperor's wreaths
- “ white and purple Franklin hyacinths
- “ jonquilles and lilies
- “ yellow melistote
- “ white hyacinths, with yellow eye
- “ Belle Agathe hyacinths, porcelain blue

Large, yellow crown imperial; large red dog; gold striped dog; silver striped dog; Persian fritillaries; Chinese yellow tiger lilies; large yellow crocus; yellow pomponie lily; cloth of gold crocus; princess Estchazy hyacinth; superb dragon flower; polyanthus narcissus; purple crocus; matignon lilies; golden crown tulips, &c. Likewise, plain and colored bell glasses.—Purchasers may rely on the excellence of the above, as they were not purchased at auction, but are imported direct from the first florists in Holland, and are remarkable for their size, beauty or delicacy of tunc.

Furnham's Grater Cider Mill.

We the undersigned having seen Mr. Furnham's Grater Cider Mill in operation at the farm of Mr. John Parkinson in Roxbury, state as our opinion that the principle of said mill is well calculated for the purpose of grinding apples for the cider press and superior to any thing of the kind we have seen. We witnessed its operation, and found its motion to be equal to about 100 revolutions per minute. At this rate it ground one bushel of apples in 52 seconds, with an eight inch cylinder. We are also of opinion that with a cylinder with longer points, vegetables might be very advantageously cut for the use of animals.

Roxbury, Oct. 27, 1827.

JOHN FEINICK,

JOHN PARKINSON,

NATHAN SMITH.

I the undersigned certify that I was present at Mr. Parkinson's at the time the said mill was in operation, and am fully of the opinion that it will perform all that is above stated.

J. R. NEWELL.

For further information, application may be made at the Agricultural Warehouse, No. 52 North Market Street, Boston.

Typo-graphia.

An historical Sketch of the Origin and Progress of the art of Printing, with practical directions for conducting every department in an office; with a description of Stereotype and Lithography, illustrated by Engravings, Biographical Notices, and Particulars, by P. C. HARRARD. Just received, and for sale by P. & C. WILLIAMS.

Miscellaneous.

THE MOTHER'S DIRGE.

BY WILLIAM CAREY.

From bubbling streams, or springs that rise
In mountain grot or willow vale,
Bring water, while I close the eyes,
And kiss the lips so cold and pale.

From tufted grove and shadowy glen,
Untrod by the feet of men,
From sodgy banks and fragrant fields,
Bring every flower that nature yields;
And scatter every breathing sweet
On lov'd Maria's winding sheet.

Blest spirit newly freed from pain,
While e'er thy faded cheek I bend,
(Belov'd, and watch'd, and wept in vain,)
A moment more thy light suspend.

Behold, while hovering on thy wing,
With water from the bubbling spring
I wash thy limbs; I spread thy bier;
And lay thee down with many a tear,
Clad in thy shroud of spotless white,
To slumber through a weary night.

Thy tender smile, thy soothing voice,
Thy playful innocence no more
Thy fond, fond mother shall rejoice—
Thy little dreams of joy are o'er.

Of the mild graves of thy mind,
No token wilt thou leave behind;
No trace of thee will soon remain,
But in this breast a mother's pain;
A mossy grave; a humble stone,
To tell thy years and name unknown.

NEW ENGLAND.

"Thy cottage-homes, New-England,
How beautiful they stand
And the goodly green-wood trees
O'er all the pleasant land."

Such would, perhaps, have been the words of that "elixir" muse, the gifted poetess of England, in the beautiful stanzas descriptive of the rural scenery of the clime of our ancestors, if they had been applied to the land of the Pilgrims. It is a goodly sight to look on the green hills in the glowing spring time, when the insect hosts hum over the opening buds and the mild and balmy air winnows fragrance from the expanded blossoms, when the mighty power that regulates the course of the seasons, exerts its most mysterious action, and herb and tree are swelling with renovated freshness. But the landscape affords a more delightful prospect when the forest has put on its robe of many colors, and he who will climb the heights overlooking, like watch-towers, the yankee land, and stretch himself out under the shade of the huge walnut, in one of those sun-bright days that gladden the declining year, may contemplate a richer picture than poet or painter ever imagined. The sabbath stillness of the cool and invigorating air will be broken only by the dashing of the serene and withered leaf in the silver stream that winds along the hill side downward, the valley, or the frolicking of the squirrel gathering in his harvest of nuts. Beneath him he may see fields covered with flocks and herds, or perhaps goodly plantations of honest pumpkins sunning themselves and turning up their yellow backs among the corn-hills, to prepare themselves for the festivities of the "thanking" that comes as sure as time himself. He must be blind indeed if he does not refresh his eye on the orchards with their rosy-checked fruits, and

the gardens with the jolly sun-flowers lolling their broad good-humored faces over the walls, and the roofs peeping out from among the trees, with the smoke rolling up in graceful curls.

"Thy free, fair homes, New-England—
Long, long at freedom's call
May hearts of native proof be reared
To guard each hallowed wall,
And green forever be the groves,
And bright the flowery soil,
Where first the child's glad spirit loves
Its country and its God." *Worc. Aegis.*

Militia.—Much has been said and written by the malicious wits of the present day, against our militia system. But really all this availeth nothing; they might as well blow their puny breath against a hurricane, or attempt to climb a rainbow, feet foremost. Who knows better what is for the good of the country than our Legislature, three fourths of whom are, or have been, militia officers? But in order to silence the tongue of malice "forever and a day," we will endeavor to set forth a few of the numberless advantages of our militia system.

1. It is the "bulwark of our country." This being a self-evident proposition, cannot be made plainer by argument. A cart load of the finest syllogisms in the country would not render it a whit plainer or truer.

2. It makes a very interesting spectacle for little boys and great girls—which is certainly a matter of no small importance, when it is considered that many of our country towns are not blest with a show of wild animals, above once in two or three years.

3. By burning a nation sight of powder, it makes way with a good deal of "villainous saltpetre" and every thing under heaven that is villainous ought to be attacked *et cetera*, and blown "sky high, sky high," as Johnny Randolph saith. Again, it removes from the face of the earth, along with the villainous saltpetre, a vast deal of that "infernal drug" which is so offensive to all well bred noses, that it ought to meet with no quarter whatever in a polite and christian country.

4. It teaches men to love their enemies—"How! teaches men to love their enemies, quoth? A system of warfare teach men to love their enemies? A most heterodox way of loving truly!" Harken one moment—friend; there is no warfare about it; on the contrary, it is as gentle as a "sucking dove," and as peaceful as ever a toyshop in all the country. Nay, it teaches men to love their enemies almost to their own ruin—in truth they become enamoured of *blue ruin* itself. They hug the "black Betty" that contains it to their bosoms, and hang upon her lips, until at length they are glad to find a fence to hang upon.

5. "It wakes the soul by tender strokes of art"—by those soul-touching strains of music so melodiously beat out of windy sheepskin, or blown from the brazen throats of braying bugles, or sweetly and ingeniously hammered out of a tinabulary, triangular bit of steel.

6. It makes a holiday for men—full grown—from five and a half to six feet high—and between 18 and 40 years of age. Men absolutely require a *play-day* of some kind or other; and if they were not drawn out three or four times a year for military duty, would unquestionably run mad with domestic confinement, and breaking from their fields and shops, would prick up their ears, and prance and kick, to the manifest danger of all civilized society.

7. Being confined chiefly to the poorer class of our citizens, it helps to divest them of the little cash they have in their pockets, and prevents it from being lonesome, which a solitary dollar might otherwise be. And herein it is a fulfillment of scripture—"from him that hath" but a precious little, "shall be taken away, even that which he hath."—*Berkshire American.*

Destiny.—Hunt has recorded in the "Periodical of Pisa," one of those little tales, so common in the East, inculcating the great oriental dogma of fatality. Solomon was walking in his garden with one of his attendants, when he observed a strange and fearful figure approaching them. "Solomon," said the attendant, "who is that mysterious being, his appearance fills me with dread; send me, I pray thee, to the remotest mountain of India." "The king in his quality of magician, sent him thither. The figure approaching, said, "Solomon, how came that man here? My errand was to seize him on the furthestest mountain of India!"—"Angel of Death!" replied Solomon, "thou wilt find him there!"

Bull Young Admiral.

The above named superior animal, of two years old this summer, 3-4ths of the "Improved Durham Short Horns," of 1-lb the "Gore breed," and obtained the first premium at Brighton, is offered for sale at the low price of *one hundred dollars*—and would be let for two or three years, to a respectable man on reasonable terms. Apply to JOHN PRINCE.

Rochury, Oct. 25, 1827.

Mr PRINCE can also sell two or three fine 2 years old heifers in milk—at the half blood of the "Durham Short Horns," and first rate native cows.

Merino Sheep for Sale.

One hundred, the greater part *Essex*, at Winchendon, county of Worcester, Mass. Apply to Seth Tucker Jun, of said Winchendon. Also about one hundred at Windsor, County of Berkshire, in said Massachusetts. Apply to Edward Whittington of said Windsor; or application may be made to Nathaniel Tucker of Milton, County of Norfolk.

Winter Keeping for Horses in the vicinity of Boston.

Where the most faithful care may be relied on, or may be had on application to Major Samuel Jaques, Charlestown, or at the N. E. Farmer Office. An early application is desirable.

JAMES BLOODGOOD & Co's.
Nursery, at Flushing, on Long-Island near New York.

IN behalf of the proprietors of the above nursery, the subscriber solicits the orders of horticulturists who may be desirous of stocking their gardens and fields with fruit trees of the finest sorts and most healthy and vigorous stocks the present autumn.

Bloodgood & Co. attend personally to the inoculating and grafting of all their fruit trees, and purchasers may rely with confidence that the trees they order will prove genuine.

The subscriber, agent of the above nursery, will receive orders for any quantity of

FRUIT AND FOREST TREES,
FLOWERING SHRUBS,

AND
PLANTS.

And the trees will be delivered in this city at the risk and expense of the Purchaser; the bills may be paid to him.

The reputation of this nursery is so extensively known and has been so well sustained that I take leave to refer those in want of trees to any of the Horticulturists in this city and its vicinity, and let their demonstration be desired. I invite those who wish to be thus satisfied to examine the trees in my garden at Dorchester, procured from this nursery for three or four years past, some of which are now in bearing, all in a healthy and vigorous state.

Catalogues will be delivered gratis on application to
J. B. COOK, Jr.
Rogers' Building, Congress-Street

McMahon's Garden.

Just received at the New England Farmer office, a further supply of McMahon's American Almanac. This work is the most elaborate of the kind ever published in this country, comprising ample directions for the management of the kitchen garden, fruit garden, orchard, vineyard, nursery, pleasure ground, flower garden, green house, hot house, and forcing frames, for every month in the year.

THE FARMER is published every Friday, at \$3.00 per annum, or \$2.50 if paid in advance.

Gentlemen who procure are responsible subscribers, are entitled to a *SIXTY* gratis.

REPORTS

OF THE
MASSACHUSETTS AGRICULTURAL SOCIETY.

REPORT VII.

The Committee on Agricultural Experiments, consisting of the Hon. THOMAS L. WINTHROP, Chairman,—Hon. ISAAC THORNDIKE, Hon. WILLIAM PRESCOFT, BENJ. GULLD, and JOHN C. GRAY, Esq.—to whom was also committed the inspection of sundry articles of Manufacture, for which premiums were offered. Report,

That six parcels of cheese of more than one year old, and seventeen parcels of cheese of the present year, from the dairies of farmers in New Braintree, in the county of Worcester; one parcel of old cheese, from the dairy of Mr. B. C. Perkins, of Becket, in the county of Berkshire; and one parcel of new cheese, from the dairy of Mr. Luther Chamberlain, of Westborough, in the county of Worcester, were offered for the Society's premiums—of the old cheese, that from the dairy of Mr. Elisha Matthews was considered by your committee to be the best, and they award to him the premium of ten dollars. Mr. Hollis Tidd is entitled to the premium of five dollars, for the next best. They award to Mr. Welcome Newell the premium of ten dollars, for the best new cheese; and to Mr. Roswell Converse, five dollars for the next best. To Mr. Charles Cutter, of Weston, they award the premium of fifteen dollars, for the best sample of butter; to Mr. Michael Crosby, of Bedford, the premium of ten dollars, for the next best; to Mr. Luther Chamberlain, seven dollars for the next best; and to Mr. Adam Hemenway, of Framingham, the premium of five dollars for the next best. The butter and cheese now offered, is superior in appearance and flavor to any heretofore exhibited; this in part may be attributed to the past favorable season, and in part doubtless to more particular attention in the manufacture. Mr. Ebenezer Withington, of Dorchester—Mr. Timothy Wellington, of West Cambridge—and Mr. Jonathan Parker of Newton, severally, offered samples of honey for premium. Your committee award to Mr. Withington ten dollars, taking into consideration the quantity of his honey, and also his communication on the best mode of managing bees. There were only two competitors for the premium offered for the best sample of currant wine. Mr. John Heath, of Roxbury, and Mr. William Kenrick, of Newton—to the former the committee award the first premium of ten dollars; and to Mr. Kenrick, the premium of five dollars. In the opinion of your committee, but little, if any improvement has recently been made in the manufacture of this article.—Two barrels of cider were offered for the Society's premium; the committee after carefully tasting the liquor, were of the opinion that the cider in neither of the casks was sufficiently good to be entitled to a premium. It is much to be regretted that our brother farmers pay so little attention to the manufacturing of a liquor, which ought in our country, generally, but more particu-

larly in the northern States, to be substituted for ardent spirits; and when carefully made is superior to the common wines of Europe.

Mr. John Webber, of Beverly, exhibited his annual offering in aid of the show, of some canisters filled with excellent mustard, of his own manufacture. All which is respectfully submitted.
THOMAS L. WINTHROP, Chairman.

The following letter of Mr BALDWIN was accidentally omitted last week. It is in reply to the Queries of the Massachusetts Agricultural Society to the several successful claimants for the premiums on orchards. These Replies have proved very interesting and acceptable to those engaged in the management of orchards and nurseries.

1. I have planted 365 trees.

in 1816	44 trees.
1817	98
1818	30
1819 & 20	78
1821—27	55

— 305.

2. The following is a list of the trees, of which I know the kind of Fruit; the rest are of the various best kinds, generally winter fruit.

Russet	94
Greening	37
Baldwin	18
Nonsuch	5
Pearmain	3
Golden Russet	1
Cat Head	6
Ribstone Pippin	5
Spitzenburg	8
Pumpkin Sweeting	2
Peck's Pleasure	2
Porter	1

— 185 known

— 180 unknown

— 305

3. Except three trees, they were all raised from the seed, and grafted or inoculated on the farm.

4. They were all planted in newly broken up ground.

5. They were planted 6 or 8 inches deep—no stones were put beneath them, nor any unusual mode of planting adopted—nearly half are planted at 35 feet distance each way, the rest 25 to 30 feet.

6. The ground when not planted, has been ploughed and hoed round the trees.

7. I have pruned in spring and autumn, but most freely in spring, which I prefer.

8. I have ploughed and hoed as stated in the 6th answer. They have been manured every other year.

9. I have no peculiar mode of treatment.

10. My trees have had many borers in them, which I cut out—I know no other remedy. I have lost no trees by them.

11. I have scraped the trees and applied Forsyth's composition with an additional quantity of Lime, and think it beneficial.

ENOCH BALDWIN.

Norfolk, ss. Milton, October 8, 1827. Then

Enoch Baldwin made solemn oath to the truth of the above answers before me, J. KUGGLES.

Justice of the Peace

PEACH TREES.

The peach is the most delicious fruit that grows in this country; but the farmer does not rear the tree, because it "dies so soon." Experience has taught me that Peach trees will live and flourish fifteen or twenty years, if the ground in which they are planted be calcivated; but if their enemy, the worm (described in the following paragraph, be destroyed every year, I should suppose they will live much longer. Now is the time for destroying the worm, which is easily detected in its ravages if the directions of this receipt are pursued.

Peach Trees.—This is the season to destroy the pest which kills this valuable tree; just above the surface of the earth you will now find a gum, which has issued from the wound which the worm has made in his ravages on the root, and of the exudings of this gum he has formed a sack, in which he has enclosed himself, about one inch in length and of a dark brown color; looking much like tobacco thrown away after chewing. This contains an insect just ready to come forth with wings; it is of a beautiful black, and looks much like a wasp, not so long, nor with the small middle of that insect, but having around his body a ring of a bright orange color—in a few days these insects will be at maturity, and they immediately commence a new work of destruction, by depositing near the root of the tree their nits, or young, which in time are quickened and commence eating again. It is supposed that a covering which will prevent their access to the root of the tree, will preserve it from damage.—*Harrisburg Chronicle.*

Crops in Nova Scotia.—A respectable practical farmer, from Nova Scotia, has lately taken a tour through the townships of Woodstock, Walkfield, Richmond, and Jackson; about seventy miles or upwards, above Fredericton, on the river St. John. He has now returned, and informs us, that he is very much pleased with the appearance of those places; and states from particular observation and enquiry, that with the exception of wheat, which is there generally considered to be equal to half a crop, every other kind of grain, and also vegetables have turned out well; and that hay is abundant.—*St. John Gazette.*

Extract of a Letter from Fredericton.

"In some conversation I lately had with Mr. Campbell, of Nashwalk, he informed me that on a piece of ground where last year he cut only three tons of hay, this year he has cut thirty tons. So far as I can learn, the crops generally have been abundant, wheat being the only exception, and the failure in that having been occasioned by rust. In the upper part of this country, I learn, that the injury done to the wheat, is not near as great as has been represented. Potatoes, I bought, nine bushels to-day, at 1s. per bushel." The difference between the last and the present season, in the produce of hay upon the same piece of land, mentioned in the foregoing extract, is so great as to be truly surprising; but we know both the writer, and the gentleman whose name is mentioned, and can confidently vouch for their veracity.

AGRICULTURAL ADDRESS.

The following paragraph is extracted from the address of Philip Merrick, Esq. before the Agricultural Society of Worcester county.

"I am not unaware that there are those, who will not yield a willing attention to the suggestion, that the operations of the husbandman on his farm are to be essentially aided by results derived from scientific and philosophical investigation. They object that theory and practice are far different things: that the abstruse speculations of the closet are too subtle and refined for the actual labors of cultivation; and they confidently claim that the plain unsophisticated judgment which has been formed by practice is clearer and better than that which comes heavily lumbered with the conclusions of a life of study. They start back, as from mystical conjurations, from all book learning on matters of husbandry, with much the same undefined horror as our ancestors did from witchcraft—and with much the same reason too. Unwilling to be assured that science is, after all, nothing but perfected practice, they pray, with a shivering devoutness, that their farms may be spared from subjugation to the waking dreams and visionary innovations of the man of learning.—But let no hasty prejudice or thoughtless fear, extinguish, by their mistaken distrust, the glowing light of truth. Agriculture has itself, in all ages, received benefit from intellectual exertions—and through all the vicissitudes of time, mind has given confidence to energy, and direction to the active. In the most common pursuits, in the boldest exertions of enterprise, facilities for practice have been largely drawn from those sober places in which men of learning have been bestowed. When the hardy mariner goes forth upon his favorite element of tumultuous waters, his fearless intrepidity results not from confidence in his own manly strength, but from a well grounded assurance that learning has provided him with the means of steering his bark to another shore; and he remembers that science has taught him to look for the land marks of the deep in the well ascertained orbits of the stars above him."

OHIO POTATOE.

Mr Story of this village planted last spring in his garden a single potatoe, obtained of his kinsman Judge Cary, of Chenango county, the seed of which was said to be from Ohio, and which produced the present fall one hundred and thirty-six. Thirty-three of them filled a half bushel and weighed 25 pounds; of the rest seventy five were of a good ordinary size for culinary purposes; the remainder rather small, making in the whole about a bushel. His gardner, John Dutcher, who had the care of planting, hoing, digging, &c. deserves great credit, and can testify to the truth of the facts detailed. Another specimen of this excellent vegetable, raised in the same garden, is little less extraordinary. Twenty-five potatoes of the common kind were selected of this year's growth, weighing fifty pounds.—They are of an excellent quality. This will certainly yield additional inducements to a fresh supply of emigrants from the Emerald Isle.—*Cherry Valley Gazette.*

M. Delvan's Patent for making Tubes without Seams, of the Skins of the Legs of Sheep, for Spinning Factories.—It consists in cutting all round, above the claw, the skin of the leg of a sheep, pulling it off in the same manner that hats and rabbits are cased; then soaking it in limo water, to

cause the wool to separate from it, tanning it with oak bark, treating it with oil; cleansing it, and lastly, in currying it, and rendering it of an equal thickness throughout. The tubes, after being opened with instruments, or tools called *wolves' teeth*, are drawn over the bosses of the cylinders used for spinning cotton and wool, and are stretched tight by pinners. The tubes ought to exceed the bosses of each cylinder in length; and the parts of them which extend beyond the bosses are to be pressed down and tied, and to be fastened to the end of the cylinders with strong glue; the extremities are then to be rubbed with a wolf's tooth, to make the glue enter into the leather; and the cylinders are left in this state for five or six hours; after which the ligatures are taken off, and the ends of the skin which extend beyond the bosses, are cut away in a lathe. In taking them out of the lathe, the cylinders are rubbed with a cloth somewhat hard, to bring forth the polish of the skins.

London, New Month. Mag.

MEXICAN TIGER FLOWER.

This dower is of such exquisite beauty as to merit particular attention.—Hernandez, a Spanish physician, who was sent to Mexico by Philip II. king of Spain, informs us that it grew wild about that city, and was much cultivated for its excessive beauty, and for the medicinal virtues of its roots, being, as he terms it, a "frizgeriant in fevers, and a promoter of fecundity in women."

This flower has no scent, but in splendid beauty it has scarcely any competitor. It is born to display its glory but a few hours, and then literally melts away; but to compensate for this sudden decline, it continues to produce flowers for several weeks. The latter end of August is generally the season of its bloom.

If it properly a green-house plant, succeeds best in light mould, and is easily propagated by seed, from which the plants will flower the second year. The bulbs and offsets may be taken up in October, when the leaves are decayed, and kept in dry sand, saw-dust, or rolled up in dry moss till March; but they must be carefully preserved from frost. Or they may be replanted immediately in pots of fresh earth, and placed in the green-house; giving them but very little water, till they begin to vegetate in spring.—*M. Mahon's Gardener.*

The September number of Flint's Western Review contains an article describing a variety of beautiful trees and shrubs common to the valley of the Mississippi. The following elegant tree is thus described:

China Tree.—This is a tree more cultivated in the southern regions of this valley, as an ornamental shade tree than any other. It has fine, long, spiked leaves, eight or ten inches in length, set in corresponding pairs on each side of a stem two feet long. The verdure is of the most brilliant and deep in nature. In the flowering season, the top is one tuft of blossoms, in color and fragrance resembling the lilac, except that the tufts are larger. It holds in flower for a long time. It is a tree of the most rapid growth of any in our country. These trees, planted out in a village, in a few years completely embower it, and from the intemperance of their verdure, they impart a delightful freshness to the landscape, in that sultry climate. After the leaves have fallen in autumn, the tree is still covered with a profusion of reddish berries of the size of haws, that gives it the appearance, at

a little distance, of remaining in flower. Robins immigrate to this region in the latter part of winter, settle on these trees in great numbers, and feed on the berries. They possess an intoxicating or narcotic quality; and the robins, sitting on the trees in a state of stupefaction, may be killed with a stick. The bark is said to be a powerful veniafuge.

Extracts from "Gleanings in Husbandry and Rural Affairs."

Many people wonder why the curious enquirers into nature will give themselves so much trouble about exotic plants; but they do not sufficiently consider, that many kinds of grain, many roots, legumes, fruits, salads, and trees, in common use with us for nourishment, household utensils, clothing, and ornament, are originally exotic.

Stillingfleet's Tracts.

Humble Bees.—If a nest of the common Humble Bee (*Apis Terrestris*), or of the Black Humble Bee (*A. Subterranea*), is taken late in the evening, and confined for the night in a hive or box; they will not afterwards forsake it, but increase their comb and breed.

Black Currant Wine.—The process of manufacture is merely that of macerating the fruit, in an equal quantity of cold water, two or three days; then boiling the whole slowly, until the fruit is dissolved; when the liquor is strained off. Re-boul the liquor, gently, a short time; and add a quantity of sugar, proportioned to the given richness of the fruit; ferment, and lay up, agreeably to the methods practised with other fruit liquors.

Buckwheat was first brought from Africa into France, by the *Saracens*—and from France into England.—Is called by many French wheat.

It may be well for the husbandman to attend to the plants of Red Clover in the course of its growing. Some considerable variety appears in the character of the plants: He should note them, and sow the seeds of a head of each variety, observing the progress of the growth, hardiness, &c. It is the way of discovering the good sorts,—the best. The worst the field had better be cleared of.

A Dairy should be roomy, airy, and shaded from the sun, and the windows to face the north; wherever a stream of water can be brought through it, the opportunity should always be embraced.

Wooden vessels are supposed to be the best for holding milk, but unless kept clean, communicate a disagreeable taste to the milk.

One of the best methods of cleaning and seasoning wooden vessels for milk, is, after being well rinsed in cold water, to put them into boiling water for the space of about three minutes: then to be kept dry till wanted.

Erotics.—From some late attempts that have been made to raise plants natives of the East and West Indies in the open ground, it appears that several have flowered and ripened their seeds:—and it is much to be wished more efforts were made to increase the number of our useful plants. The late Dr Fothergill cultivated with the greatest attention, at Upton, near London, every plant that seemed likely to be of use in physic or manufactures, and which he could procure at any expense; and it is to be regretted, that the public were not made acquainted with the fruits of his

labour. The greatest difficulty is over after the plants have once ripened their seeds; as plants raised from such seeds, grow annually harder and quicker of growth.

With respect to fruit trees, it would be better to procure such as have been introduced from the Indies into Italy, Spain or France, than direct from the Indies into England; as for example, the Quinquina, Balm-tree, Sago, Cocoa, and other Palm-trees, by being first transplanted from their native soil into the *Canary Islands* and thence to *Andalusia*, the most southern province of Spain, at length have been, by successive transplantation, accustomed to the climate of *Madrid*.

Swine are ready for procreation at seven months old; but the male is unprofitable for that use, until twelve, and is in his prime at two years. The sow goes nominally four months, or one hundred and fifteen days, with very few days variation; bringing three litters, of from five to twelve pigs each litter, in about eighteen months, supposing the pigs to be weaned; but in two or three months less time, the pigs being suckled for roasters.—The old lopped eared make the best bacon; the Chinese, and crosses with it, the best pork; for which they will fatten in four or six weeks; and killed at eight or ten months' old, are esteemed more delicate, than if they were kept longer in the sty. Should be restrained to a certain quantity of water, and kept clean and dry; for cleanliness is as essential to the preservation of their health and well doing, as that of any other animal.

Two gentlemen in Lancashire have a breed between the Wild Boar and the Chinese; they have very light and small bellies; their sizes are but small, weighing from ten to fifteen score, generally twelve score.

There is an animal kept tame in some of the East India Islands, called *Baby-roussa*, of the same genus as the Common swine; which, if it would bear our climate, would be an useful animal, as it lives solely on herbs and leaves of trees, and never ravages gardens like swine; the flesh is well tasted.

The cutting away with a sharp knife, the gristly or horny part of the snout, through which the ring is usually put, will, without the least injury arising from it to the animal, effectually prevent its rooting.

Crows are terrible destroyers of Indian corn.—Blackbirds and squirrels are also great enemies to the corn crop; but the poor wood-peckers, accused of eating maize in the field, do but dig for and pick out worms; for which they deserve a premium, as these worms, in different shapes and characters, become enemies to vegetable productions.

For Inflamed Sure Eyes—White vitriol, one drachm, acid elixir of vitriol, twenty drops, and boiling water one pint: put the white vitriol into water, and when nearly cold, add the drops, and after add one large table spoonful of brandy or very old rum. If the above is found too strong, weaken each quantity drawn off with more or less rose water.

To take ink spots out of cloth or linen. Wet immediately the place with lemon or sorrel juice, or with white soap diluted with vinegar.

Cure for oxen strained by over-drawing.—About half a pint of common soap, stirred up with a quart of milk, poured down the throat of the creature will, we are told, speedily effect a cure.

From the Worcester Argus.

SELECTION OF FRUITS.

In turning the pages of catalogues of the extensive varieties of fruit trees contained in the nurseries, one is much perplexed to make a selection of choice kinds for the garden and orchard. A friend eminently successful in cultivation has kindly furnished us the following list of the best varieties, whose superior excellence has been tested by his own experiments. The wish that the benefits of his experiments may be extended, induces us to present it to our readers as a sure guide in their selections.

APPLES.

Summer. Harvest, Red Juneating, Early Bon. *Fall.* American Nonpareil, Princeall. *Winter.* Baldwin Pippin, Nonesuch, Rhode Island Greening, Peck's Pleasant, Spitzbergen of the new kind, Roxbury Russet, Tift Sweeting, Tolman Sweeting.

PEARS.

Summer. Early Chaumontelle, Skinless, Jargonelle, St Michael's, Seckle, Bergamot de Pasque, Satin Green, Charles of Austria.

Winter. King's Bon-cretien, St Germain, Colmar.

CHERRIES.

Ronald's Black Heart or Black Tartarian (best), May Duke, White Heart.

PEACHES.

Early White Nutmeg or Early Ann, Red Rare ripe, Parly York Island, Lemon Clingstone, Kennady's Clingstone, Early Admirable, Royal George Royal Kensington, Gross Mignon.

PLUMS.

The varieties of the Green Gage, and the Purple Gage.

GRAPES.

July Grape, Burgundy Black, White Chasselas, White Sweet-water, White Muscat, Miller Burgundy. The Auwiersgrape, is an early white grape, reported to be the best of all the natives of our country, and said to be hardy.

"*Letters from Europe*, comprising the Journal of a Tour through Ireland, England, Scotland, France, Italy and Switzerland, in the years 1825, '26 and '27."

Mr Carter's book has just been published by the Messrs Carvills, under the above title. It is in two handsome octavo volumes, of above 500 pages each, on fine white paper, and a beautiful type. About one third of the work, as we have been informed, is substantially new, consisting chiefly of letters written during the latter part of the tour, which were not published. It would of course be superfluous for us to speak of the talents and acquisitions of the author, or of the ease and fluency of his style: and the public have already been made acquainted with the plan and execution of a large portion of this book, which will no doubt be received with greater approbation and pleasure, from the improved and enlarged form in which it now appears.—*N. Y. Daily Adv.*

They have in exhibition at Philadelphia, the greatest Ox in the world, and the smallest Cow. The Ox is the Columbus, weighing 4000 lbs. and the Cow measures only 2 ft. 10 in height, and 4 ft 2 in length.

A few years ago all the flannels and baizes used in the country were imported from Europe. The severity of an American winter was moderated by the fabric of Wales and the fleeces of Saxony. Such an establishment as a flannel manufactory was unknown in the country. The tariff of 1816 gave encouragement to some branches of cotton, but woollen goods were partly unprovided for. The new protection extended by the law of 1824 has not been without its expected operation. Among other branches of manufactures, that of flannels is making a rapid progress. Already there are about six or eight establishments of this kind in the country, one of the largest of which is situated in Amesbury, in Massachusetts. Not long since one was erected in Connecticut, and recently its proprietor sent a very handsome assortment of flannels to this market, which entered into competition with those of English fabrics. It is known that the average prime cost of the article in this city amounted to 25 cents a yard; and at auction when they were sold, they brought 49 cents. The liberality of this price was occasioned by the beauty and texture of the goods, and its general excellence in comparison with the foreign. The growth and progress of manufactures cannot be impeded by any sectional differences of opinion. All the middle, eastern and western states are nearly unanimous in favor of this policy, and at the next session of Congress there is every probability that a new revision of the tariff will be made.

[*N. Y. Commercial Adv.*]

Early indications of Winter—On the night of the 7th inst. a severe snow storm commenced from the North and continued till the evening of the following day, and left us about a foot of snow on level. So great and early a fall of snow is hardly within the recollection of our oldest and most observing citizens. The tinkling of sleigh bells at this season of the year surprised us almost as much as to have heard them at midsummer. Indeed the sound was rather melancholy than exhilarating, as many of our farmers have not finished gathering their crops—Considerable produce from the neighboring towns was brought to market on Thursday in sleighs. We also learn, with surprise, that the mail coach from Litchfield to this city, was actually stopped by the heavy drifts of snow that had accumulated during the storm.—*Hartford paper.*

In Williamstown, a few days since, a young lady swallowed a pin which lodged about half way down in its passage to the stomach. Dr. Emmons took a piece of wire, fastened a piece of dry sponge to the end, and passed it down the passage below the pin; here it absorbed moisture, and became so much swollen, that in drawing it up, it brought up the pin.—*Hampshire Gaz.*

In a communication in the Georgetown Columbian, Mr Allam says there are now (Sept. 24) enough of wild grapes on the vines in Maryland to make 20000 tipes of wine!

Covering for Roofs.—A new substitute for slates has been adopted in England, and introduced extensively into use. A quantity of lime is slacked in tar, in which sheets of the largest and thickest brown paper are dipped and then laid on in the manner of slating. This is said to make a durable covering, answering every purpose of shingles or slates, and will effectually resist the weather for a great number of years.

[From Flint's Western Monthly Review.]

REED CANE.

Every one has seen the larger reed cane, in the form in which it is used for angling rods. It grows on the lower courses of the Mississippi, Arkansas, Red River, and their waters, from fifteen to thirty feet in height. We have seen some in these fertile bottoms, that would almost vie in size with the bamboo. The leaves are abundant, of a beautiful green, long, dagger shaped, and not unlike those of Egyptian millet, but narrower. It is marked off in equidistant joints, tubular, perfectly straight, and grows so thick, as to be almost a compact mass. To us it is the richest looking vegetation, especially in winter, through which it retains a perfect verdure, that we have ever seen. The smallest sparrow would find it difficult to fly among it; and to see its ten thousand stems rising apparently contiguous to each other, and to look at the impervious roof of verdure, which it forms on its top, it has the aspect of being a solid layer of verdure. A man could not make three miles in a day, through a solid and unbroken cane brake. It is the chosen lair of bears and panthers, which break it down, and make their way into it, as a shelter from the elements and man. Thousands of the more delicate birds take refuge in these verdant asylums from the storms of winter. Its presence indicates a rich and dry soil, above inundation. The ground is never in better preparation for maze, than immediately after this prodigious mass of vegetation is first cut down, and burned. When the cane has been cut, and is so dried, as that it will burn, it is an amusement of high holiday for the negroes to fire a cane brake so prepared. The rarefied air in the hollow compartments of the canes burst them with a report, not much inferior to that of a musket, and when the field is extensively fired, a noise ensues like that of a conflicting army, in which innumerable muskets are continually firing.

There are different estimates of the duration of this beautiful vegetable, but it is generally supposed to have a life of five years; at the end of which period, if it has grown undisturbed, it produces a most abundant crop of seeds in heads very like those of broom-corn. The seeds are farinaceous; appear and taste like wheat kernels, and are said to be not much inferior to that grain for bread, for which purpose the Indians, and in some cases the first settlers, have substituted it. No vegetation so impressively shows the exuberant prodigality of nature, as a thick cane brake. No other affords so rich and perennial a range for cattle, sheep, and horses. The butter that is made from the cane pastures of this region, is of the finest quality and flavor. The seed easily vegetates in any rich soil. It rises from the ground like the ranket asparagus, with a large and succulent stem. It grows six feet high, before the body loses this succulence and tenderness, in hardening into wood. No vegetable or grass in the world, probably furnishes so rich and abundant a fodder of so rapid a growth. The quantity of seed, that could be obtained from an extensive cane brake in seed, would exceed any possible amount, that would be required in agriculture. It could not indeed arrive at seedling maturity in the northern latitudes. But the interchanges of all things of use in our country are so rapid and certain at present, that the seed could be obtained cheaply, and with ease, annually from the south.

When we have seen the stems of this rich fodder, rising almost in a compact mat to the height of four feet in a few weeks, after the old cane had been burned away, when we have calculated, what an amount of it might be raised on a single acre, it has a thousand times occurred to us, to wish that the cultivation might be tried, as a fodder, at the north. In our view it were well worthy an experiment, to sow it annually in regions of a latitude too northern, for it to survive the winter.— Kentucky was once, as is well known, almost a solid cane brake. There can be no doubt, that it would grow as rapidly in New York or Massachusetts, in the intervals between the frosts, as it does in Louisiana.

From the Middletown, (Conn.) American Sentinel.

APPLE PUMICE.

On taking notice of large heaps of apple pumice, near some cider-mills in the vicinity of Middletown, I am induced to mention, that it is good for cattle, sheep and swine, and ought not to be wasted, for it is good for nothing for manure: I tried it more than 40 years ago, by carting away a large heap of it, which had lain accumulating many years, and was satisfied that it did not pay me for my trouble: I could not say it helped the crop, although it was put on sandy land, and the land inclined afterward to be mopy, and bore less grass. It was according to my father's custom, and the practice of steady habits, to keep milk cows away from pumice, but wishing to prove all things, I kept a cow principally upon it more than 3 months in the year 1786, feeding her sparingly at first, for a few days, and then letting her lie at a heap which was replenished with fresh pumice every few days, and where there was little else to eat, and we thought she did as well as the other cows which lay in good rouse feed, and it did not dry up her milk, as farmers generally suppose it will. If a cow eats her fill of apples, it checks her milk, and so it will if she eats her fill of grain, and overeating grain sometimes causes death, yet cows might do well on apples after being accustomed to eat them, even by lying in an orchard and eating as many as they wish: if cows are allowed to take their fill of pumice at first, it may check their milk, and make them stagger; it is the distention of the stomach, rather than the injurious effects of the apple or pumice, that checks the milk. I have never wasted any pumice since my experiment, when I have owned a cider-mill, but in the year 1791 I sold my place and bought another farm, and had no cider-mill for many years, but the trouble of going a mile to make cider, loss of the pumice, and paying for the use of the mill, induced me to build one near my house where two men could easily roll a hoghead of cider from the mill into the cellar.

No pumice has been suffered to lie near the mill since it was built: we place a cart close to the press, and throw in the pumice and carry it away and spread it for cattle to eat, throwing a little to the hogs, (which is but very little more labor than to carry it by hand two rods, and throw it in a heap,) and the cattle will eat the pumice, and the apple seeds which scatter are picked up by the fowls.

I like this practice better than to have a heap of stinking pumice near the mill, which is not worth carrying away. If you have more pumice than your cattle will eat, you can dry it, house it,

and feed it out in winter, it will be saving hay. I have told many farmers of my practice, who feed out pumice in the same way; and if I have published something like it before, the reader will excuse me for having it printed again, when we are sensible that many people read very superficially, and most people are apt to think their own method is the best, and it becomes necessary to give precept upon precept; but I have no motive but public utility.

I have also published how to make cider, but people like their own mode best, although Newark cider sells in New York for 4 or 5 times as much as that which is made in New England: and I think it is wrong to have the Yankees so much undone: but making cider is nearly done with for this year. I hope that some more of our farmers will, at least, feed out a little pumice for a trial, against next year. A FARMER.

From Louden's Encyclopædia of Agriculture.

SHEEP IN SPAIN.

The sheep of Spain have long been celebrated. Pliny relates, that in his time Spanish clothes were of an excellent texture, and much used in Rome. For many centuries the wool has been transported to Flanders, for the supply of the Flemish manufactures, and afterwards to England, when the same manufacture was introduced there. By far the greater part of Spanish sheep are migratory, and belong to what is called the mesta or Merino corporation; but there are also stationary flocks belonging to private individuals in Andalusia, whose wool is of equal fineness and value. The encase of the sheep in Spain is held in no estimation, and only used by the shepherds and poor.

The flocks which form the mesta usually consist of about 10,000 sheep. Each flock is under the care of a directing officer, fifty shepherds and fifty dogs. The whole flock composing the mesta, consist of about five millions of sheep, and employ about 45 or 50,000 persons and nearly as many dogs. The flocks are put in motion the latter end of April, or beginning of May, leaving the plains of Estramadura, Andalusia, Leon, Old and New Castile, where they usually winter; they repair to the mountains of the two latter provinces, and those of Biscay, Navarre, and Arragon. The sheep, while feeding on the mountains, have occasionally administered to them small quantities of salt. It is laid upon flat stones, to which the flocks are driven, and permitted to eat what quantity they please.

In September the sheep are oched, their backs and loins being rubbed with red ochre, or ruddle dissolved in water. This practice is founded upon an ancient custom, the reason of which is not clearly ascertained. Some suppose, that the ochre uniting with the oleaginous matter of the fleece, forms a kind of varnish, which defends the animal from the inclemency of the weather. Others think the ponderosity of this earth prevents the wool growing too thick and long in the staple. But the more eligible opinion is, that the earth absorbs the superabundant perspiration, which would otherwise render the wool both harsh and coarse.

Towards the end of September the flocks recommence their march. Descending from the mountains, they travel towards the warmer parts of the country, and again repair to the plains of Leon, Estramadura, and Andalusia. The sheep are generally conducted to the same pastures they

had grazed the preceding year, and where most of them had been yeaned: there they are kept during the winter.

Sheep shearing commences the beginning of May, and is performed while the sheep are on their summer journey, in large buildings. Those which are placed upon the road, are capable of containing forty, fifty, and some sixty thousand sheep. The shearing is preceded by a pompous preparation, conducted in due form, and the interval is considered a time of feasting and recreation. One hundred and twenty-five men are usually employed for shearing a thousand ewes, and two hundred for a thousand wethers. Each sheep affords four kinds of wool, more or less fine, according to the parts of the animal whence it is taken. The ewes produce the finest fleeces, and the wethers the heaviest: three wether fleeces ordinarily weigh on the average twenty-five pounds; but it will take five ewe fleeces to amount to the same weight.

The journey which the flocks make in their perambulation is regulated by particular laws, and immemorial customs. The sheep pass unmolested over the pastures belonging to the villages and the commons which lie in their road, and have a right to feed on them. They are not, however, allowed to pass over cultivated lands; but the proprietors of such lands are obliged to leave for them a path, about forty toises (eighty four yards) in breadth. When they traverse the commonable pastures, they seldom travel more than two leagues, or five and a half miles a day; but when they walk in close order over the cultivated fields, often more than six varas, or near seventeen miles. The whole of their journey is usually an extent of one hundred and twenty, thirty or forty leagues, which they perform in thirty or thirty-five days. The price paid for depasturing the lands, where they winter, is equally regulated by usage, and is very low; but it is not in the power of the landed proprietors to make the smallest advance.

The public opinion in Spain has long been against the mesta, on account of the number of people it employs, the extent of land it keeps uncultivated, the injury done to the pasture and cultivated lands of individuals, and the tyranny of the directors and shepherds. These have been grievances from time immemorial. Government, yielding to the pressing solicitations of the people, instituted a committee to inquire into them about the middle of the eighteenth century; but it did no good, and it was not till the revolution of 1810, that the powers and privileges of the mesta were greatly reduced.

From the St John (N. B.) Gazette.

PROVINCIAL CATTLE SHOW.

Pursuant to a Resolution of the New Brunswick Agricultural and Emigrant Society, a Cattle Show was held on the 9th ult. at the Race Course in this Town.

The day was unfavorable, yet the Exhibition was numerously and respectfully attended. It was honored with the presence of His Excellency Sir HOWARD DOUGLAS, who came from St John, for the purpose of attending on this interesting occasion, and expressed himself highly gratified with the scene.

Three premiums (amounting to \$125, 00) were awarded for the finest horses—Among the Stock entered for Exhibition only were two remarkably

fine Dray Horses, being stock from the noted Horse Goliath, imported by the Hon. John Coffin. Ten premiums were awarded for the best Bulls, Cows, Oxen, Calves, Sheep and Swine.

The Show, both as regards the number and excellence of the Animals exhibited, far exceeded the expectations which the public had formed. The Horses of the Draught breed exhibited by Mr Vail of King's and Mr Hewlett of Queen's County, were much admired, as was also the fine two years old Colt belonging to Mr. Coullif, of Woodstock; but none of the stock appeared more to attract the attention of the spectators than the beautiful bull calves, belonging to Messrs. Hammond of Kingsclear.

These were from the imported short horned Durham bull, Hanover, purchased by the Society from Hugh Munro, Esq. of Bathurst, and afterwards sold to Mr. Archelus Hammond. Colonel Miles' calf was rather larger than either of these, but for beauty and valuable points they cannot probably be surpassed in these colonies.

Several superior animals were exhibited but not entered for competition; for these, the bull, heifer, ram, ewes, and lambs—boar and sow, belonging to his Excellency Sir Howard Douglas, were considered admirable specimens of their kinds, as were also the two Ayrshire cows owned by the secretary of the Central Society.

The striking improvement in some species of the stock, and the interest which the public appeared to take in the exhibition give assurance that our future Cattle Shows will be still more interesting and highly promotive of the agricultural interests of the province.

R. SIMONDS, Secretary.

BRISTOL CATTLE SHOW.

The annual meeting of the Bristol County Agricultural Society, and agricultural and manufacturers' Exhibition, took place in Taunton, the 30th ult. The Ploughing Match was first in the order of the Exhibition; and at 9 o'clock ten teams were entered and engaged in an animated contest for the premiums offered by the Society. It is praise due to all in an unusual degree, to say, that the work was done well. In some past years, the teams may in some instances have executed their task with more despatch; but it seemed, and very properly, the present year, to be in an especial manner, an object to make perfect, as well as quick work.

The show of Cattle was probably equal to the former Exhibitions of the Society. The pens were wholly filled and contained some animals which would do credit to farmers in any part of the country. Of the Manufactures, there was a variety; some of a superior quality and of a kind not before exhibited; but we have no room for an enumeration or description of them.

The gentleman who had been designated to deliver the address having failed the Society, the Rev. Otis Thompson read an address which had been previously delivered on a like occasion. From the meeting house the society proceeded to Atwood's Hotel, and partook of a bountiful and well served dinner. The premiums were declared and officers chosen in the afternoon, of which a notice will hereafter be made.—*Taunton Rep.*

It is said that Sir James Mackintosh has sold his History of England (now finished) to Messrs. Longman & Co. for six thousand guineas.

Darwin's plat form balances, for weighing, are said to be the most perfect ever invented. The balance is capable of sustaining ten tons, and at the same time will weigh one or two pounds with precision, which care and tender cover, it is calculated the apparatus would last 25 years. Mr Darwin of Boston has rendered great service to mechanics by his inventions, among which this is not the least valuable.

To make Tomato Ketchup.—For half a gallon, take a gallon of skinned tomatoes, 4 table-spoonfuls of salt, 4 of black pepper, half a spoonful of allspice, 8 pods of red pepper, 3 table-spoonfuls of mustard; grind them finely, and simmer them slowly in sharp vinegar, in a pewter basin, 3 or 4 hours, strain it through a wire sieve, and bottle it closely. Those who like the article may add, after the ingredients are somewhat cool, 2 table-spoonfuls of the juice of garlic.

American Manufactures.—It is stated in the *Patterson Intelligencer* that a wealthy English gentleman is now erecting in the state of New York, a Cotton Factory of fifteen thousand spindles and four hundred power looms. He has likewise given orders for his machinery to be made at the Patterson Factory.

He who has a friend, has a enemy.

FRANKLIN.

I have seen the young man born to affliction for tune, who was early appreciated to a respectable and scientific mechanic, to learn what is generally termed a trade. Although there was no apparent need of such a step, as the father was an independent man; still the old man conceived that it was necessary, and often made the observation, that "he who has a trade, has an estate." The young man duly served his time, and became a complete master of his trade; and this son had the happiness to contribute to the ease and support of his truly respectable parent in his old age,—(who had lost through misfortune his business property,) and while performing this pleasing, sacred duty, his talents and industry raised him to an enviable situation in life.—*Troy Budget.*

To make durable Candles.—To 10 ounces of tallow, add a quarter of an ounce of camphor, 4 ounces of beeswax, and 2 ounces of alum; melt them all together, and make your candles.

For the Whooping Cough.—The following has been recommended:—Dissolve a scruple of the salt of tartar in a gill of water, add ten grains of cochineal finely powdered, and sweeten with brown sugar. Give to an infant the fourth part of a table spoonful four times a day, and from four upwards a spoonful may be taken.

In the *London Weekly Review* there is a most entertaining notice of the recently published *History and Antiquities of London*. In page 214—15, there is a description of a sumptuous entertainment, which is thus ushered in by an account of the boiling of a cook: Richard Rose, cook to the Bishop of Rochester, according to his sentence, was boiled to death in Smithfield, in 1531, for poisoning sixteen persons with porridge, which he had prepared for the destruction of his master, who fortunately escaped the intended mischief by the want of appetite, which prevented him eating that day.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, NOV. 16, 1827.

REMARKS ON THE IMPROVEMENT OF LIVE STOCK.

We received some time since a pamphlet of our first page No. with the above title printed in London, New Brunswick, and so designating it in either north or south parts of the world, it is not a new discovery, but it is a new one to us, and we are glad to see it in our hands. It is a very useful production, and we are glad to see it in our hands. It is a very useful production, and we are glad to see it in our hands.

It is not possible for us to follow the author through the more technical parts of his work, or to say which is more to the purpose of improving the breed of animals, or that of saving ground, or of saving labor, or of saving ground, or of saving labor, or of saving ground, or of saving labor.

The principal defect in the character of these animals is that they are so celebrated in their early management, or produced in such a manner as to be fit for an earlier age than any other kind whatever. This is done in such a manner as to be fit for an earlier age than any other kind whatever.

It is not possible for us to follow the author through the more technical parts of his work, or to say which is more to the purpose of improving the breed of animals, or that of saving ground, or of saving labor, or of saving ground, or of saving labor.

and question, that they are the cheapest cattle a man can possess, for they are the most profitable; and great as the sum certainly is for an animal, he is only exchanging value for value.

The partiality of individuals for the cattle of their own home into country or district, led many to give them the preference over the Short-horned, and so on, as the excellence of many of them, that are so much talked of, might exist, may well be excused. The Alceyney, Heilsmans, and others, are celebrated for their milking powers. The Devon stands especially high, and the fine cattle of Herefordshire are carried away, probably more prices at Smallfield, than any other. But for a combination of the most valuable properties, it is now generally allowed that the Improved Short-horns excel. Not only in England, but the demand for them grows, not only in Scotland and Ireland, but purchase great numbers, where they are highly thought of, and eagerly sought after.

The Causeur estimates weents are the best conducted in England; and there the conduct of the dairy-men offers a fine example to the country. These hold cows to be in their prime from four to ten years of age, and seen to be as long as they milk well, and in fact they are fit for a longer season. I mean to make the exception of early milking, which I should be tempted to keep to even twenty years of age; but I yet think, generally, cows are not at their best until five years, and on the decline at eight, when I apprehend it must be for the interest of the dairyman to sell, or put them to keep, fat, and I think few can suffer from an extension as constant milking to the eighth year, without deterioration.

If the quantity holds, the quality becomes poor, and the appetite of the animal increases. These cows will eat considerably more than four fattening bullocks. They find here, as elsewhere, that great milking and great proof in beef, are incompatible. One year is taken to keep the cattle in good condition during the winter, for the milk will give good reason. The Chesbire men wisely consider it a great object to turn their cows to grass in good condition, as they say, "to start them out," meaning that if otherwise, and their juices are tied up with straw feeding, and the scarcity of the winter's milk, the animals are long before they recover their milk-making powers, if ever they do recover them under such circumstances.

To the personal attendance, bits of masters and servants seems to be most exemplary on all occasions. Paths and mangers are cleared and kept very clean, and a particular attention paid to the removal of the excreta of the beasts, before milking, to prevent the matter from being found from spreading to, or diminishing, the quantity of milk.

It is not possible for us to follow the author through the more technical parts of his work, or to say which is more to the purpose of improving the breed of animals, or that of saving ground, or of saving labor, or of saving ground, or of saving labor.

is less liable to waste, than when given loose in the field; and the cattle being regularly fed in such a place, fatten quicker than when abroad—the exertion necessary to procure their food being less. Some intelligent men in the country, instead of yarding, prefer feeding altogether in the stall, during winter, turning the beasts out only for water and exercise. This system may be pursued with advantage; much food being saved, by feeding in the house, and a great quantity of manure and straw be had in sufficient quantities to let the stall. To be continued next week.

TEA.

A great deal of declamation has been printed and spoken on the subject of tea-drinking. Some good people consider it almost as criminal to indulge in drinking tea as in making a too free use of ardent spirits. Dr Ross and Dr Cooper, however, and many other medical writers approve of drinking tea, with proper precautions. Dr Cooper says, "If good tea be drunk in moderate quantities, with a little milk and sugar, it invigorates the system, and produces temporary exhilaration, and a surplus of tears. But, when taken too strong, and copiously, it is apt to occasion slight tremors of the system, similar in a degree to those arising from narcotic plants; but as it contains gallinule and tannin in moderate proportion, I regard them as a whole, as a most wholesome, grateful, and essential beverage, affording the safest and pleasantest refreshment after great bodily fatigue or mental exertion; at the same time tending to support and promote that perspiration, and a might otherwise be impeded."

Moreover, a late English writer on economical subjects has the following observations on this beverage: "The present topic of the comforts of the laboring classes, naturally introduces the modern but now universal habit of drinking tea. The late Mr Arthur Young, with perhaps a less profound intellect than he usually bestowed on his subjects, took every opportunity of expressing his unwillingness to allow to the sons and daughters of labor their share in this common privilege; and Mr Young, I observe, has successors in this opinion. Tea making it is objected is a grand consumer of time, and the beverage itself a debilitating, rendering those who use it, delicate and unfit for labour. It may be replied, that the most expeditious meals, necessarily consume time; that in order to make tea, too often bitter draught of labour go down, and to insure a higher degree of cheerfulness and good will, some portion of respite and relaxation is necessary. Tea is certainly a mere diluent and detergent, altogether devoid of the nutritive properties of beer; it is at the same time a cooling, sedative, and refreshing drink, extremely agreeable and pleasing to the stomachs of those who are fit with the most ordinary, the hard, and coarser professions. As a relaxant it often proves equally beneficial as agreeable to the robust, and to those of rigid fibre. Nor have I ever known an able laborer, or any well-to-do laborer, injured in his strength by the custom of drinking tea. A particularly for this Asiatic herb, has long since taken possession of the whole people of this country; and I must confess, I see no reason for attempting to wrest the great majority of their share of a common right, which really ought, in this commercial country, to be within the compass of their means."

Miscellaneous.

BOSTON HUMILIANS.

A Song for the Ploughmen.

Ye are sons of New England, high lands of the soil
With hands ever ready to give or to toil—
The harvest is heaping o'er valley and plain—
Come, come, to its festal of labor again.

We don't not the olive, we want not the vine
Nor the orange and citron we do not require
We look at no clamor with curious eyes,
For what nature edifies our labor supplies.

But our country we serve, when we follow the plough,
For 'tis seldom a farmer is going his brow;
And I tell that we love, is the pledge of our faith
To the land that we live in—through danger and death.

Then long be the land of the shade of the tree,
Marjory's hills, in industry free,
And long may its harvest be a beautiful wave,
And long may they gladden the hearts of the brave.

(Boston Courier.)

Singular Dish.—To make this inimitable dish, (the roll a *l'empatrie*;) take out the stone of an olive, and fill the cavity with shredded anchovy. The olive, so stuffed, must be put into a lark, the lark in a quail, the quail into a partridge, the partridge into a pheasant, the pheasant into a turkey, and the turkey into a sucking pig. Let a brisk fire amalgamate well the juices of these various meats, and serve it up. But hold, rash one!—touch it not with your knife; throw the whole out of the window, save the olive, in which the quintessence of the whole of the surrounding materials is concentrated. Swallow the olive; but have near you a bottle of ether, for it is probable you may faint with pleasure. Some epicures reject even the olive, eating only the shredded anchovy. —*Conf. Gourm.*

Insane persons, on an average, eat twice as much as sane persons, and they absolutely require more food than people, in sound mind and body. —*Knight on Lunacy.*

A new mode of administering medicine is now rapidly gaining ground in Germany. Instead of the large doses prescribed in this country, very minute quantities are given, and, as it seems, frequently with good effect. So small a quantity of blue pill as the fiftieth part of a grain is sometimes administered; and of sulphate of quinine, a medicine of which the ordinary dose here is three or grains, one twentieth part of a grain is ordered. It is difficult to conceive how so little medicine produces a sensible effect; but if it is often found to answer, the practice must be very beneficial to debilitated persons, who are in this country frequently sent speedily to the grave by medicine.

Flames Tamed.—On Tuesday Mr. Howell reported that on the preceding day he had commenced a forward movement with the S. F. M., and that having overcome the late serious difficulties, and the bed of the river having been re-examined by new burnings, the expectations of a successful completion of this great undertaking are higher than before the interruption of the river. —*Lea's Jn.*

Mr. Deane is superintending the Virginia Cotton Factory, and white work people are to be exclusively employed. The success of this factory will diminish the inducements in Virginia to keep slaves.

Money.—Bacon, the English philosopher, compares money to manure. If gathered in heaps, it does no good, but on the contrary becomes offensive—spread it, though ever so thinly over the surface of the earth, and it enriches the whole country.

There's no place like home.—Home can never be transferred! never repeated, in the experience of an individual. The place consecrated by parental love—by the innocence and sports of childhood—by the first acquaintance with nature—by the linking of the heart to the visible creation, is the only home. There is a living and a breathing spirit infused into nature—every familiar object has a history—the trees have tongues, and the air is vocal. There the verdure of decay does not close in and control the noble functions of the soul. It sees, and hears, and enjoys, without the ministry of gross material substance.

Some parents, even those that are wealthy and aspiring to style, instead of endeavoring to inculcate in the infant minds of their children a mode of speaking, make use of an incoherent gabble, which a conjurer can scarcely interpret. The consequence of which is, that their children being disposed to learn the first words they hear, acquire a silly and disgraceful dialect, which very often affects their speech, more or less, during life. It were well if parents would recollect the importance of speaking to children, and endeavoring to make them speak in the language of correctness. This cannot be effected if they use, or suffer others to use that sort of baby talk, which so often misleads and abuses the faculties of children. —*Warren Star.*

The Richmond Enquirer, of the ninth, contains an article in favor of manufactures, signed a Virginian.

Hay.—Charles Chidden, Esq. of Northfield this year cut four tons of good English hay from one hundred and one square rods of ground. Three tons were produced at the first crop, cut the second week in July; and one ton at the second cutting the last week in August. It is believed this beats the great crop in Northwood, and shows how much a little land, if highly cultivated, will produce. —*N. H. Patriot.*

Cruelty.—We are informed that very serious inconvenience, and indeed danger, results from the practice of gunning over the grounds of the farmers in this country. Fences are thrown down—domestic animals are sometimes wounded and killed—trees and crops are injured. All this for the sport of killing the little singing birds which as food are not worth the ammunition. Every Sunday is a great day of sport for these trespassers; they are mostly boys or young men who are not controlled by any superiors, and who are probably dissipating the money of others, and laying the foundation of future wretchedness. —*Brooklyn pap.*

Stump pulling machine.—A Mr Pratt of Jackson, Washington county, New York, has invented a very useful machine for moving stumps and other heavy and fixed bodies. It will also be highly useful in removing buildings, trees, rocks, and in grubbing lands in the construction of canals and turnpike roads in which a vast deal of labor may be saved. The capacity of the machine to perform what is promised is commended in Albany.

A young Counsel, who was rather given to *broag beating*, had a favorite mode of mystifying a witness by saying, "well, sir, I shall only ask you one question, and I do not care which way you answer it." Mr Brougham, who was on the same circuit, accosted his friend one morning— "Well, Jones, I have but one question to ask you, and I do not care which way you answer it. It is do you do to-day?"

Grass Seeds.

For sale at the office of the New England Farmer, No. 52 North Market Street, Boston, a large variety of Grass Seeds, comprising LI. CERNÉ, POMA, MEAD, & HERB'S GRASSES, RICH THYME, & PURKLE, FLOYER &c. with the latest assortment of *Grass and Field Seeds*, to be found in New England. —*For, 25 bushels fresh Canary Seed, and the English Rape Seed; Hemp Seed, &c. for bulk.*

Purkin's Great Clearing Mill.

We the undersigned having seen the Farquhar's Greater Clearing mill in operation at the farm of Mr. J. P. Parkinon in Roxbury, state as our opinion that the principle of said mill is well calculated for the purpose of grinding apples for the cider press, and superior to any thing of the kind we have seen. We witnessed its operation, and found its motion to be equal to about 100 revolutions per minute. A bushel of ground one bushel of apples in 55 seconds, with an eight inch cylinder. We are also of opinion that with a cylinder with looser joints, vegetables might be very advantageously cut for use as manure.

Roxbury, Oct. 27, 1837. JOHN PRINCE, JOHN PARKINSON, NATHAN SMITH.

I do hereby certify that I was present at Mr. Parkinon's at the time the said mill was in operation, and fully of the opinion that it will perform all that is stated.

J. R. NEWELL. For further information, application may be made at the Agricultural Warehouse, No. 57 North Market Street, Boston.

JAMES BLOODGOOD & Co's Nursery, at Fishing, on Long-Island near New York.

IN behalf of the proprietors of the above nursery, the subscriber solicits the orders of horticulturists who may be desirous of stocking their gardens and fields with the best trees of the finest sorts and most healthy and vigorous stock, for the present autumn.

Bloodgood & Co. attend personally to the inclosing and grafting of all their fruit trees, and purchasers may rely with confidence that the trees they order will prove genuine.

The subscriber, agent of the above nursery, will receive orders for any quantity of

FRUIT AND FOREST TREES, FLOWERING SHRUBS, AND PLANTS.

And the trees will be delivered in this city at the risk and expense of the Purchaser, the bills may be paid to him.

The reputation of this nursery is so extensively known and has been so well sustained that I take leave to refer those who want trees to any of the Horticulturists in this city and its vicinity, and if ocular demonstration is desired, I invite those who wish to be thus satisfied to examine the trees in my garden at Dutchess, procured from this nursery for three or four years past, some of which are now in bearing, all in a healthy and vigorous state.

Catalogues will be delivered gratis on application to ZEB. COOK, Jr. Rogers' Building, Congress-Street.

360 Grape Vines.

For sale in Charlestown, by Samuel R. Johnson. The above choice vines are of the *New France* species, all raised from cuttings, and are from 3 to 4 years old, most of them in a bearing state. Orders for the above may be supplied at J. R. Newell's Agricultural Establishment, No. 52 North Market street, or by the subscriber in Charlestown's price for each vine is from twenty-five to fifty cents, according to its age and size; all the above vines have been trained to trellises and insured to be as healthy as any can be presented for sale. —SAMUEL R. JOHNSON

M'Mahon's Gardener.

Just received at the New England Farmer office, a further supply of M'Mahon's American Gardener. This work is the most elaborate of the kind ever published in this country, comprising ample directions for the management of the kitchen garden, fruit garden, orchard, vineyard, nursery, pleasure ground, flower garden, green house, hot house, and forcing frames, for every month in the year.

The FARMER is published every Friday, at \$3.00 per annum, or \$2.50 if paid in advance.

Gentlemen who procure five responsible subscribers, are entitled to a sixth volume gratis.

AGRICULTURE.

TO THE EDITOR OF THE NEW ENGLAND FARMER.

CANKER WORMS.

MR FESSENDEN.—There are many, I believe, who have their doubts as to the efficacy of tarring, in preventing the attacks of the canker worm.—Their scepticism on this subject is, in all probability, derived from their own experience or observation. They have often applied this remedy, or seen it applied, to no purpose.

I have a few facts to present for the consideration of your readers relative to this practice, which I offer with the more readiness, since they are from a respectable and intelligent cultivator.—He states that some years ago his apple trees were attacked by the canker worm, notwithstanding a constant and regular application of tar. He was satisfied that they could have effected their ascent neither before, nor during the operation of tarring, for he commenced as soon as the ground opened in the spring, and continued it without intermission, until they "had done running." How then did they accomplish their ascent? This was a question to which he could give no satisfactory answer; it occasioned him a good deal of perplexity, and finally put him upon a thorough examination. This examination resulted in the discovery, that the female being foiled in her attempts to ascend the trees, had deposited her eggs in immense numbers, in the crevices of the bark below the tar; whence the young brood as soon as they had acquired the power of locomotion, were rising and making their way into the trees, the tar having, by this time, become sufficiently hard to afford them a safe and easy passage.

Upon this discovery all the difficulties which had hitherto attended his speculations on this subject, vanished at once. He saw the evil in connexion with its cause, and was happy in a conviction that an adequate remedy could be easily applied; being sensible that the same means which were successfully employed to baffle their attempts to ascend in the first instance, would have proved equally efficacious in the second. Those, therefore, who would preserve their apple orchards from the ravages of the canker worm, in this way, would do well to continue the operation of tarring long enough to prevent the ascent of the young, or dislodge the old ones from their lurking places in the crevices of the bark.

November 19, 1827.

H.

FOR THE NEW ENGLAND FARMER.

VINES.

MR FESSENDEN.—Every lover of the vine must witness with pleasure, the many indications which your columns afford of the increasing attention at present, paid to its cultivation. I have always cherished the idea that with judicious culture, the vine might be made to yield its fruit among us; and the little experience which I have had for a few years past, has strengthened my belief as to its practicability; and any one who will try the experiment, will soon be convinced, not only that it is possible to raise grapes, but that the chance of a full crop when compared with peaches or

pears, is as two to one; or in other words he will realize two crops of grapes to every one of either peaches or pears, yet no one seems to doubt of the possibility of raising both of them.

The "numerous ills" which the peach tree is "heir to" prevent us 3 times out of 4 from realizing any return for our labor, save a full crop of excretion. Let the time of the cultivator which is now spent in administering quackish remedies to valetudinary peach trees, be spent in the cultivation of grapes, and he will find his labour blest with a plentiful reward.

I would observe here, that I have found but one effectual remedy for the worm in peach trees, and that is oil applied near the roots: but as I found in the application of it in that way, the remedy was as bad as the disease, I soaked strips of stiff paper in old, strong smelling oil, and wound them round the trunk as high up as was considered necessary. The paper imbibes the oil so strongly as to prevent it from penetrating into the body of the trees; where it would be very injurious, and ultimately ruinous to the tree.

I perused with much interest the translation published in your paper, of the method of training and pruning the vine, practised at Thomery, near Paris; and was disappointed on finding the plan recommended was liable to the same objection as those which have been described and recommended by Forsyth, Cobbett and others, i. e. the impracticability of covering the vine in the winter.—This point is but little attended to by French and English gardeners, as their comparatively mild winters seldom render covering necessary; but it should be the first point attended to, when devising a regular system of training, adapted to the climate of the New England States. The best directions that I have seen were published originally in the Massachusetts Agricultural Repository, and was copied from thence into the pages of the New England Farmer, but not having the paper by me, I cannot name the number.* The plan recommended is very similar to that generally practised by the cultivators of the vine in the north of France and Germany; and the directions if strictly followed, will insure success. The idea of Mr Kenrick, of training the vines on the plan of the Thomery gardeners, yet limiting the height to 9 inches, appears hardly practicable, if the vines are to be planted only 20 inches apart as will be obvious to any one reflecting that in this space 9 inches wide, there must be trained the 4 lateral shoots, proceeding from the vines planted to the right and left of the centre one, and thus reducing the space from 18 inches to a fraction less than two. But probably his intention is to plant 8 feet apart in the rows; he can then bring the horizontal shoots of each vine to an equal height from the ground, without one interfering with the other; if so the plan is a good one. The advantages derived from close planting can be realized here as well as in the other way, as the rows can be planted very near together.

If you think the preceding remarks are worth the room they will occupy in your paper, you may insert them, as from an

ADMIRER OF HORTICULTURAL PURSUITS.

* See New England Farmer, vol. v. No. 13, page 57.

AN ADDRESS,

Delivered at the Anniversary of the Hartford County Agricultural Society, Oct. 4, 1827; by FREDERICK HALL, Professor of Chemistry and Mineralogy in Washington College.

Mr. President,
and Gentlemen of the Society,

The subject on which I am requested to offer you some remarks, is one of vast moment, and one which is indissolubly connected with the vital interests of our State and of our nation. But it is a hacknied subject—one which has called into action a thousand able pens—one which has been examined and re-examined, times without number, and presented to the public eye in every conceivable point of view. In the compass of a few brief, scattered hours—and that is all, that could be allotted for the preparation of the address—what can be said, that is new, or will be useful?

You, gentlemen, do not need to be told, that agriculture had its origin in olden time—in a golden age—that it was practised by the Grecians, by the Egyptians, by the Chaldeans; that it climbs even to a higher date, that it was the first science communicated from heaven to fallen man. He who stood at the head of our species, when removed from the garden of untainted purity, where labor was useless, was commissioned to be a farmer—"to till the ground, from whence he was taken."

It is superfluous to remark, that practical agriculture has, in all periods, been regarded, by the truly great, as one of the most honorable occupations that could engage the attention of man.

Abraham, whose life was devoted to his flocks, who was as the scripture informs us, "very rich in cattle, in silver, and in gold;"—was held in high estimation by the different nations with which he sojourned, and by their princes and sovereigns. The kings of Persia, once a month, laid aside their royal vestments, and went forth into the fields, to converse with husbandmen, and to dine with them. The modern emperors of China pass one day each year, we are told, in personally guiding the plough.

Will a farmer easily be inclined to believe, that his employment is a degrading one, when he reads the history of the Romans—when he learns, with what rapturous delight, the most distinguished of their generals, and dictators, and sovereigns pursued it?—how they panted for exemption from the toils and butchery of war, that they might be taken themselves to the peaceful business of cultivating their grounds?

Regulus, when commanding the Roman legions in Africa, earnestly besought the Senate to recall him, on the ground that if he were longer absent, his friends would suffer from neglect. What answer did the Senate transmit to him? That so long as he successfully commanded their armies, his farm should be taken care of at the nation's expense.

Do you imagine, gentlemen, that agriculture was lightly esteemed, by the best friends of Rome, at the period, when Porcius Cato, a valiant warrior, and an implacable enemy to every thing that did not tend, directly, to advance the welfare of his country, wrote a treatise on it? It could not be.

The emperor, Diocletian, renowned for his military virtues, and as the patron of letters, resigned, voluntarily, the sceptre of the world, for the dominion of a little farm at Salona. When urged, afterwards, "to re-assume the imperial purple," what was his reply? "That he now took more delight in cultivating his little field, than he formerly enjoyed in a palace, when his power was extended over all the earth." A poet says—

"Metinks I see great Diocletian walk
In the Salonian garden's noble shade,
Which by his own imperial hands was made.
I see him smile, methinks, as he does talk
With the ambassador, who came in vain
To entice him to a throne again."

Can it be credited, that husbandry was held in low repute, when Virgil put forth his immortal Pastorals and Georgicks—when he sung—

"What makes a plenteous harvest, when to turn
The fruitful soil, and when to sow the corn;
The care of sheep, of oxen, and of kine;
And how to raise on elms the teeming vine?"

These admirable poems, characterized by elegance, and sprightliness, and keen rustic wit, and tart repartee, may be read, with profit, even by farmers of this enlightened age. They will find, in them, judicious directions for ascertaining the qualities of different soils; for meliorating those which are sterile; for the raising of cattle and sheep, and bees; and for the growing of grain, and fruit trees, and vines; with innumerable other useful operations.

There are spots on the earth, where agriculture attained to a higher perfection, before the Christian era, than it can in any country boast, at the present hour. In illustration of this sentiment, I beg you, Gentlemen, to cast your eye on ancient Egypt; and to look, also, at the land of Israel, at the time when David, the shepherd king, committed the reigns of empire into the hands of the wisest of men.

The Jews, always an agricultural nation, had little commerce, and few manufactures, and yet what a vast multitude were maintained on the products of their soil? When Joab gave up the census of the people to his royal master, there were, in the realm, no less than thirteen hundred thousand men, fit to bear arms—more than ten times the number, that our country ever had in the field at once, during her struggle for independence. These were the warriors of Israel only. What, then, must have been the amount of the entire Jewish population? It could not have fallen far below ten millions; and yet the nation possessed but a very limited territory;—a territory, which, in its broadest dimensions, never equalled, in size, one fourth of New England; nor was it, by nature, more productive. The land not only yielded food sufficient to fill the mouths of these ten millions, but also considerable quantities for exportation. Solomon, in exchange for "timber of cedar, and timber of fir, from Mount Libanus," gave to the king of Tyre yearly for the maintenance of his household, "twenty thousand measures of wheat, and twenty measures of pure oil."

Who can tell, but New England—the asylum of the oppressed—a refuge for the persecuted pilgrims,—will, one day, be as thickly populated, and as productive as Palestine once was? Who can tell, but our hills and mountains will, hereafter, be terraced, like those of Judea, and crowned with rich gardens, and luxurious vines, and golden corn? To you, gentlemen, it belongs to solve this question. If that auspicious event ever be present.

it must be owing, chiefly, to the bold, but judicious enterprise, and sleepless industry of American agriculturists.

Should war and pestilence—those cormorant devourers of man, not be suffered again to rage for two centuries; and should the arts of husbandry and horticulture move onward, with as quick a step as they have done for twenty of the last years, the event might occur.

Before a long period shall have passed, the western forests will all be levelled:—The valleys of the Mississippi and Missouri will be crowded with inhabitants;—the Rocky Mountains will be skirted with numberless farm-houses, and bustling villages, checkered, here and there, with magnificent domes and temples, pointing their glittering spires towards a holier world.—Commerce, with her innumerable attendants, active and bustling, will be seen blowing her silver trumpet along the shores of the Pacific; a New York of the west will spring up at the mouth of the Columbia, and monopolize the trade of that unmeasured region;—her streets will resound with the rattling of carriages and the ceaseless din of business;—her ports will be thronged with steam-boats and merchant ships and men-of-war, assembled from all nations. Then will the West re-act upon the East. The tide, which has long been setting in that direction, will flow back towards the Atlantic. Our population will then be quadruply dense—every hill and dale, and nook will be occupied—every spot of earth will be tilled and made to teem with exuberant harvests. But I am wandering in a fairy field.

The employment of the husbandman cannot be too highly extolled for the salutary effect it produces on the mind and on the body.

The scholar, who, with untiring zeal, has, for months, been poring over the dusty records of ancient lore, and has, like Aristotle, denied himself the relaxation that nature demands, at length becomes worn down by the burden of hard mental labor. His body is debilitated—his mind has lost its energy, and he is, apparently, posting to the grave. With strong reluctance he quits his books and returns home, to engage in the business of cultivating his father's farm. He holds the plough at first with trembling hand—he then plies the hoe—swings the scythe, and wields the ax. And what follows? Soon he experiences a physical and intellectual regeneration. The shattered frame is rebuilt—his limbs gather strength—his mind vigor and elasticity, and soon he returns to pursue his academic course with increased zeal and redoubled success.

The lawyer, immured in a contracted apartment, in the midst of a thronged city, gives himself, night and day, to the duties of his arduous profession. The knotty points of the law perplex him; jaded by the calls of loungers, and empty-pocketed clients, and breathing nothing but smoke and dust, and a mixture of all the gases that ever saluted the nostrils of the chemist, he shortly sickens and is nigh unto death. The prescriptions of the physicians are without use—medicine only hastens his pace towards the tomb. Perhaps, he is not prepared to meet, without dread, his ghostly majesty—the king of terrors. Perhaps, his heart is unreluctant to his God, and he trembles at the thought of being speedily arraigned at the Judgment Bar. In a word, the prospect before him is awfully gloomy.

As a *dernier* resort; as the last hope of recovery—and that hope is fast dying away in his bosom—

he retires to the country; places himself in the family of an agricultural friend; partakes of his wholesome fare; shares in his labors and toils, and, ere two short months have taken their flight, his gloom is turned into joy;—he is in the possession of vigorous, robust health.

Yes, my friends, rural labor and rural air are a far better restorative than all the drugs of the apothecary. They are the true *panacea*—long eagerly sought by the alchemists—a sovereign remedy for half the maladies, that assail our species. They give new life to the laid up clergyman—to the sickly merchant—to the drooping matron, and to the lily-checked damsel.

Who in the city does not sometimes covet the enjoyment of country air, and country scenery? At the approach of the sultry season, does not Boston pour forth her thousands, and New York her tens of thousands, to inhale the fragrance of the new-mown grass, and the health-generating breeze of the mountain and of the forest? Is not your profession, Gentlemen, an enviable one?

Of what importance are farmers to the community, except as *tillers of the ground*? They are the bone and muscle and nerve of our republic. They are our bulwark, and, under God, our defence. Had it not been for their courage and hardihood, what would now have been our condition? Slaves to arbitrary power—*vassals* to a foreign despot.

Who was the American Fabius, who conducted our armies to victory, and gained for the nation independence, and for himself imperishable fame? He was a farmer. And who were his illustrious companions in arms? Who was the death-daring Putnam? The valiant Gates? The persevering and dauntless Lincoln? All farmers. And who composed their armies? Who constituted that noble phalanx, that scorned their enemies, and tread them under their feet? Our brave and enlightened yeomanry.

And should the Almighty ever curse the nation by bringing upon it the necessity of another mighty army, for our defence, or for our protection; from what quarter must its generals and its soldiers be derived? Chiefly from the cultivators of the soil. We are not to look to the children of the opulent, whose childhood and boyhood have too often been spent in the cradle of luxury—who have been fed upon ambrosia and quaffed nectar—for brave soldiers, or skillful generals, for those who will cheerfully breast themselves against a hostile foe, and dare the cannon's mouth. They have not the soul of a Putnam, nor his herculean arm.—There are, it is true, exceptions, and illustrious ones, but they are few, and far asunder. These doughty warriors of the parlor would, it is likely, conform to the prudent instruction of the poet.

"He that fights and runs away
May live to fight another day."

And this, Gentlemen, is not all. Our pulpits are to be filled principally from your ranks. From your number, too, are to come most of our future physicians, and lawyers, and philosophers, and foreign ambassadors.

The generation of talented men—of men fit to occupy the highest stations in our country—is short-lived. Money may be accumulated—overgrown estates may be created; and, in monarchical governments, transmitted from father to son, through a long succession of centuries. But our happy government allows of no entailments. We have no monopoly of wealth, that is of more than ephemeral duration.

The fact is so common that it becomes an adage; "that *property* does not continue in the same family more than three generations;" it seldom does more than two. And does *talent* remain in the same family for a longer period? Nature seems to forbid a monopoly in this article. No, Sir, the race of the great, like that of your horses and your sheep, literally, *runs out*; and in no country sooner than in our own.

Look at the men, who *now* occupy the seats of the great. Whence came they? Who is that eastern Demosthenes, whose profound reasonings and soul-thrilling eloquence control, at his will, courts and senates? He is the son of a farmer. He was reared where corn grows and gives to boys rosy cheeks and well compacted limbs, and intellects worth owning—among the rocks and mountains of New Hampshire. And who is his honored compeer of the west—a man who stands high in office—and is heir apparent to the first dignity in our country's gift? He is the son of a planter.

Hundreds more, in responsible stations, in church and state, might be named, who commenced their career in tending cows and ploughing the field. And this, Sir, is the very best *primary school* that can exist.

Had I a son, whom I wished to educate for the pulpit, for the bar, or for the popular assembly, I would commit him early to the care of a moral, judicious, enlightened farmer. With him he should pass his summers, in tilling the ground and gathering in the harvest, till fifteen years had passed over him. Then, with firm limbs, a consolidated constitution, and a mind vigorous and elastic, he should enter on his literary preparation for usefulness and distinction.

Look at our academies, and other institutions. Whence came their best scholars?—their greatest ornaments? Chiefly, but not exclusively, from the plough.

It is not from the bold, brazen faced youth of the city, who comes to college, clothed in sumptuous broadcloth, and richest silks, with a servant at his back, to gratify his every whim, that we expect the best things. No, Sir, it is rather of the lad, covered with homespun, who comes, with his bundle of books under his arm, laboring up the hill, and sweating profusely, but never seems to mind it—of the lad, unpractised in the ways of vice, unaccustomed to the faces of men, ignorant of every body but Virgil and two or three other ancient gentlemen of Rome and Greece, but intimately acquainted with them, that we augur most favorably. At the sight of such an individual, I sometimes say, almost instinctively, that bashful boy will make a scholar—a Dwight, an Edwards, a Bowditch, an Ellsworth, a Washington. Do you account it no honor, Gentlemen, to be able to supply our literary and scientific institutions with a large proportion of their most promising members, and our country with its most distinguished and useful men?

In relation to the present life, all other professions, in point of importance, fall infinitely below yours. All others might be suspended without producing the entire ruin of society. Others are important, and some of them immeasurably so.—Physicians will be needed, so long as disease shall sack the human frame. Lawyers will be needed, as long as contentions exist—as long as sin shall maintain its throne in the human heart. Clergymen will be needed, till the lost image of God shall be re-impressed on all the fallen family; or

till the arch-angel's trump, from the battlements of heaven, shall summon the world to its final reckoning.

Agriculture is *essential* to the very existence of community. A few scattered savages might roam the forest, and subsist on roots and vegetables and the game that chance threw in their way.—But a moderately dense population cannot be sustained without your aid.

Besides, agriculture, says Xenophon, but we do not need this testimony—"agriculture is the nursing mother of the arts."—"Where agriculture succeeds prosperously," he adds, "there the arts thrive, but where the earth lies uncultivated, there the other arts are destroyed."

Yes, suspend your agricultural operations, and what becomes of manufactures and commerce?—Let the grower of cotton and the raiser of sheep relinquish their occupation, and of what value are carding machines, and spindles, and power looms? Let the farmer produce food sufficient for his own consumption only, and where would be the busy traffic, in meat and flour, and a thousand other articles, that is now carried on in all our cities?—Who would supply the markets and fill the mouths of the clustered citizens. Famine, and pestilence and death would immediately ensue.

I have shown you, Gentlemen, that practical agriculture occupied the attention of the first inhabitants of the earth—that in some countries, it was at an early period, carried to great perfection,—that the tilling of the ground has been accounted an honorable employment, in all ages:—that the greatest of men—generals, princes, emperors have pursued it, and have preferred it to the possession of thrones:—that it is a restorative of health. I have shown you that a large share of the honor of achieving our national independence belongs to farmers, and that they are, and ever will be, the chief support of our republic:—that their families are the primary schools, from which come most of our ablest divines, our wisest statesmen. I will only add: Go on and give perfection to the noble work you have begun. Make your fields produce double the crops they now do. Plough them more; you will have your reward in the harvest. Render your lands rich by manure, and then, by a due alternation of crops, they will always continue rich, without additional manure.

The greatest barrier, I apprehend, to improvement in husbandry is, Gentlemen, the aversion, which most farmers have to the making of experiments. They follow, tenaciously, the track marked out by their ancestors, seventy years ago, and cannot be persuaded, in the slightest degree, to deviate from it.

"The slaves of custom and established mode,
With pack-horse constancy they keep the road,
Crooked or straight, through quags or thorny dells.
True to the jingling of their leader's bells."

The present, Sir, is an age of experiment. What would chemistry now be, had it not been for the experiments of Davy, Gay-Lussac, Thenard and Murray? A minute detail of the experiments, which have been made in this department within the last thirty years, would fill hundreds of volumes. By these experiments, nature, tortured in ten thousand different ways, has been compelled to disclose to man more than half her mysteries. By these, *principles* have been developed, and the consequence is, that chemistry has been elevated from a heterogeneous and indigested

mass of facts to the rank of an exact and illustrious science.

Imitate the chemist. Introduce experiments in agriculture. Carefully record the result of each, and publish the record to the world. In this way, innumerable facts will be offered to the public eye, which will hereafter be of incalculable utility to our country.

In your endeavors to elevate the character of agriculture, do not attempt to depress manufactures or commerce. If you do, believe me, you will be at war with your own interests. These three branches are sisters, of equal worth, and must walk onward, linked arm in arm. They will thrive, or fall together. Injure one, and the effect is felt by all.

Close up the manufacturing establishments, and what encouragement will the farmer have to raise more wool or cotton than would be sufficient for his own consumption? Place an embargo on our shipping, and what inducement would the manufacturer have to fabricate more articles than would supply the home market? In both of these cases, the chill of death would run through all our manufactories, and all our agricultural interests. These branches of business deserve high, and equal patronage. Cherish, then, a liberal spirit towards them all. But let your mightiest energies be expended in perfecting the honorable profession to which you belong. And may He,—who sitteth on the circle of the heavens, and directeth the seasons, (without whose favor your happiest labors would be fruitless,) crown, with desired success, all your efforts.

Apolling Facts.—It has been ascertained that in the city of New-York there are 3000 licensed grog shops; that at least three-fourths of the tenants of the Alms-House become such in consequence of intemperance; and that nine-tenths of the cases which are brought before the Justices of the Police, arise from the same cause. As the annual expense for City Poor is about \$50,000, it follows that \$30,000 is the annual tax laid upon our citizens by this vice, to say nothing of the large amount which is voluntarily paid by its victims.

Errors of the Press.—When it is known that from fifty to a hundred thousand types are picked up singly and put in their proper places for each day's paper, it will not appear extraordinary that occasionally one or two of them will get into the wrong places, or that in making up a body containing so many small parts, errors should sometimes occur.

The London papers mention, "that within the short period of three years, £600,000 sterling worth of machinery has been exported from England for the use of foreign industry."

Early Snows.—A correspondent of the Portsmouth Advertiser, has given the result of observations made in Portsmouth, since 1811, respecting early snows, by which it appears that the earliest snow fell during this time, was on the nineteenth day of October, 1821. The earliest sleighing was on the 21st of Nov. 1826.—*Saltem Obs.*

William Wilkinson, Esq. of Providence, has presented fifty volumes of valuable books to the Mechanics' Library in Newport. Other handsome donations have been made to it.

[From the Georgetown Columbian.]

WILD GRAPES.

Sir.—As the common Fox grape and other large grapes are now ripe, and other grapes will be ripening in succession until after frost, I wish to draw the attention of our farmers and others to this object. I am led to do this, as there is not one person in one hundred thousand that knows or has any idea of the advantages we possess at the present moment.

There are thousands if not tens of thousands of bushels of wild grapes of various kinds, now growing in the different sections of our country, each bushel of which will make from two to three gallons of wine; much better than the wretched stuff imported in wood called Claret, and other "rot gut" imported wines of low prices.

I had some Fox grapes gathered for experiment, from where they grow naturally; after bruising them and straining them through a thin piece of muslin, I tried the specific gravity, and found it to be 1.055, which was the average of three different wines, and which is equal to one pound four ounces of the sweet principle, that is [sugar] to the gallon of the juice or must.

To make wine of wild grapes.

Gather the grapes when ripe, and bruise them with a mallet, or in any other way, just to crack the skins is sufficient, but take great care not to bruise the seeds—and when the grapes are bruised, put them into an open headed cask or tub, but do not fill it more than two thirds full, where they are to remain from one, to two, or three days, according to the temperature of the weather, or until the pulp or coloring matter is dissolved. The skins and seeds will have risen to the surface and the wine is to be drawn off by a hole made within one or two inches of the bottom; the wine will run off tolerably clear; but have a hair sieve to let it run through to catch every thing that may run off with the wine. When you have the wine drawn off, add sugar to your taste, or it is a better way to add sugar until a fresh egg swims just so that the upper edge is even with the surface of the must, and as soon as it is dissolved, put it into a clean cask well fumigated with a sulphur match and bung it up tight; bore a small gimblet hole near the bung, into which put a peg, not so tight but that a little air may escape to keep the cask from bursting. In about three weeks, drive the peg in tight, and it is not necessary to look at it again until the first week in December, when in nine cases out of ten, the wine will be perfectly fine and bright;—you need not be under any apprehension about the fermentation, as it will go on its own way, and nature will perform her office in the best manner possible.

On a clear cold day early in December examine your wine, and in nine cases out of ten it will be completely fermented, and it will be perfectly fine and bright. Then rack it off into a clean cask,—fumigated with a sulphur match, and in the month of March following, rack it again as above—and if it should not be perfectly fine, fine it with [finer wine] the whites of eggs—if white wine, with milk.

If all these operations are done with proper care, it will then be incorruptible; and last for an age, or ages if necessary.

I am here speaking of the Fox and other larger grapes.

If the smaller grapes are used, such as the fall

or frost grapes or others, as the chicken or pigeon, which are full of seed and have thick clammy juice, it will be necessary to add from one gallon to a gallon and a half of water to the bushel of grapes, either before or after they are bruised, the grapes to be first measured in the clusters—put the water to them a little more than milk warm, and rub them well with the hand, then put them into a cask or tub as above mentioned, and follow the directions given for the manufacture of the Fox grape wine. In rubbing them with your hands, it is very easy to get most of the stems off the grapes, and if separated, will make a neater wine.

Where you have not the means of getting the instruments for ascertaining the specific gravity of the must of the grape, and you wish a wine to keep for an indefinite length of time, the way is to add sugar to the must slowly, and dissolve it until a fresh egg swims, so that the upper edge is just even with the surface of the must of the grapes, which will then be equal to about three pounds of the sweet principle (sugar) to the gallon; where there are about two pounds of the sweet principle in the gallon, it will make a wine that ought to be drank within the twelvemonth following. But for your grog bruisers, whiskey, rum, and Madeira drinkers, who drink for the "intoxicating quality and not for the flavor," it will be necessary to add from three to four gallons of strong brandy to the barrel of wine. With four gallons of brandy to the barrel, that wine which has but two pounds of the sweet principle to the gallon, will suit most vitiated tastes best.

There is now a sufficient quantity of the wild chicken and frost grapes within half a mile of my house to make a pipe of wine, and I should suppose that in Montgomery County, which joins the D. of C. there are wild grapes sufficient if they were gathered to make between one and two hundred pipes, otherwise they will be left to fall and rot on the ground or be eaten by the birds, and in the whole state of Maryland there is now at this present moment, enough of wild grapes on the vines to make two thousand pipes of wine, and many of the other states would produce as much which would be worth, if properly manufactured, from fifty to one hundred cents the gallon.

September 24, 1827.

JOHN ADLUM.

P. S. I have always observed, that the wild grapes are infinitely more abundant in slatey, gravelly, sandy and other poor land than on the rich limestone lands.

SHADES.

It was with pleasure I observed, that a writer in one of the morning's papers, has called the attention of his fellow citizens to the importance of availing themselves of the present season for planting trees in front of their dwellings.

A great diversity of opinion is entertained as regards the kind of tree to be preferred. For my part, I should prefer trees of a quick growth, (thick foliage and widely spreading limbs,) that do not attain a great height, are clean and clear of caterpillars, bag-worms, &c. and do not injure the pavement. The only kind that I know of, that answers this description, is the Paper Mulberry, many beautiful specimens of which, may be seen in our vicinity. The following are a few of those which I can at this time point out, viz: In several of the streets in the vicinity of, and west of the navy yard, in South Second street,—below Catharine, and one door

north of the Old Ebenezer Church, several in South Fifth, west side, between South and Shippen, in Southwark. In the Northern Liberties, several in St. John's street, north of and near Polar Lane one in Cable Lane, east side, near Vine street.—U. S. Gazette.

HORSES.

The following remarks upon horses, are copied from the publication of an eminent farrier in Europe, and we think them worth the perusal of the farmers generally:

"The pulse of a horse in health, is from 36 to 40 beats in a minute, and may be easily felt by fixing the fingers gently upon the temporal artery, which is situated about an inch and a half backwards from the fore corner of the eye.

"Horses have not the faculty of puking or even belching wind out of their stomachs, and therefore are peculiarly subject to the wind colic.

"When a horse has been over ridden, bloody spots may be seen in the whites of his eyes.

"A limber dock is a sure sign of a limber back, that is, a weak one.

"A horse that is hardy and good for business, has a short back bone, which terminates forward of the hip bones.

"A decoction of white oak bark, will kill bots by tanning them, and they become so shrivelled as scarcely to be discernible when discharged.

"The principal signs of a good horse are these: The eyes set far apart in the head, and large and bright—the gurl high in the forehead, one or two in the neck is a good sign; the neck well set on, and high, the shoulder blades pretty high, and converging to a point, the breast full and large, and so also behind—the body round, for flat bodied or slab sided horses are weak natured, the dock stiff, going wide behind, for if the gambrels knock together, it shows that the horse is feeble; chewing the bit when provoked, is a good sign.

"It is a Spanish proverb that a dapple gray will sooner die than tire."

HORSES.

The two following items will be considered as worth the subscription price of this paper, by persons who have much to do with, and a proper feeling for horses.—*Am. Farmer.*

Loritto, Va Oct. 31, 1827.

DEAR SIR—The following extracts from a very popular scientific work now publishing in England, and called "The Library of Useful Knowledge," will save, I hope, many a poor horse from much suffering and injury. With this view I take the liberty to offer them for publication in your useful paper. Yours, with regard.

JAMES M. GARNETT.

Speaking of the eye-lids of birds, the writer remarks, "A third eye-lid of the same kind is found in the horse, and called the *haw*; it is moistened with a pulpy substance (or mucus) to take hold of the dust on the eye ball; and wipe it clean off, so that the eye is hardly ever seen with any thing upon it, though greatly exposed from its size and posture. The swiftness of the haw is given to it by a gristle, so as to drive out the haw with great velocity over the eye, and let it come back as quickly. Ignorant persons when this haw is inflamed from cold and swells so as to appear, which it never does in a healthy state, often mistake it for an imperfection, and cut it off: so nearly does ignorance produce the same mischief as cruelty!

"They might as well cut out the pupil of the eye, taking it for a black spot."

The other extract relates to the horse's hoof, and is as follows: "The bones of the foot are not placed directly under the weight; if they were in an upright position, they would make a firm pillar, and every motion would cause a shock. They are placed slanting, or oblique, and tied together by an elastic binding on their lower surfaces, so as to form springs as exact as those which we make of leather or steel for carriages. Then the flatness of the hoof which stretches out on each side, and the frog coming down in the middle between the quarters, adds greatly to the elasticity of the machine. Ignorant of this, ill-informed farmers nail the shoe too far back, fixing the quarters, and causing permanent contraction—so that the contracted hoof loses its elasticity; every step is a shock; inflammation and lameness ensue."

DRESSING,

The application of dung, or other manures, to soils, to increase their fruitfulness. Dressing differs from manuring in general, only as it is chiefly intended for the increasing of one single crop.—Not only are dressings necessary for poor and weak soils; but they are profitably applied to those which are rich and strong especially when seeds are sown which need much nourishment, or will make good return for it.

There are four things chiefly to be regarded in dressing; the suitability of the dressing to the soil, and to the crop; and the manner and the season of applying it.

To light, warm, or sandy soils, the coldest manure should be applied; such as the dung of hogs, cows, oxen, &c. Dung that is much mixed with straw does best in such a soil, and the straw soon rots and becomes food for plants. Cold and stiff soils should be dressed with the hottest and driest manures, as the dung of horses, sheep and fowls. Wet soils should have manures that have the greatest power of absorbing moisture.—Lime, where it is cheap and plenty, may be used with great advantage; ashes, coals, and saw dust are also very proper.

Some kinds of dressing should be well mixed with the soil, by the plough and harrow; especially such as are apt to lose their strength, by being exposed to the air. Of this sort are dungs in general, and some other manures.—Dung is to be ploughed in with a light furrow. Composts, which consist of dung, earth and other substances, need only to be harrowed. If dressings are laid too deep, as under deep furrows, they will be in a manner lost; the roots of most kinds of annual plants will scarcely reach them: and, before the next ploughing, the strength of them will be sunk still deeper into the earth.

There are other manures which should be used only as top dressings. Their exposure to the air takes away little or none of their virtue, being of an alkaline nature, such as ashes, lime, and the like. They are speedily settled into the soil by rains and melting snows, and afford a more kindly nourishment to the roots of grass and grain, than if they were buried in the soil. Being laid lower than the surface, their strength would be more apt to be carried lower than the roots of plants commonly reach.

Some dressings are thought to be more successfully applied some time before sowing. Such a one

line is said to be, as being apt to burn, or too much heat the seed. But this, I think, can be only when it is laid on unslacked, and in large quantities.

Other dressings answer best at the time of sowing. This is the case as to most kinds of dung that are used, and of several other manures.

But those manures which exert all their strength suddenly, are allowed to be best used only as top dressings, after the plants are up, such as soot, ashes, certain warm composts, and malt dust. If they are laid on winter grain in autumn, there will be danger of their causing too rapid a growth: in consequence of which, the grain will be afterwards stunted, and languish, unless another and larger dressing be given it in the following spring, or summer. It is probably best to apply these dressings just before the time when the plants will need the greatest supply of vegetable nourishment, which is when their growth is most rapid, or near the time when the ears are shooting out.

[Deane's N. E. Farmer.

ADVICE OF A PARENT.

[The following article, copied from the *Daily Advertiser*, would have done honor to the pen of Franklin.—Every line and letter of it ought to be carefully perused by every young man, and treasured in his heart.]

The following are instructions given by the Father to his Son, on his going to serve as an apprentice in a merchandise house.

"I shall confine myself at present, to a few remarks only, respecting the relative situation between yourself and master:

1. You are to give your constant attendance at the counting room or store (business or no business) during office hours, except you are sent out by Mr S. or go by his permission.
 2. When out on business finish it with despatch, and return immediately.
 3. Keep your store in the most regular and neatest order, especially your desks, books and files of papers.
 4. Whatever business you may have on hand, execute it, not in a hurry, but in the best style, instantly, without delay. "Procrastination is the thief of time."
 5. Whenever you deliver an article see that it be charged the very first thing you do. It will require your utmost attention and consideration to enable you to execute your duties faithfully and correctly, especially till practice makes business familiar.
 6. The last and most important, you are involuntarily to keep your master's secrets, relate none of his business, not even to your most intimate friend. A breach of this injunction would be treason on your part, and the reason will be obvious to you. Mr S. will cheerfully grant you every indulgence. Should you want to be absent an hour, or even more, he will not object; but you must be careful never to ask these favors, when your presence is necessary in the store. Think it not derogatory to perform any work amongst the goods in the store; the exercise will be useful to strengthen your muscles and preserve your health. Be careful to improve your hand writing, by copying in the best style; and when you write a letter, you should do it, as if it was to be inspected by all your acquaintance, and you should never write fast.
- I suspect this pen, ink, and paper is thrown away, for I believe your good sense would point you to the path of duty and rectitude in all cases.

Your most affectionate FATHER.

Windows let out the Heat.—In the progress of improvement, and the increasing disposition for light, modern builders have so enlarged and multiplied the windows of our houses, that while they let in light enough to spoil our eyes, they let out heat enough to freeze our whole bodies, or otherwise drain our purses empty to supply us with fuel. Glass is a free conductor of heat, as any one may be sensible by applying his hand to the window on a cold winter's day, when he will find the warmth rapidly departing. More heat, probably, escapes from well finished rooms, through the glass of the windows, than by all other outlets put together. If this be true, both our comfort and our interest might be promoted, by the use of close shutters, with which one half of the windows of our houses might be closed during the daylight, in winter, (the other half being sufficient to admit all necessary light) and all of them in the evening. We should be glad to have this subject examined both by scientific and practical men; and at the same time we would recommend it to the serious consideration of those who buy their wood, and to whom the saving of heat would be the saving of money.—Berkshire American.

Hide-bound.—Horses often become hide-bound when they are poorly kept, and badly used. In this case the animal grows poor, his skin sticks to his ribs, and small boils break out on his back. A method of treatment opposite to that which the horse has received will generally restore him;—that is, keep and feed him well, work him moderately, and loosen his skin by oiling it, and using the curry-comb frequently, but not too harshly.

Entomology.—There is in Livonia a rare insect, which is met with only in the most northern countries, and the very existence of which has for a long time been doubted. It is the *fauna infernalis*, described by Linnæus in the new *Memoirs* of the Academy of Upsal. This insect is so small, that it is very difficult to distinguish it with the naked eye. In warm weather, it falls upon persons from the air, and its bite produces a swelling which becomes mortal, unless prompt remedies be applied. During the hay-harvest, other insects, called *negligar*, are equally injurious to men and beasts. They are of the size of a grain of sand. At sunset they appear in great numbers, descend in a perpendicular line, pierce the strongest linen, and cause an itching with pustules which become dangerous if scratched. They occasion swelling in the throats of cattle which inhale them, and die unless speedily assisted. The cure consists in a fumigation of flax, producing a violent cough.—*Literary Gaz.*

Gen. Ashley has had a third return of furs from the Rocky Mountains, more valuable than either that preceded it, probably worth 60 or 70,000 dollars. The party which conducted it arrived at St Louis the 15th September, having safely escaped all the perils and casualties to which their extensive operations were subject.

Method of destroying Moles in Meadows or Gardens.—Collect earth worms, kill them, and mix them up with the powder of nux vomica. After the mixture has remained in a heap twenty-four hours, take the worms and place one or two here and there in the holes and routes of the moles. The desired effect is said to be the certain result.

Bul. Un.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, NOV. 23, 1837.

REMARKS ON THE IMPROVEMENT OF LIVE STOCK.

[Continued from page 131.]

The author of the pamphlet before us in treating of sheep, speaks very highly of the Dishley, or improved Leicester breed, and of the Southdowns; both of which have been introduced into this country by the patriotic exertions of Colonel Powell, and other public spirited cultivators. He remarks that "the forms of the Spanish sheep, are according to the British ideas of figure defective; but the judicious system of breeding and selection pursued with the anglo-merinos, has brought them to a very high degree of excellence. In the improvement of fleece, the introduction of the Southdowns, (and also Ryelands, with both of which lord Somerville crossed the Spaniards, and thought them equally good,) might be attended with favorable consequences. They are the best of the British short woolled sheep—their mutton is also of a very fine grain and excellent flavor, although not so large as the Dishley; the average wether weights at two years old, being about 18 pounds per quarter; but specimens have been fed to enormous weight. Mr. Coke of Holkham, Norfolk, having produced at one of lord Somerville's shows, a two shear wether, that weighed forty pounds per quarter.

"There are few situations in which they will not thrive; they are hardy, and will bear the greatest cold, if unaccompanied with moisture—are quiet and healthy—quick feeders, with good fleece and produce good weight.

"To produce improvement in the fleece, has called forth the talents of many well informed men. By one, whose abilities stand in the highest order, the following judicious remarks are laid down.

"The wool grower is counselled to place no dependence on accidental and external circumstances for the production of good fleeces, but to rely entirely, and with confidence, upon the proportions with which nature has endowed his sheep. The perpetuity of animal properties being scarcely any where more strikingly exhibited, than in the certainty and regularity with which the parent sheep convey to their offspring their own distinguishing characteristics. Breeds is of the utmost consequence. It is the basis upon which all improvements of the flesh are founded, the only source of hope that attempts to produce fine wool, will be followed with success."

"The shepherd ought not unnecessarily to expose his flock to extremes of heat and cold, nor to any capricious changes. The bad effects of water on the pile, while growing, may be owing to the readiness with which it mixes with the yolk, and carries off a quantity of that animal soap, which is so necessary to the good quality and even existence of the fleece; for if care be taken to prevent this, by the skilful application of tar mingled with butter, which acts as repellents to the water, the lower part of the staple, which grew after the mixture was applied, contains a sufficient quantity of rich and sufficient yolk, and is of a much superior sort of wool to those parts of the pile, which have been exposed without protection, to the dripping wetness of the winter season.

"Perfect whiteness is eminently desirable in all

kinds of wool, and all varieties of color in breeding are to be avoided, and all artificial tinges with ruddle, or ochres, or any such substance, which is injurious to the pile for the dyer's purpose.

"Amongst the general rules for managing sheep, it is said that they require drink when at straw, or dry food of any kind, if it be grass dried up by the dog-day heats. They should not be turned into pasture in the autumn or winter, until heavy dews or hoar frost be exhaled, which frequently does not happen till late in the day, and sometimes not at all. In this way sheep are immensely injured, and great mortality ensues; the great quantities of chilling and unwholesome water, which the animals take into their stomachs, induce fluent colic, diarrhoea, or scouring, and intermittents, ending in a general waste or consumption. The only palliative remedy, where no means exist of supporting sheep, but by this exposure, is to allow them hay in the morning, or to fill them with straw.

"The shorter and finer the grass, the fitter for sheep, yet there is no pasture so good or so fine, but with continued use sheep will become weary of it. Hard stocking with sheep, will render the coarser grass fine—a most useful memento in many situations. It has, however, concomitant disadvantages, by impregnating the soil with the rank manure and urine of the flocks, which causes them to loathe it, and even affects the young grass produced by the superabundant manure.—Before the bad effects take place, the pasture should be changed both on account of the sheep and the soil.

"Wet unsound fallow, and lands which have been flooded, rot sheep; it is said, in some places, that the lute stone land has the same effect. We find it recommended in the Bath papers, to fold sheep before the dew falls, in places subject to rot, and keep them till it exhales, spring and summer.

"No ewe ever rots whilst she has a lamb by her side; place sheep that have the rot, where they can get at the bark and young shoots of elder."*

This author, likewise treats of the management of swine; and says, "the varieties of swine necessary for our purpose, are very limited, and may be classed, in the larger breeds for the supply of our navigation, lumbermen, and other commercial purposes, and the smaller breed as *parking* stores for family use.

"For the former purpose, the breeds of Berks and Hampshire will be found admirably calculated; their character, throughout England, is in great repute. There are larger breeds to be found than either, but none possessing better qualities; in their forms, they have great depth of carcase, breadth of chest and loins, and proportionate length, with good gammons and fine legs; have large pendulous ears, are *quickly fed and brought to proof*. No little difference is there made between the Hants and Berkshire hogs, that dealers at Smithfield are indifferent which to choose.

"Of the smaller breeds for pork for family sup-

*The rot in sheep is similar to a pulmonary consumption in man. The following receipt for that disease is from Young's Annals, Vol. XIII, p. 232. "Give to each sheep one spoonful of Spirit of Turpentine, mixed with two of water, after fasting twelve hours—in them have three doses, sleeping six days between each dose; this is said to have been used with success, even in cases where the fleece has been nearly gone, and the throat terribly swelled." The *Farmers' Assistant* observes, "whether correct or not, we cannot say; that, sheep in Great Britain are subject to the rot; but it is believed that this disease has never been known in this country."—Ed. A. E. Farmer.

ply, the Chinese are in the greatest estimation—and also their cross with the Oxford dairies, for delicacy of meat, fineness of form, and quickness of proof, they stand unrivalled."

We perceive that our author has taken a side in a question which has been much controverted, relative to breeding animals from the same family. He says, [page 5,] "Breeding is and is not—from the most perfect animal, *however closely allied*, will be found far more advantageous than changing and crossing animals remote from each other, in the peculiar characters of breed which too frequently produces stock scarcely worth raising."

This doctrine, though once generally believed in and practised upon, is now we believe as generally exploded. Sir John Sinclair says "Though this plan [*breeding in and in*] was for some time in fashion, under the sanction of Bakewell's authority, yet experience has now proved that it cannot be successfully persevered in. It may prove beneficial indeed, if not carried too far, in fixing any variety that may be thought valuable, but on the whole it is so only in appearance. Under this system the young animal comes into the world, on comparatively, a very small scale. By keeping it fat from the first moment of its existence, it is made to attain a greater size than nature intended; and its weight in consequence will be very great, in proportion to the size of its bones. Thus a generation or two of animals of an extraordinary form, and saleable at enormous prices, may be obtained; but that does not prove that the practice is eligible, if long persisted in. On the contrary if the system be followed up, the stock get tender and delicate, they become bad feeders; and though they retain their shape and beauty, they will decrease in vigor and activity, will become lean and dwarfish, and ultimately incapable of continuing the race. The instances of this are numerous. The celebrated breeder Princeps, found that decrease of size unavoidable, in spite of all his endeavors, by keeping his young stock well to prevent it. Sir John Sebright tried many experiments by *breeding in and in* with dogs, fowls, and pigeons, and found the breeds uniformly degenerate. A gentleman who tried the system with pigs, brought them at last into such a state that the females gave over breeding entirely, and when they did breed their produce was so small and delicate that they died as soon as they were born. Nay, Mr Knight's experiments with plants have fully convinced him, that in the vegetable as well as in the animal kingdom, the offspring of a male and female, not related will possess more strength and vigour, than where they are both of the same family. This proves how unprofitable such connexions are. That is no reason, however, why a breeder may not manage a particular family of animals to advantage, by shifting or changing, instead of breeding directly from parents to offspring.

"The breeding from different families of the same race is therefore a preferable system.—When these have been for some time established in different situations, and have had some slight shades of difference impressed upon them by the influence of different climates, soils and treatment, it is found advantageous to interchange the males

"Long experience has proved the old notion of the necessity of crossing, or changing the species of animals in order to prevent degeneration is totally groundless. You may breed *in and in*, and from the *nearest affinity of blood* with the utmost success, provided you select with judgement the best shaped individuals.—General Trueman

for the purpose of strengthening the excellencies and remedying the defects of each family. On this principle the celebrated Culley continued for many years, to hire his rams from Bakewell, at the very time that other breeders were paying him a liberal price for his own; and the very same practice is followed by the most skillful breeders at present."

If, however, the author of the pamphlet, which it is the object of this article to recommend, has given an erroneous view of this controverted point, the general merits of the work more than compensate for the defect. We are glad to perceive by this and other evidence that the British colonies in North America are properly attentive to the all important interests of agriculture; and hope that they, with their neighbors of the United States, may always be found in amity; and advancing hand in hand in the path of national improvement.

POULTRY.

Fowls of every sort may be profitably fed on boiled potatoes and meal mixed. Hens which do not lay in the winter should have access to slacked lime, pounded bones, oyster shells, or other matter, which contains lime in some of its compounds, because something of the kind is necessary to form the shells of their eggs, which are composed of the phosphate of lime.

PEAT ASHES FOR MANURE.

A gentleman who is fond of agricultural pursuits, wishes for information relative to the value of peat-ashes for manure. We have had no experience on this subject, but will quote some written authorities, which we believe may be relied on.

Deane's New England Farmer, under the article *Peat*, states that "It has been found by trials that the ashes of peat is a very important manure, of three times the value of wood ashes. Fifteen bushels are allowed to be a sufficient top-dressing for an acre. It is an excellent manure for cold grass lands; and for all such crops in any soil as require much heat. They should be sowed by hand, as they can thus be more evenly spread. It may be done in winter with the least danger of hurting plants by its heat. If sown in summer it should be just before a rain, when it would be deprived of its burning quality. The ashes are said to have a better effect on winter than on summer grain; and to be not good for leguminous plants, as it makes their haulm too luxuriant. The good effects of a dressing will be visible for three years, and they do not leave land in an impoverished state."

Sir Humphrey Davy says "Peat ashes are used as a top dressing for cultivated grasses, particularly sainfoin and clover. In examining the ashes of sainfoin, clover, and rye grass, I found that they afforded considerable quantities of gypsum; and this substance probably as intimately combined as a necessary part of their woody fibre." We find that peat ashes are very commonly used in Great Britain for manure, but have not heard of their being applied to that purpose in the United States. We should be very happy to gain information from our agricultural friends on this topic, which appears to us important; as peat is much used for fuel in some parts of New England. We should likewise be glad to learn whether the ashes of Lehigh coal, or other mineral coal can be usefully employed as a manure.

ILLEGITIMATE PLANTS.

In Ray's History of Plants, we have the following anecdote. One Richard Baal, a gardener at Brentford, sold a great quantity of cauliflower seed, which he raised in his own garden, to several gardeners in the suburbs of London, who carefully sowed the seed in good ground, but they produced nothing but the common long leaved cabbage; for which reason they complained that they were imposed upon, and commenced a suit against the aforesaid Baal, in Westminster-hall. The Judge's opinion was, that Baal must return the gardeners their money, and also make good their loss of time and crops. This cheat we ought not to lay to the poor gardener's charge, for it is wholly to be ascribed to his good plants being impregnated by the common cabbage. Therefore, if any one has an excellent sort of cabbage, he ought not to let it flower in the same bed with any other of an inferior sort; lest the good sort should be impregnated with the dust of the other, and the seeds produce a degenerate race. Indeed the same precautions are necessary in procuring the seeds of other vegetables; as most or all of them may be altered by plants going to seed not far from them, which are near akin to them.

We are informed that a singular trial took place at the late term of the Superior Court in Burke county.

A man who is estimated to be worth two hundred thousand dollars, was indicted for the crime of forgery, and so conclusive was the evidence, that the Jury convicted him. What is still more remarkable, the amount which this individual who has thus made shipwreck of his reputation, expected to gain, was only thirty dollars!! He has appealed to the Supreme Court.—*Raleigh paper.*

Schuylkill Coal is in so great a demand, that it appears probable it will this year exceed the supply, although an addition of 1000 tons per week may be looked for, until the ice closes the navigation. There has been an order executed for two hundred tons of this Coal, shipped for the Havana; this new source of demand, for boiling the sugar cane, may be likely greatly to increase the consumption of *Schuylkill Coal*, and become beneficial to the planters of the West Indies, as well as to our Southern States, where sugar will be made to a considerable extent.—*Phil. Gaz.*

According to a recent and minute statement, there are in Massachusetts, one hundred and fifty incorporated Woollen and Cotton Manufactories; with an aggregate capital exceeding twenty millions of dollars.

Bremen Geese.

For sale, 3 pair of this superior breed of Geese: they are decidedly superior to the common breed, in the great size they attain, in the facility with which they may be raised, and in the comparatively small quantity of grain required to fatten them.—Inquire at this office.

J. Mahon's Gardener.

Just received at the New England Farmer office, a further supply of M. Mahon's American Gardener. This work is the most elaborate of the kind ever published in this country, comprising ample directions for the management of the kitchen garden, fruit garden, orchard, vineyard, nursery, pleasure ground, flower garden, green house, hot house, and forcing frames, for every month in the year.

This day published by Richardson & Lord, at their town and country bookstore, the *Old Farmer's Almanack* for 1828, by R. B. Thomas, Esq. containing the usual quantity of new, useful, and entertaining matter, together with the sun's declination. Country traders supplied by R. & L. at the lowest rate. In the press, and will soon be published, the *Miniature or Pocket Almanack*, likewise the *Massachusetts Register* for 1828.

JAMES BLOODGOOD & Co's.
Nursery, at Flushing, on Long-Island near New York.

In behalf of the proprietors of the above nursery, the subscriber officiates the orders of Horticulturists who may be desirous of stocking their gardens and fields with fruit-trees of the finest sorts and most healthy and vigorous stocks at the present autumn. Bloodgood & Co. attend personally to the incultivation and grafting of all their fruit trees, and purchasers may rely with confidence that the trees they order will prove genuine. The subscriber, agent of the above nursery, will receive orders for any quantity of

FRUIT AND FOREST TREES, FLOWERING SHRUBS, AND PLANTS.

And the trees will be delivered in this city at the risk and expense of the Purchaser; the hills may be paid to him.

The reputation of this nursery is so extensively known and has been so well sustained that I take leave to inform you it is want of trees to any of the Horticulturists in this city and its vicinity, and if ocular demonstration is desired, I invite those who wish to be thus satisfied to examine the trees in my garden at Dorchester, procured from this nursery for three or four years past, some of which are now in bearing, all in a healthy and vigorous state.

Catalogues will be delivered gratis on application to ZEB COOK, Jr. Rogers' Building, Congress-Street.

Agricultural Books.

Just received for sale at the office of the New England Farmer, a further supply of standard agricultural books, among which are, *London's Encyclopedia of Agriculture*

Marshall on the Knowledge and Practice of Gardening

MISCELLANIES.

Brighton New Church.—The following (says a London paper) are the names of the trees planted in St Peter's Church Yard, with their symbolical descriptions:—

Cedar of Lebanon.—It being the tree selected by Solomon for building the temple of Jerusalem.

Weeping Willow.—A native of Babylon, and the tree on which the unhappy Israelites hung their harps when they bemoaned the loss of Jerusalem.

Sycamore.—The tree on which Zacheus climbed to see Christ on his way to Jerusalem.

Thorn.—To remind us of the crown of thorns.

Aspen.—It being the tree of which the cross is said to have been formed.

Lime.—The principal papyraceous tree of the ancients, and on the bark of which the Scriptures were probably first written.

Ash.—Esteemed a sacred tree in ancient times, and the one to which the Serpent is said to have a strong antipathy.

Plane.—The favorite tree of the Greeks, and under whose shade the Athenian philosophers retired to study.

Birch.—The tree from which the Lictors made their fasces.

Elm.—The funeral tree of the Romans, and the coffin timber of Britons.

Cypress. The funeral tree of all Eastern nations.

Yew.—“The sacred Yew, so fear'd in war,” and a tree consecrated and dedicated to the grave.

Ahor Vita.—Although the tree of life, it shows that immortality is not the lot of any thing terrestrial.

Holley.—As being used in the decoration of churches at sacred festivals.

Box.—The plant formerly used in the feast of the Purification of the Blessed Virgin.

Poplar.—A plant held sacred by the Romans, and the tree used to mark the boundaries of their lands.

Apple.—The tree of which the bowl of hospitality was formed in the days of yore.

Pine.—“And the tall pine for future natives.”

—Da mille lignum
Navigis pinus.

“The useful pine for ships.”

“To thee I consecrate the pine.” In Pagan days it was consecrated to Piana.

Bay.—The Laurus Nobilis of the ancient warriors; the crown of our poet Laureates; a supposed protection from lightning, and a purifier of pestilential air.

Laurel.—As an honorable badge for those who bravely defend their country and their laws.

Oak.—Once the refuge of a British Monarch, and ever the bulwark of our State.

Cheapness of Newspapers.—It is not perhaps generally known, says the Newburyport Herald, that the quantity of printed matter contained in a newspaper is much more than can be obtained in any other way for the same price. The editor of the Vermont Chronicle in answer to a complaint of the extra-ut price of his paper by a person who was solicited to subscribe, makes the following calculations, which will serve to show to all, who are ignorant of the fact, the very low price at which newspapers are usually put.

“We went to our shelves and took down a volume published in London, price, in boards, \$2 50, and on making an estimate, found that our paper for a year contains as much as nine such volumes,

worth, at \$2 50 each, \$22 50! It startled us: can it be, we thought, that our paper is so very low? We took a volume, in boards, published in Boston, and having made a similar comparison, found that, making the letter press, or reading matter of that volume, our guide, we ought to charge for the Chronicle \$12 50 a year! But perhaps periodical pamphlets come cheaper. Here then is the American Journal of Education, an excellent work, and nobody complains of its price. Judging by that, as above, the advance price for our paper should be \$10,00; and taking the National Preacher even for our guide, it should be \$9,00! We will apply one other test, the severest in our power. We have on our desk the little Tract, “Improvement in Farming,”—we recommend it, by the way, to our agricultural friends; they ought all to read it—published by the American Tract Society, and therefore sold, as every body knows, at a price proverbially low. Yet in order to make the same amount of letter press as dear in our paper as in the publications of that Society, we ought to charge \$2 28 in advance! and yet fault is found with us for asking \$72 at the end of the year.

Superstition.—A southern paper, after noticing a dangerous wound received by a man, in sliding from a hay mow on a pitchfork, states, “that medicinal preparations were applied to the pitchfork and it has been carefully wrapped up and deposited in flannel, to aid in healing of the wound! This method of cure was quite fashionable about two hundred years ago, and medical writers say it was attended with great advantages; for while the surgeon exhausted his skill on the instrument, dame nature, more skillful, healed the wound.”

A species of sea weed has recently been brought into use in Germany for stuffing cushions and mattresses. “It is said to be capable of resisting humidity altogether, and that it will not harbour any infections or contagious matter. No vermin will live in it. Some of the prisons and public establishments have already adopted it. This material is found in the north of Germany, and has been first applied to this use by Mr Warburg, a merchant of that country. If it answers the description, the discovery will be a most valuable one.”

In your discourse be cautious what you speak, and to whom you speak—how you speak, and when you speak—and what you speak, speak wisely, speak truly.

The country south of the Tagus is, with the exception of that part of it nearest the river, chiefly covered with oak and cork trees; and the underwood, for many leagues together, is composed of gum-cistus. It is with this shrub that the bakers at Estremous, and throughout the Alentejo, heat their ovens; and the smell of it which every where prevails, is truly delightful; although to some strangers it is at first very overpowering.

Apples I never saw of so large a size, or of such excellent flavor as those of Montour or Novo in the Alentejo. This town is remarkable for the immense quantities of apples and quinces, which abound in the whole of its neighborhood, and of these fruit trees the hedges are formed; the species of the former called *ben postis* are of deserved celebrity.

Moss Roses.—A few leagues from Bevers, in a north west direction is a small village called Alcovas de Roses, from the quantities of beautiful

moss roses growing wild about its hedges in every direction. They are as numerous as the blackberries in our own hedge rows.

Superb Bulbous Flower Roots.

Just received at the office of the New England Farmer, direct from the most eminent florists in Holland, a large assortment of bulbous flower roots, comprising the finest varieties of Hyacinths, Tulips, (bulbous, parrot, early and double) Double Ranunculus, Anarrhis, Mexican Tiger Flower, Double Tuberoses, Double Snowdrops, Peonies, (Chinese crimson, double rose coloured, and double white fringed) Neapolitan Star of Bethlehem (white and blue) Polyanthus Narcissus (white and yellow) Easter Narcissus, Spanish Bulbous Iris, Lilies (of various sorts) Fritillaries, various sorts of Crocus, &c. &c. Also, Bulb Gossams and Crocus plants in the shape of hedgehogs, beehives, flower baskets, &c. (a new article.)—Catalogues of the whole may be seen at the office.

Purchasers may rely on the excellence of the above, as they were not purchased at auction, but are supported direct from the first florists in Holland, and are remarkable for their size, beauty or delicacy of tint.—They have been examined by persons acquainted with the nature of bulbs, and pronounced of a very superior quality.

Also, on consignment, one cask of fine London split peas, by the quart or bushel, for culinary purposes; pulverized celery seed for soups.

Fruit Trees.

W. L. PRINCE, the proprietor of the *Linnean Botanic Garden and Nursery* at Fushing, L. has the pleasure of informing the public, that his nursery now contains 172 varieties of the Apple, 202 of Peas, 26 of Cherries, 139 of Plums, 25 of Apricots, 84 of Peaches, 20 of Nectarines, 10 of Almonds, 14 of Mulberries, 6 of Quinces, 16 of Figs, 16 of Currants, 15 of Raspberries, 47 of Gooseberries, 30 of Strawberries, 257 of Grapes, 600 of Ornamental and other Fruit Trees, and a remarkable variety of their size, beauty or delicacy of tint.—Catalogues may be obtained at the New England Farmer office, gratis, and orders left there or sent by mail, will meet attention.

The different varieties cannot be otherwise than genuine, as the greatest attention is paid, and nearly all the kinds are inoculated from bearing trees. The Cherry, Peach, and other trees are generally of large size. Catalogues may be obtained at the New England Farmer office, gratis, and orders left there or sent by mail, will meet attention.

Trees, Ornamental Shrubs, &c.

MR. WINSLOW offers for sale at his Nursery, in Brighton, the largest variety of Fruit and Ornamental Trees, Shrubs, &c. His collection of Fruit Trees is large and well selected; and his variety of Ornamental Shrubs is very extensive, comprising the Rose Acazia, Three thorned Acazia, Gum Acazia, double flowering Almonds, red and white Aithia, Bladder nut tree, Bigonia Radicum, Burning Bush, dwarf flowering Horse Chestnut, splendid flowering Catalpas, Bellinas, Papine, Pinks, Maracron, finest flowering shrubby variety of Camellia, variety of Iron-wood, English walnuts, Weeping willows, Quinces, Syringos, Laburnum, Snowballs, Rhodora, Raspberries, Plums, Pecan nut trees, Mountain Ash, Lillies, Larks, or grandiflora Japan pear, Japonica chorberris, &c.—Orders for any of these articles left with Mr Winslow, at the New England Farmer office, will be executed on the same terms as at the nursery, and delivered in Boston, free of expense.—Catalogues furnished gratis.

New England Farmer's Almanack, for 1828.—Just published, at the New England Farmer Office, and for sale by BOWLES & DEARNEY, 72 Washington Street, and at the Bookstores generally, the *New England Farmer's Almanack*, for 1828. By Thomas G. Fessenden, Editor of the New England Farmer.

Gooseberry Bushes.

Persons in want of superior varieties of Gooseberries, can procure the bushes, by sending their orders to the office of the New England Farmer. They are from Glasgow in Scotland; the fruit is fine flavoured and large, (some may be seen at this office measuring 3 and 4 inches in circumference) and of white, red, and yellow colour. The price will be $\$4$ per dozen.

500 Grape Vines.

For sale in Charlestown, by Samuel R. Johnson. The above choice vines are of the *Sirex rubra* species, all raised from cuttings, and are from 3 to 4 years old, most of them in a bearing state. Orders for the above may be supplied at J. R. Newell's Agricultural Establishment, No. 52 North Market street, or by the subscriber in Charlestown; price for each vine is ten-twenty-five to fifty cents, according to its age and size; all the above vines have been trained in trellises, and insured to be as healthy vines as can be procured.—S. H. ELI, R. JOHNSON.

Parter Wanted.

An active and business like man, of unimpeachable integrity, is wanted to take a share in an Agricultural and Horticultural speculation, which promises the most profitable results without risk. A capital of \$400 will be necessary. For particulars, apply by letter, (post paid) to Mr. ISAAC WINSLOW, Merchant, Boston.

THE FARMER is published every Friday, at \$3.00 per annum, or \$2.50 if paid in advance. Gentlemen who procure five responsible subscribers, are entitled to a sixth volume gratis.

AGRICULTURE.

TO OUR READERS OF THE NEW ENGLAND FARMER.

ROSES.

Johnson's Garden, Flushing, near New York, Nov. 19, 1827.

T. G. PRESSIDEN, Esq.—In perusing the European publications of recent date you have without doubt perceived that among the number of beautiful new Roses which have been introduced from China and India, and the hybrids which have been produced from them, the Rosa Grevilleii or Greville Rose has been particularly noticed for its remarkable properties. Some cursory remarks were made a few months since in our public papers relative to this Rose; but probably no better description could be given than to quote the statements published in London's Gardeners' Magazine, and in the Transactions of the London Horticultural Society. In the 11th No. of London's Magazine, page 47, the following description is given in a letter from a gentleman to the Editor: "You will no doubt recollect the shoot I showed you of my Greville Rose, which grew eighteen feet in a few weeks. It is now in bloom and is the most singular curiosity of all the Rose tribe that has come under my observation. It grows on an E. by N. aspect, on the gable end of my house, covering above 150 feet square, with more than a hundred trusses of bloom. Some of them have more than fifty buds in a cluster and the whole will average about thirty in a truss, so that the amount of flower buds is little short of 3000. But the most astonishing curiosity is the variety of colours produced on the buds at first opening, white, light blush, deeper blush, light red, darker red and purple, all on the same clusters." In the report of the Horticultural Society of London, for the month of June 1826, the following remarks are made: "Rosa Grevilleii in a single fasciculus of flowers are roses of every shade of purple and from white to the darkest tint; it is one of the handsomest of climbing roses."

After these statements any further description from me is deemed unnecessary, and I will merely remark that it is the strongest rose in its growth, and the most rapid in the formation of long vigorous shoots that I have ever seen, and will very speedily cover a large space. I have succeeded during the past season in rearing about 150 young vigorous plants, one half of which have already been disseminated throughout the Union. The present collection of Roses of all the different kinds cultivated at this establishment, exceeds six hundred varieties, about 500 of which are enumerated in the catalogues, the others having been received since their publication. In this number are included about 100 varieties of Chinese and India roses and their hybrids.

The whole are regularly labelled agreeably to the catalogue, which affords to the amateur at the time of their flowering, an opportunity of contrasting their comparative beauties, and at that period most forcibly brings to mind the poetical descriptions of what is termed in oriental climes, "The Feast of Roses." Yours, most respectfully,
W. M. PRINCE.

FOOT ROT IN SHEEP.

The following letter was directed to a gentleman who has frequently laid us under obligations for useful articles, to be inserted in the New England Farmer and by him sent to us for publication.

DEAR SIR.—As the now and rapidly extending disease, called the Foot Rot, which was introduced among our sheep by those recently imported from Saxony, has bid defiance to the efforts of the Farmer to eradicate it—I enclose an account of the mode of treating this fatal disorder, in Great Britain, which I recently noticed in the New Monthly Magazine of 1820.

Having shown it to a gentleman, whose Merino sheep had caught the complaint from a few of the Devon breed, which were purchased in 1825, he observed, that some experiments had been made upon them, by *paring the hoof* and applying the vitriol during last summer, with favorable results. It was found that necrid ulcers, often containing maggots, were concealed under the hoof, and he therefore had confidence in the English remedy, and should apply it to his flock. He recommends that the hoof should be thoroughly cut away, so as to entirely expose the ulcers, and when washed clean with strong soap suds, the "drying wash" to be applied.

The feet of the sheep, which are lame, should be often examined, and the knife and liquid freely applied, and there is little doubt the disorder can thus be cured. The diseased sheep should be separated from those that are healthy. H. A.

Foot Rot in Sheep.

"In the report of the Merino flock of the earl of Lismore, by the Rev. Thomas Russell" it is remarked, that "the flock is almost wholly free from lameness; and that this is principally owing to *frequently paring the hoofs*." The drying wash used by the shepherd, when needful, is thus composed:—take blue vitriol, white vitriol, rock or roche alum, and verdigris, of each three ounces: rub them together in a mortar, and add one quart of scalding vinegar; stir it well, and cover it down to cool—then add half a pint of spirits of turpentine, and half a pint of spirits of wine, and cork it up in a clean stone bottle. It is a good wash for pinches and recent bruises, and all incipient inflammations."—*Eng. V.M. M. for 1820.*

THE LOCUST.

A writer in the American Farmer gives the following account of his manner of raising this useful tree:—"I had procured a quantity of the Locust seeds, (Black Locust, so called,) with the intention of planting them early last spring. The backwardness of the season prevented my doing so at the time intended, and my numerous avocations thereafter caused me to forget that those seeds were in my possession, until the 18th of June, when late as it was, I determined to experiment with them. According to the directions given in the letter referred to, I poured boiling water on the seeds, and suffered them to remain in the same water for twelve or fourteen hours, throwing away the few light seeds that rose to the surface thereof. My gardener, (a soldier of

the revolution) had previously prepared a bed for the reception of the seeds, and of the morning of the 18th of June, he drilled them in, four or five inches apart—covering them lightly—the rows about a foot apart; every seed, I think, vegetated. In a few days they appeared above ground, and so rapid a growth of trees I never before saw.—On the 23d of August following, I counted 500 vigorous young trees, some of which measured in height twenty-six inches, and not any of them short of twenty inches. There was great uniformity in the size of the trees. I have only to add, that a small quantity of refuse mortar which had been prepared early in the spring for plastering a house, had been strowed upon the bed in which the Locust seeds were drilled."

HOUSES OF SOUTH AMERICA.

Among the means of increasing the national wealth of the South American States, it was always considered that the sale of cattle and horses would produce a valuable income. The horses, however, seem to be worth nothing. An officer of the Navy writes to the Editor of the American Farmer—"I am confident that there is not a horse or mare in Chili or Peru that would sell for one hundred dollars. I have not seen one which could, if in the United States, bring sixty dollars. I have bought a saddle horse from Mendoza, one of the handsomest that I have seen here, and given ten doubloons for him, which is the highest price given; but really in Maryland he would not sell for sixty dollars and his horse has been brought over the Cordilleras to Valparaiso 400 miles, and from thence here by water, from 12 to 15 days' sail."

SILK.

The Editor of the Pennsylvania Village Record, has seen specimens of Sewing Silk made by the daughters of Jas. Woolston, Esq. They made, from about 500 worms, 100 skeins. For evenness of thread, and delicacy of colouring, it would bear a favorable comparison with Italian or French silk. Some have supposed that feeding the silk worms could not be profitable, until intricate machinery and rare skill in the manufacture of silk goods, should be introduced here. It is not so near a million of dollars a year of the article, in the simple form of sewing silk, as easily made as shoe thread, is annually imported. As to the rest, if the raw material be produced abundantly, manufactories will rise up of course. The editor has still a thousand or two of the Italian mulberry to give away. They are not large, being of this year's growth, and can be taken in a handkerchief. A hundred will be given to each person sending. The roots are fine and vigorous. Application should be made within two weeks, if possible, at his garden, at Springville, a mile below, West Chester, Pa.—*Baltimore Patriot.*

FISH FOOD FOR COWS.

The Medical Intelligence states, that about fifty cows live principally on fresh fish, at Provincetown, Cape Cod, Mass. The town is a body of sand, containing no vegetable but a little beach grass, which partially serves in some places to form a surface sufficiently firm to prevent its being

blown away or changed with every strong wind like a stifling sandbar at the mouth of a river. The houses are set on piles, that the wind and sand may pass under them, instead of covering them. The inhabitants of the place live by taking fish; many boats come in daily, when the weather permits, and dress their fish on the shore. The cows come, after cropping what little grass the place affords, to finish their dinner on animal food. They devour the heads, back-bones and offals of the fish, without leaving a particle behind for the cats or crows. Notwithstanding this convenient diet for their cows, it is said the proprietors of Provincetown must abandon the privilege of keeping them, on account of their destroying the grass, which is so useful in giving the bipeds something like a solid surface to live on.—*Visit. and Tel.*

Extracts from "An Address to the Society of the Counties of Hampshire, Franklin, and Hampden, for the promotion of Agriculture and the Mechanic Arts. By Hon. MARK DOOLITTLE."

Industry is the great source of individual and national prosperity. The best mode of applying it to relieve the wants and necessities of society is the grand secret which should engage the attention of men in their progress to wealth and distinction. It is a trite remark, that whatever is worth doing is worth well doing. This is pre-eminently true in the business of agriculture.—The farmer who grasps at more land for improvement than he can cultivate to advantage, pursues a mistaken policy; some portion of it must run to waste. If a debt has accrued in the acquisition the chance is again to him that the avails of his labor will ere long find their way into the pocket of a mortgagee under a fore-closure. The idle and slovenly farmer is at best but a co-tenant, in his crops, with the beasts which are continually preying upon them, and with the basest vegetables in the frolicid possession. He who contents himself year after year with fifteen or twenty hundred of hay, or twenty bushels of corn upon an acre of his best land, lacks the skill or industry of the prosperous farmer. There has been great neglect in providing those enriching substances which are peculiarly nutritious to the vegetable kingdom. The labor of a single day in providing compost, under advantageous circumstances, when properly applied, will do more in filling your barns and corn cribs, than four times the labor spent upon a poor and barren soil. The farmer should learn the defects in the soil which he cultivates, and what can best be applied to cure those defects and increase its fertility. If your lands are too moist, add that which will render them less moist—if the marshy ground it is found that sand is the best manure; if your lands are too dry, of not sufficient capacity to retain moisture, apply the glebings from your ditches and marshes; if your lands are too adhesive, apply mud and ashes; if there is an excess of calcareous earth, says Sir John Foulair, "apply sand and clay; to soils with acids or salt of iron, apply calcareous earth." By a combination of these, a manure is secured very advantageous to the growth of vegetation. Some soils will receive incalculable advantage from an application which would be injurious to others. The best method of applying vegetable manure is to turn it under the furrow, and the fossil to remain upon the surface; the reason for this is the opposite effects which the

earth and the atmosphere have upon the different substances; the vegetable tending to the surface and to evaporation, and the fossil tending to the earth; by such an application they act upon each other in the best possible mode to give life and energy to vegetation. When the manuring is by turning under a green crop, a slight dressing with gypsum or lime is highly beneficial. Upon those lands where you do not use the plough after a dressing of vegetable manure, to apply immediately a small portion of the fossil, produces a more rapid decomposition of the vegetable and an incorporation with the soil most conducive to the growth of a healthy vegetation.

In tillage land it is believed to be a common fault that the earth is not turned to a sufficient depth. I am aware that different opinions prevail on this subject; but from well tested experiments which have been made, it has been satisfactorily proved that shallow ploughing is injurious—the root of the plant cannot procure the requisite nourishment. To make the earth productive, it is essential that the atmosphere act upon it, and the more earth which comes under the influence of heat and cold and atmospheric moisture, the more invigorating power is given to it to sustain a luxuriant growth. Again, by this method of culture, the earth absorbs more water and retains its moisture a greater length of time and at the same time is less liable to have water remain upon the surface. Many useful and well directed experiments have been made both in Europe and this country in this branch of agriculture. In Flanders deep ploughing has greatly improved their soil—it has been uniformly adopted there for many years—no part of Europe is more fertile.—The horticulturists near London, plough their lands a foot in depth—no lands are more productive.

Good fences are essential to the good management of a farm: to say nothing of the additional security to crops, or the time saved in being relieved from continued calls to remove from mischief the trespassing herds, or the expense saved in law-suits (which are often produced as a consequence,) by providing exterior fences—there is great actual gain in partitioning your fields into enclosures of moderate extent. The result of calculation on this subject is that a given territory of forty or fifty acres, applied to pasturage, will support twenty per cent. more stock, when divided into three or four separate enclosures, than when in one general field.

The cultivation of the grasses is an important branch in the business of a practical farmer. Linnæus has given us an account of not less than fifty different genera, which are cultivated in England. There may be as many found here; yet there are comparatively but few cultivated as a crop upon the lands of the New England farmer. More attention in selecting such seeds as are adapted to the different soils and to each other in the period of their becoming mature for the scythe, would find its reward in the results produced. It is no uncommon prospect when casting the eye upon the meadows of even our best farmers, to witness some portions of the crop nearly or quite fit for gathering, and another portion just beginning to come forward. When the latter has become mature the former has become nearly worthless. This may be the case when the grasses are indigenous to the soil; and it frequently arises from the practice of stacking lands from gleanings of the floors

and mangers of the barn "where every plant, good and noxious, has left its seeds." It has been found by experiment that many, and it is probably the case with most kinds of grass, that they flourish upon soils where they are never found till they are sown as a crop. The red clover, although an exotic plant, has proved to be a most profitable grass here as well as in England, where it was introduced about two hundred and fifty years since from Holland. Such suspicions were entertained of its utility in England, that it did not gain a general use there till within fifty years. It is more beneficial to the soil than any of the grasses. The principal cause of its fertilizing properties is the broad leaf, which imbibes more nutriment from the atmosphere than any other.—It is, however, not durable; hence other grasses should be cast with it in the seeding. Some of the best farmers in the northern States recommend the oat grass and orchard grass as the most suitable. The more usual practice in this vicinity, has been, to sow the herds grass with it. The principal objection to this practice is that the clover is mature for the scythe fifteen days earlier than the other grass, which affords double the nutriment, says Judge Buel, when cut in the seed, to what it does when cut in the flower. Perhaps no grass gives a better reward for cultivation than the herds grass; it is indigenous; so is the white clover and the red top, which afford, by attentive cultivation, rich and abundant pastures.

I am well satisfied that more attention to the cultivation of *Millet* would prove profitable to the farmers of old Hampshire. This grain is a native of India; it has for a long time been cultivated with great success and profit in the south of Europe, and farther north than our latitude. Its patrons in the New England and the middle States have found their reward in their attention to it.—To the Pennsylvania Agricultural Society, Judge Washington says, "I have obtained this season, (1833) forty tons from sixteen acres, of which only four had been manured; and my cattle of all sorts prefer it to white or red clover or meadow hay." Again, says Mr. Powell, of Philadelphia, "sheep are particularly fond of millet grass, but not more so than horses and other stock." It has been cultivated to a considerable extent in the eastern counties of this Commonwealth, and has very generally been approved by the farmers of Essex, Middlesex and Worcester. It has been less raised within our limits and Berksire, though some attention has been given to it in the western section of the State. The soil best suited to it is a light loam possessing a good degree of strength. Upon such a soil, the seed which you will obtain will usually exceed, in value, a crop of oats upon the same ground, though not over two thirds the quantity; the greatest profit in the crop will be found, however, in the straw for fodder; and should it never be used for farinaceous purposes it would be found a profitable crop. Its effect in the destruction of weeds is much the same as that of red clover; it probably draws more nutriment from the atmosphere than most other crops—it is less exhausting to the soil than oats—it should be sown about the tenth of June, and will be fit for harvest the last of August.

(To be concluded in our next.)

The tax levied in Philadelphia and liberties, for the support of the poor, the last season was about 90,000 dollars.

MERRIMACK AGRICULTURAL SOCIETY.

The committee on Farms began their labours on the seventh of August, last with viewing the Farm of Capt. David Morrill in Canterbury. This farm contains 150 acres of good land, divided into 40 acres of field land, 30 acres of wood land, 3 acres of maple orchard, 2 acres of apple orchard, and the remainder pasturing. The produce of the field land the present season, is five acres of wheat, two acres of corn, three acres of potatoes, two acres of oats, one fourth acre of flax, and forty tons of hay of a good quality. Capt. Morrill has five acres of good corn on his pasture land, manured only with plaster of Paris. His buildings are good, convenient and sufficiently large for his family and farm. He has built on his farm within twenty years, more than six hundred rods of stone wall. He has freed his field from bushes and stone heaps: his field is well secured with good stone walls and with good gates at all necessary and convenient places. He attends to gardening as much as is profitable at his distance from the market, raising a full supply of sauce for his family and carrots for his cows. He makes from his maple orchard from five to six hundred lbs. of sugar yearly. Capt. Morrill's cattle are of an excellent quality, and show that they are fed by their owner. He cultivates his farm with his own hands, aided by two minor sons, a boy of 12 years, and half a month of a hired man in haying. His work is done and well done in season; and from the quantity of produce raised by him, the committee are of opinion that Capt. Morrill is a man of uncommon industry, and that his sons are genuine chips from the old block; and that they all early learned that

"He that would by farming thrive,
Must either hold the plough or drive."

The committee also viewed the farms of the Hon. Joshua Darling, Maj. William Little, and Dea. Jeremiah Russell.

Judge Darling's farm contains one hundred and sixty acres of land, embracing a great variety of soil, and is divided into forty-five acres of field land, ten acres of reclaimed meadow, ten acres of wood-land, three acres of orcharding, and the remainder pasturing. The produce of the field land the present season is 12 acres of corn, 2 acres of wheat, 4 acres of rye, 3 acres of potatoes, one third of an acre of peas, one half acre of white beans, and about 48 tons of hay. Judge Darling's farm is well fenced and well cultivated. His garden is excellent, his buildings are large and convenient; his stock of cattle and flock of sheep are of an excellent quality. The committee could not learn the quantity of labour bestowed on Judge Darling's farm, but are of opinion that there must be more in proportion to the produce than on that of Capt. Morrill.

Major Little's farm contains ninety acres of interval land, of middling quality, and is mostly under improvement. He has occupied this farm five years, a part of the time, and at present by a tenant, who works the farm much better than tenants in general. Yet he is a tenant. Maj. Little has made great improvements by cutting bushes and reclaiming low ground, and making productive much land that was before barren. The produce of his farm the present season is seven acres of corn, twelve acres of oats, one acre of potatoes, $1\frac{1}{2}$ acres of wheat, and forty tons of hay. In the opinion of the committee, Maj. Little is entitled to

much credit for improvements on his interval, in making it produce four times as much hay for the two last years as it usually did while under its former owner.

Deacon Russell's farm contains 260 acres of land of a middling quality, and is divided into eighty-five acres of field land, seventy-five acres of wood and timber land, and the remainder pasturing. The produce of the field land the present year is eight acres of hops, seven acres of corn, two acres of potatoes, three acres of wheat four acres of rye, three acres of oats, and about sixty tons of hay. Deacon Russell works his farm in the ordinary way, except his hop fields, which receive his special attention, and reward him well for it. The committee are of the opinion that one acre of the hops will give as much net profit as three acres of corn, (taking Deacon Russell's account of it as a correct one.) Deacon Russell's buildings are convenient and large enough for his family and farm, and from all appearances we were led to believe that he had carried his hops to a good market.

The committee have unanimously agreed to award the following premiums: Capt. David Morrill of Canterbury, for the best cultivated farm, ten dollars; to the Hon. Joshua Darling of Danbury, for the next best do. eight dollars; to M. J. Wm. Little of Hopkinton, for the next best do. seven dollars; and to Deacon Jeremiah Russell of Bow, for the next best do. six dolls. To Dr Ebenezer Learned of Hopkinton, for his special improvement in making compost manure and cultivating his field of corn, five dollars. To Horace Chase, Esq. of Hopkinton, for his excellent kitchen garden, three dollars. To John Emerson of Andover to Hon. E. Webster of Boxborough, for his skill in gardening, three dollars. To Jeremiah Emery of Concord, for his great perseverance in reclaiming twenty-five acres of dead meadow, and making it good and profitable mowing land, three dollars.

The committee regret that there were no more farms entered for inspection and premiums, when there are so many good farms and farmers within the Society; but it is hoped that more farms will be entered next season, that there may be a fair competition. E. DUSTIN, *Chairman.*

ON THE USES AND VALUE OF THE ROLLER.

J. S. SKINNER, Esq.—Your correspondent, Mr. George H. Chee-man, of Rockingham, Va. having requested information, as to the benefit of applying the smooth roller to lands laid down to grain or grass and having myself been in the practice of applying the roller for twenty years, it is with great pleasure that I afford him the results of my long, and uninterrupted experience. I should never think of sowing grain or grass without the roller.

In answer to his questions, in the order stated by him, I reply that my own experience has only extended to light, loamy lands, some of them without, and some with small stones on the surface.—I have no clayey soil, but from my knowledge and observation of such soils, I should believe that there are none to which the operation of rolling, would be more beneficial than to them, provided the surface, at the time of rolling, was perfectly dry. It would in such a state of the soil, (I should suppose,) be eminently serviceable in breaking down the aggregated masses of clay; but in any other state of the clayey soil, I should suppose the

rolling highly injurious. But this is *mere theory*, having no practical acquaintance with such soil. In loamy, or gravelly, or sandy, or stony soils, the practice of rolling is, I can surely affirm, of great use. In sowing grasses, or grain, I have usually applied the roller, immediately after the bush harrowing. The effect of the roller, at that period, is eminently and unquestionably valuable. It leaves a smooth and beautiful surface, resembling the nicest garden culture. It prevents the unequal distribution of the grain or grass seed, (it is well distributed in the first instance by the sower,) by copious showers on an unequal surface.—It puts every stone, not exceeding four inches in diameter, below the scythe, and of course the sickle. It facilitates in a degree above our expectation, the germination of the seeds, whether of grass or grain, by bringing the soil into close contact with the seeds, many of which, without approximation, would remain for many days, or even weeks, without germinating.

On grain, or grass lands, I apply the roller in the *spring* after the sowing, but not until the surface has become so hard and dry that the horse's hoofs shall not penetrate the soil too deeply. I precede the rolling with a light harrow unloaded, never fearing the occasional dislodgement of the plants. I then follow with the roller, though the plants are often four or five inches high. The roller then settles the roots firmly in the ground, which had been raised by the preceding winter's frosts, and in one week I perceive the beneficial effects of the roller, though its first and immediate effect seems to those unaccustomed to its use, pernicious or destructive. The roller I have used has been of free stone, 18 inches in diameter and 34 feet in length; its weight I should suppose, cannot be less than 700 lbs. at the least; but as such rollers cannot easily be procured, a smooth log of 18 inches diameter, or a plank one of two feet, will answer equally well, having directly over the axis a box filled with stones to such a weight, as a common horse, can conveniently drag over an undulating surface. This can only be settled, by each individual, according to the strength of his horse and the inequality of his ground, of which, every man on the spot, can alone be the competent judge.

I have no hesitation to say, that among all the improvements of modern husbandry, the roller holds an important, and I should say, an indispensable place. JOHN LOWELL.

Roxbury, Oct. 31, 1837.

N. B. It may seem to those, who judge of the labour of any proceeding, by the words used in its description, that this is a very operose and expensive process. For the information of such, I would say, that an acre may be rolled by one boy and a horse, in one hour, at the most moderate calculation—at least so we find it in New England.

Int. Farmer.

To preserve Potatoes from the Frost.—If you have not a convenient store-place for them, dig a trench three or four feet deep, into which they are to be laid as they are taken up, and they covered with the earth taken out of the trench, raised up in the middle like the roof of a house, and covered with straw, to carry off the rain.—They will thus be preserved from the frost, and can be taken up as they are wanted.

From the New York American.

THE GRAPES.

Mr Editor, — Having seen a favorable notice in your paper of a treatise on the cultivation of the grape, I immediately sent to town for it. This book, the "*American Vine Dressers' Guide*," contains 137 pages, and can be read attentively, being half French and half English, in about half an hour. — Price 33 cents.

I am, Sir, a cultivator of the grape, not for wine, but for the fruit. I am an enthusiast in its cultivation; but enthusiasts without knowledge is no sense. Knowledge I wanted from Mr Loubat, the author of the book, but have sought it in vain; for to me, who have the experience of five years only, his book is of little value. The epistle to the *shade* of Franklin, in French, is well enough; but we could have spared the eloquent for the *useful*, which Mr Loubat seems in vain to have aimed at. When I first began with the vine, I sought information from every quarter — among other things, I read Cobbett's "*American Gardener*," who has in a few pages more useful information, than is contained in the whole of Mr Loubat's book. What Cobbett *knows*, he knows perfectly, and communicates so clearly, that if a man has any brains at all, he can be understood. — When he speculates, he is often like many other men, rash, wrong-headed, and presumptuous. In addition to reading Cobbett, I obtained accurate drawings of this plant, in its four first years' growth, from a gentleman who had successfully cultivated the vine. Drawings may be seen in Cobbett. With this information, and what I could get from the Encyclopædians, I went on blundering for the five years I have mentioned, being fully assured all the while that I should succeed, and that the most useful knowledge would be gained from my own experience. I have succeeded. But still five years' experience *won't do*; I am still ignorant. There are doubtless *nice* points in the cultivation of the grape very *nice* — these particulars I wanted to know from Mr Loubat. That I may be better understood than Mr Loubat always is, I will inform the reader that I live in the latitude of Albany, about thirty miles from the Hudson, which is neither on Lake Champlain, nor at Buffalo. As to the *kind* of vines, which is of all importance among us, that is, whether *late or early, good or poor bearers*, Mr Loubat says not one word.

Indeed he has not mentioned a single *variety* of vine by name, when all the world knows, that in the quality of fruit, whether plum, peach, pear or grape, as well as its character for *late or early*, these differences are all in all. Under the head of "*lopping*," Mr Loubat says, that during the first year, the vine may grow at *random*, unless planted from the roots; in this case, he directs us to pluck off as close to the stock as possible, all the useless "*sprigs*." Now what is the *purpose* of a grape? Not a word about the *filix wool*. A man versed in the cultivation of the grape, knows what Mr Loubat means, but not I on what he says. As to letting a vine grow at *random* the first season, you may with as much propriety let your children do the same thing. A *clean stem* from the beginning, no "*sprigs*," no false wood, as recommended by Cobbett, is the true thing. As to *pruning*, nothing can be less satisfactory than the directions given. "*Vine arbores*," I should like to see a vine arbour, with fruit, or the vine, from the *foreign* vine, beyond the walls of New York, in

this latitude. An *arbour* must be made of a vine that will bear our winter. I have heard it asserted during the present summer, that somebody had found out that the *foreign* vines, or some of them, would in the neighborhood of New York bear the winter. This would be truly a discovery. I know that the Black Cluster, White Chasselas, Golden Chasselas, and various other kinds of foreign grapes, are laid down at Brunswick, in New Jersey, and thus from necessity, to keep them alive.

"*Espaliers*," the author says, beware never to plant "too close" to the wall. "Too close," this is the real objection to half of the books that are written. An elementary book should take it for granted, that the reader knows nothing of the subject treated of. If Cobbett means six inches, he says six inches, if a foot, he says a foot. Besides I am not sure, that a wall is a good thing *here*. A gentleman at Poughkeepsie told me that his grapes against a wall mildewed regularly. They want air; he put them in the open ground, and succeeded entirely. — On this head I shall try both modes — of clipping and unclipping. As to "*clipping*," I believe that *fruit bearing branches* should be clipped, and that those intended for *next year bearers*, should not be clipped. This direction is not in the book. As to "*unclipping*" for *provençer*, you cannot have any thing more than the cat and her skin, and when you have the *fruit*, you have cat and skin too; and I imagine that the leaves for *provençer* in these states, would be as useful as potatoe vines, buried for manure, which I tried *once*, but not a second time. Of the "*vineism*" — This is what we call *girdling*; right or wrong, that is a word well known. Mr Loubat should have had a better translation of his French. "*Diseases of the Grape*." This is a fruitful topic; I know gentlemen in Boston, who have dug up their grape vines in despair, in consequence of mildew and rose bugs. But I believe that these enemies may be triumphed over; certainly not, however, if the physician knows not the cause of the disease. Mr Loubat writes in reference to a soil and climate which he is ignorant of, and this is an insuperable obstacle to his producing a book very valuable to us. As to that part of the book which treats of making wine, I know nothing about it, but recommend it to the *Harrisburgh Convention* — to that club of *disinterested* gentlemen it may prove truly useful; for I have no doubt that American industry, with ten times the labor and ten times the expense, and a good sound *prohibition* Tariff, may in twenty years, in New York or Pennsylvania, produce as good wine as Mr Loubat's "*celebrated*" Sauterne. May the good people of this country return to their reason, and may Heaven avert in its mercy, the calamity which would be brought upon us by the shocking principles contended for by this great Sanhedrim! But to the book — It is one thing to be a successful cultivator of fruit, and another to write a good book about the cultivation.

The very best single paper that I have seen, was published in the "*New England Farmer*," 23th October, 1825, written by a gentleman who has several times been in various parts of Europe, selected the best fruit himself, has seen the king's garden in England, has cultivated (I think) the grape for twenty years, and had great success. That gentleman, I think, has been good enough to supply me with six kinds of grapes, fitted for the open ground in my latitude. These vines are all young, and not in bearing. Should I succeed with any excellent variety, the gentlemen of the

Horticultural Society of New York shall have the results of my experience. To conclude, Mr Editor, the grape is an exquisite fruit; for health, I believe, none to be like it. An eminent physician of your city told me, that one of the most aggravated cases of dyspepsia he had ever known, was absolutely cured by the patient's eating plentifully of grapes for six weeks. I would not, Sir, for any consideration, unnecessarily say a word that could possibly injure a public spirited man, as I suppose the author to be; but the public has higher claims. I have no doubt that the cultivation of the grape is better understood in France than here; at the same time, there must be much yet to be learned, in this, as in every other species of husbandry, especially in reference to our own country. I would recommend, therefore, to our ingenious countrymen, the raising of the grape, which, in many cases, in the neighborhood of the great markets will prove very profitable, and in all, useful and delightful. A. B.

FOREIGN PLANTS AND SEEDS.

We notice with much pleasure a circular addressed by the Secretary of the Treasury to the American Consuls abroad in relation to the introduction of valuable foreign plants into the United States, and confidently expect from it most desirable acquisitions to our agriculturists. In his circular Mr Rush states it to be the President's wish that all such trees and plants from other countries not heretofore known in the United States as may give promise, under proper cultivation, of flourishing and becoming useful, as well as superior varieties of such as are already cultivated here, should be introduced. "Forest trees useful for timber; grain of any description; fruit trees; vegetables for the tables; esculent roots; and, in short, plants of whatever nature, whether useful as food for man or the domestic animals, or for purposes connected with the manufactures or any of the useful arts, fall within the scope of the plan proposed."

Each circular is accompanied with a specification of such plants as are supposed to exist in the countries where the consul, to whom it is addressed, is resident, and questions are to be answered by them in relation to the latitude, the soil, the seasons of bloom, the mode of culture, the diseases &c. incident to the plant; and whether there are any treatises in relation to them. — The different officers of the navy have been instructed to lend their aid in the promotion of these objects — directions for putting up and transmitting seeds and plants are also given at length. These directions we shall publish to-morrow, as they contain much interesting information and many facts of value to our agricultural friends at large.

It is to be regretted that at present no funds can be appropriated in the furtherance of this object and the suggestion which the circular contains, that Congress may probably make some provision for the purpose, will it is hoped be attended to. Our soil is so various, from cold to warm, and from sandy to clayey, that there is hardly any vegetable production but in some parts of the United States may be naturalized. No experiments have ever been made on so large a scale as this, in adding to our great garden the beauties and uses of others, and a better plan for accomplishing these purposes could not well be devised. In speaking of this subject, the Baltimore American very justly remarks that South America, especially, may furnish invaluable additions to our stock of useful im-

ported products; and experiments on their naturalization will not appear mispent to any one who adverts to the distant migrations of trees and fruits at present the most common amongst us. The Peach is from Armenia; the Cherry from the mountains of Persia; the Currant from Zante; the white (English) Walnut from Persia in China. The Grape has travelled over Europe from the east; and Coffee comes from a corner in Abyssinia; (we think it must have been the Happy Valley.) Science may greatly promote this insensible migration of valuable plants and trees; and we hope that this laudable aim of the government may be well seconded by its agents and citizens in distant climates.—*New York Statesman.*

From the Nantucket Inquirer.

The National Gazette of October 13th has the following communication:

"The water in the lower part of the city of New Brunswick is what is commonly called *brackish water*; it is unpleasant to the taste, and in the opinion of some, injurious to health. This has induced a few gentlemen in that part of the city to seek for a more pure supply by the modern practice of *boring for water*. They selected their spot, perforated the earth to the depth of two hundred and twenty feet, and then inserted, in the perforation, a tube of one hundred feet in length, reaching down to a body of solid rock, called the *red shell rock*. The upper end of the tube is inclosed in a wooden pent-stock, from which there issues a continual stream of water of (I should think without having measured it) from half a gallon to a gallon by the minute.

"The tide regularly ebbs and flows in the Raritan, and rises at this place about six feet, and the surface of the ground where the perforation is made, is elevated about eight feet above the high water mark. In this situation the stream issuing from the pent-stock corresponds exactly, and continually, with the rising and falling of the tide in the Raritan. When the tide is at ebb the stream is small; when it rises the stream increases, and when it is high the stream is at its greatest flow, varying at about one to three at the different states of the tide.

"Now, the rising of the water in the tube is itself a phenomenon not easily explained upon the known principles of hydraulics. Can it come from the river, when the point of discharge is from eight to fourteen feet above the surface of the water in the river? And if it should be attempted to account for it by supposing that it is conducted from higher grounds by dipping strata of rock, or clay, or other substance impervious to water, and that when such strata are perforated at any given depth the water pent up between them will rise as high as its surface in that confined state, does not this exclude the possibility of its having any communication with the river, or being in any way affected by it?

The fact is as above stated. Can it be accounted for upon any settled principle of philosophy? If water can be had by boring, in all situations, it is one of the greatest discoveries in modern times; and if it has a tide in the bowels of the earth, it presents a phenomenon unknown to philosophers both of ancient and modern times."

The facts here communicated, are interesting as they elucidate the structure of the earth's surface.

Geology has taught that the crust of the earth is composed of successive strata, or layers, differ-

ing in density from granite rock to clay and sand; these, many of them impervious to water, are placed regularly above one another, granite uniformly occupying the lowest place. These strata are not uniformly horizontal, but dip or incline from the horizon in various degrees;—the more superficial are also often discontinued over a great space, or are cut off by declivities, precipices, or watercourses; and the most solid are often displaced or broken up, apparently, by some convulsion of nature.

To account for the phenomena of the well in the above communication, it is necessary to consider the natural effects of a fall of water on the surface of the earth constructed as above described.

Water falling rapidly, as in a heavy rain, will first fill all the valleys, and then, breaking over the lowest place in the margin of each in succession, will cut itself a channel to the sea, or the great valley of our globe; and hence the origin of our rivers. But water falling more leisurely, is, much of it, taken up by the absorbing surface of the earth; and when this surface is saturated, the water continues to descend through it, by its own gravity, till it arrives at a stratum impervious to it.

And now let us consider the necessary effect of this obstruction: the several strata it has been said incline, more or less, from the horizon; the water, arriving at this inclined plane, then, will slowly, but certainly find its way along its surface till it arrive at a place where the stratum is discontinued or broken through; still impelled by its gravity, it will now sink to the next impervious stratum and pass on as before, till, arriving at a valley, a river, or at the margin or bottom of the sea, the stratum terminates, and the little water course finds its outlet.

It must be remembered that these subterranean rills have their source in higher land, often in mountains; that the porosity of the strata through which they must make their way, will generally cause their channels to be more or less obstructed; and that in their progress, often of many leagues, they may pass under other strata, which, for a time, prevent their rising to the surface.

Let this natural aqueduct, supplied with water from elevated fountains, struggling to make its way through an obstructed channel, be perforated from above, as in the case on the Raritan, what will be the necessary effect. Upon a known principle in hydraulics, water must rise in the bore or tube to the same elevation with its source. This would be literally and invariably true, if the channel of the stream were perfectly obstructed below the perforation: this however, is not often the case; otherwise, we should have no springs, and few continued streams; the obstruction is partial, and the water will rise in the tube till the weight of the perpendicular column exactly balances the amount of resistance in the natural channel of the stream.

I have said these rills may terminate on the sea shore and under the sea;—they do terminate in the neighborhood of the sea, on its shore, and in marshes adjoining it; for here springs are most numerous, and where a spring is, there is the mouth of a subterranean stream.

Now, the obvious effects of a flood tide on these springs would be to impede the stream & high supplies them, to lessen the discharge at their mouths, and, in the same degree to increase it at any other outlet which may be made higher in its course, as in the well at New Brunswick.

That these hidden streams are very numerous, is proved by the multiplicity of springs, and by the uniform success of the ingenious Disbrow in "boring" for water.

Kindred streams thus pursuing their secret course, often unite, and, finding little resistance rush on, till arriving at the foot of some ascending they burst forth in torrents upon the surface; as in several places in Pennsylvania; or still barred down by impervious strata, they pass on under cities, and far below the beds of mighty rivers, and only find their exit at the bottom of the ocean. Several instances are on record of fresh water being dipped up at sea, and a striking one was recently reported by a ship on the coast of Africa several leagues from land. "The ocean," says the Report, "was smooth, when suddenly the vessel shot into troubled water, leaving the appearance of being ruffled by some local cause over a considerable surface; the bucket was lowered and fresh water drawn up." This could have been no other than the outlet of a great river, displacing the salt water from its bed by the force of its current, and by its specific levity rising to the surface.

BLACKSTONE CANAL.

Length 45 miles, breadth 18 feet at the bottom, and 24 feet on the surface of the water. There are 48 stone Locks, which overcome a rise and fall of 450 feet.—Depth of water in the canal 4 feet.—Locks 82 feet long by 10 broad. Cost \$300,000. Estimated revenue \$550,000 to \$600,000. The supply of water is principally from the Blackstone river; but there are several ponds, one of which near Worcester, covers 2,500 acres, which in case of need can be used as fountains.

This canal commences in the harbor of Providence, Rhode Island, and extends to Worcester in Massachusetts. The articles to be transported on it are lime, granite, anthracite coal, from the town of Cumberland, 12 miles north of Providence and agricultural products in descending. The ascending trade will consist of cotton, wool, iron, flour, corn, groceries, and a great variety of articles, for the supply of the very large manufacturing population in the valley of the Blackstone river. This canal will increase the water power of the Blackstone river, and will furnish besides several additional mill privileges. It is expected to be completed some time next summer.

[*Pennsylvania Gazette.*]

Winter harvesting.—It is stated in the Worcester and Springfield papers, that there are large fields of corn still standing, great quantities of potatoes fast frozen in the hills, and thousands of bushels of apples in the orchards, waiting to be thawed out, before they can be gathered.

We noticed lately the same neglect in the towns on the Merrimack. Fields of corn were standing, apples lay piled up in the orchards, and men were digging their potatoes so late as last week. Why this extraordinary neglect? It could not be because the young men of our country towns had other and more important business to attend to; for we saw them by hundreds assembled at the tavern on a shooting match, firing at turkeys and other game. We do not believe that this sport promotes the good morals, the interest, or the valor of our farmers.—*Salem Obs.*

A great crop.—On an acre and a half of ground, a person in Norwich, (Conn.) has raised one hundred and fifty bushels of corn, after it was shelled; and five wagon loads of winter squashes.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, NOV. 30, 1827.

PRESERVATION OF TREES FROM MICE, &c.

To preserve young plantations of trees from being injured by rabbits, rats or mice—take any quantity of tar and six or seven times as much grease, stirring and mixing them well together. With this composition brush the stems of young trees as high as the vermin can reach, and it will prevent their being barked. Mice frequently destroy trees in nurseries, by gnawing off the bark beneath the surface of the snow. An application of the kind above mentioned, just before winter sets in, will, no doubt, prevent their depredations. Another method is to tread down the snow when it has recently fallen round the stems of the trees, which prevents the mice from approaching the trees near the surface of the ground, where they do the mischief.

RABBITS.

We do not see why rabbits may not be profitably reared in this country. The *Encyclopædia Britannica* says "In some situations these animals may be kept to advantage, as they multiply exceedingly, and require no trouble in bringing up. They delight in the sides of sandy hills which are generally unproductive when tilled; but level ground is improper for them. The fur of the rabbit is worth thrice the value of the carcase.—Therefore, supposing the rabbit to consume a quantity of food in proportion to the value of its carcase, it is a species of stock nearly three times as valuable as cattle or sheep.

Rabbit warrens ought to be enclosed with a stone or sod wall; and at their first stocking it will be necessary to form burrows for them, until they have time to make them for themselves.—Boring the ground horizontally with a large auger is, perhaps the best method that can be practised. Eagles, kites, and other birds of prey, as well as cats, weasels, and polecats, are great enemies of rabbits. The Norfolk warreners catch the birds by traps placed on the tops of stumps or trees, or artificial hillocks of a conical form, on which they naturally alight."

In this country, says the Farmer's Assistant, "We have no eagles or kites to molest rabbits; they breed very rapidly; their food is cheap and easily procured. A fence to enclose a warren can be made of boards at no great expense, which will keep out cats and polecats; and as for weasels, we have but very few of them in this country."

London says, "According to Mowbray, it is better to feed rabbits three times than twice a day. Rabbits are generally sold from the test, but there is also a demand for those of larger size, which may be fattened upon corn and hay with an allowance of the best vegetables. The better the food, the greater weight, better quality and more profit, which is generally the case in the feeding of all animals. Some fatten with grains and pollard.—The rabbit's flesh being by the allowance of succulent greens may tend to render it more juicy; and probably the old complaint of the dryness of the flesh in Devon beef, entirely fed with hay, might be remedied in the same way. Rabbits are in perfection for feeding (for minding) at the fourth or sixth month; beyond which period their flesh becomes more dry and somewhat hard. It requires three months or nearly so to make a rabbit thoroughly fat and ripe; half the time will

make them eatable, but by no means equal in the quality of the flesh; they may yet be over fattened as appears by specimens exhibited a few years since at Lord Somerville's, which were loaded with fat, without and within like the best feeding sheep.

"The flesh of the rabbit is esteemed equally digestible as that of fowls, and equally proper for the table of the invalid.

"The rabbit is a creasing animal, and equally fond, with the cat, of the head being stroked; at the same time it is not destitute of courage. A whimsical lady admitted a buck rabbit into her house, when he became her companion for upwards of a twelve-month. He soon intimidated the largest cats so much by chasing them round the room, and darting upon them, and tearing off their hair by mouthfuls, that they very seldom dared to approach. He slept in the lap by choice, and was as full of mischief and tricks as a monkey."

PRESERVING GRAIN.

A discovery of considerable importance has been announced, with regard to preserving grain. To preserve rye, and secure it from insects and rats, nothing more is necessary than not to fan it after it is threshed, and to stow it in the granaries mixed with the chaff. At this state, it has been kept more than three years, without experiencing the smallest alteration, and even without the necessity of being turned to preserve it from humidity and fermentation. The experiment has not yet been made with wheat and other kinds of grain, and they may probably be preserved in chaff with equal advantage.

YAMS.

There are several kinds of this plant, to wit:—Red and White Yam, (*Arum Esculentum*), and West India Yam, (*Dioscorea Sativa*). They grow on poor soil, even more abundantly than in rich, (where they are not to run too much to stem, and to be less productive at the root) and from the constant verdure which they retain to the latest period of the season, they enrich the ground little less than a crop of turneps. The yam is cultivated in most parts of Scotland and in North Wales; and, probably, not so profitably raised in this country. (*See N. E. Farm. Vol. iv. p. 298.*) Yams are said to be used chiefly for feeding cows; increasing the quantity without affecting the quality of the milk. As cattle eat them with the greatest voracity, there is danger in giving them in large quantities at a time. If the cows should be allowed no more than half a peck at once;—but this quantity may be repeated two or three times a day, taking care to allow a considerable interval between each feed. In the West Indies this root is given to mules. It is likewise used to feed chickens.

WEEDS.

Many weeds are introduced into fields by the slovenly practice of suffering them to grow and go to seed in yards, on dung-heaps, on the borders of fields, &c.

One year of good weeding
Will prevent the weeds' seeding;
But one year of their seeding
Makes seven years' weeding.

LAWN HEDGES.

The berries of the hawthorn should be buried one year in beds or pots of sand before they are planted.

POTATOES FOOD FOR HORSES.

To every 300 pound of potatoes, washed and steamed, is added half a pint of salt, and occasionally a small portion of sulphur; this quantity will more than supply a horse kept constantly at work for six days. Horses thus fed, will perform with the greatest ease, all the common labor of a farm, without hay or oats.

LEGHORN HATS.

We have received from Charles Thorndike, Esq. a quantity of the grain alluded to in the following note; and shall be happy to promote the laudable objects of Mr. Thorndike, by distributing it gratis to all who will apply at our office:

Mr. FESSENDEN,

A short time since, I received from my friends in Italy, about two bushels of grain, from which is procured the straw, of which the Straw Hats are made in that country; and have sent the same to the office of the New England Farmer, to be distributed to such persons in the country, as may feel an inclination to cultivate it.

Your obedient servant,

Boston, Nov. 27.

CHARLES THORNDIKE.

The annual Cattle Show and Fair of the Cheshire Agricultural Society was held at Drewsville on the third instant. Maj. Tufts, of Alstead, acted as Marshal, assisted by Captains Snow, of Drewsville, and Buffum, of Walpole. An address was delivered before the society by Thomas M. Edwards, Esq. which was highly creditable to its author. The audience, assembled in the open air, manifested their interest by profound attention, from the beginning to the end.

Notwithstanding the unfavorableness of the weather, the show was well attended, and in quantity and quality of good stock and manufactures exhibited, (it is said) will not suffer in comparison with former exhibitions. The dinner provided by Mr. Brown, was excellent, of which about 150 partook.

The officers of the year ensuing are the following:

STEPHEN JOHNSON, of Walpole, *President*,
Thomas M. Edwards, of Keene, *Vice President*,
Elijah Bingham, of Alstead, *Sec'y and Librarian*,
Leonard Bisco, of Walpole, *Treasurer*.
Aaron Hodgkins, of Walpole,
David Parker, of Charlestown,
James Dikey, of Acworth,
Francis Matson, of Stolar,
Elijah Belding, of Swaney,
Levi Chamberlain, of Pittsfield,
Nathaniel Holland, of Walpole,
James Chandler, of Alstead.

Executive Committee

ELIJAH BINGHAM,

Secretary of the Society.

SHEEP.

The introduction of a new breed of sheep, by the liberality of one of those brothers, whose patriotic attachment to the land of their birth, undiminished by the honors of another country, has manifested itself in conferring permanent benefits, has been noticed in the papers. We find in London's *Encyclopædia of Agriculture*, that the Devonshire Note is a race of long woolled British sheep, with thick necks, narrow and high backs, short legs, and large bones. The weight of the ewes, at three or four years old, is from 18 to 26 pound; the quarter of wethers, two years old,

from 20 to 30 pounds. The fleece, on an average, is from 6 to 8 pounds in weight. Their flesh is esteemed for the table. The wool is long and coarse, but valuable for some fabrics.—*Nat. Egis.*

The Weather.—The following predictions for the month of November particularly fitted to the city of Boston, but ingeniously contrived to answer for the adjoining states, are copied from that infallible oracle the Old Farmer's Almanac.

"I to 6, very fine for November—7 to 10, changes to cool—10 to 13, Changeable for some days—11 to 18, becomes warmer with frost—18 to 21, cool and rainy—22 to 25 fine sun, but cool mornings—26 to 30, now comes on a storm." These vaticinations of the prophet of the seasons will be found prodigiously useful to our agricultural friends in their preparations for the winter.—*Nat. Egis.*

It is not yet two years since the bill authorizing the commencement of the Pennsylvania Canal was introduced into the Legislature of that State; and now, more than two hundred miles of canal are under contract.

The United States Branch Bank in Providence, has had an accession of \$200,000 to its capital, making the whole \$800,000.

A good soldier.—Mr. Ichabod Dean, of Taunton, has performed military duty thirty-one years, under ten different captains, and never missed a training.—*Advocate.* [This is about equal to the corate who wore off the rims of seven Beavers, in exchanging civilities with his parishioners, and to about as much purpose.]—*Newburyport Herald.*

The judgment against the Corporation for the prize drawn in Gillespie's lottery, was finally settled on Saturday, by an issue of five per cent. stock for the amount of the judgment, interests and costs, amounting in all to more than one hundred and eight thousand dollars.

If the city were benefitted in any respect by this immense sum, we could see it paid without any unpleasant feelings; as it is, we must confess, we cannot without some reluctance see so large an amount leave us, and leave nothing with or in lieu of it, hot dear bought experience.—*Nat. Journal.*

Proposals have been issued for publishing, at New Echota, in the Cherokee nation, a weekly newspaper to be entitled the Cherokee Phoenix; for the exclusive benefit of the Cherokee Indians. The editor, Elias Boudinot, is a full blooded Cherokee, and was educated at Cornwall Conn.

The pedlars in China carry jars of spawn about from one province to another, through the whole empire, for the purpose of stocking every lake with all the different kinds of lake fish.

Singular Fact.—The Worcester Mutual Insurance Company was organized, and commenced issuing policies, in May, 1824, three and a half years since. It has insured to the amount of about seven hundred thousand dollars, on buildings and property in all parts of the county, and yet it has never sustained the loss of a single dollar by fire.

Canal Commerce.—The canal navigation has been obstructed partially with ice for several days, and there are said to be over two hundred boats detained between Albany and Utica. A few boats that had worked their way ahead, arrived on Saturday, and forty-eight boats cleared on the same day with merchandise.—*Albany Argus.*

Fruit Trees.
WM. PRINCE, the proprietor of the Linnean Botanic Garden and Nurseries at Fushing, L. I. has the pleasure of informing the public, that his nursery now contains 172 varieties of the Apple, 202 of Peas, 26 of Cherries, 139 of Plums, 25 of Apples, 31 of Peach, 30 of Nectarines, 26 of Almonds, 11 of Mulberries, 6 of Quinces, 16 of Currants, 15 of Raspberries, 17 of Gooseberries, 20 of Strawberries, 257 of Grapes, 600 of Ornamental Trees. Above 500 of the above kinds of Fruits are not to be found in any other collection in America.

The different varieties cannot be otherwise than genuine, as the greatest attention is paid, and nearly all the limbs are inserted from bearing trees. The Cherry, Peach, and other trees are generally of large size. Catalogues may be obtained at the New England Farmer office, gratis, and orders left there or sent by mail, will meet attention.

Garden, Field, and Flower Seeds.
We have now for sale, at the office of the New England Farmer, No. 52 North Market Street, Boston, the largest variety of Seeds to be found in New England,—mostly of the crops of 1827. The greatest care has been taken to have them raised by our most experienced seed-growers, and to have the seeds perfectly genuine. The following comprises our most prominent kinds:—
Artichoke, Green Globe
Asparagus, Devonshire
Battisea
Large White Reading Beans, (26 varieties, including the English broad beans, dwarfs and pole)
Beets, true Long Blood
Early Blood Turnip
Early White Scarcity
Yellow turnip rooted
Borcoks
Brocoli, Early White
Early Purple
Long Orange
Cabbages, (22 varieties, including the Russian, and common kinds, early and late)
Cardoon
Carrots, Altringham
Long Orange
Early Horn
Blood Red (for West India market)
Lemon
Purple, (fine sort)
Cauliflower, Early and Late
Celery, White solid
Rose coloured solid
Italian
Celeric, or turnip-rooted
Chervil
Chives
Green End, or Vetch-Best
Cross, Cured or Peppergrass
Broad leaved or Garden Turnip
Water
Lilowale, Excellent ROOTS AND PLANTS, FIELD AND GRASS SEEDS, PUT AND SWEET HERB SEEDS, MEDICAL HERB SEEDS, BIRD SEEDS, and more than 200 different kinds of ORNAMENTAL FLOWER SEEDS.

Cucumbers (6 varieties, including White and Green Turkey, &c.)
Egg Plant, Purple and White
Endive, Green & White curled
Batavian, for water
Garden Beans
Garlic, 14 varieties
Italian Corn, (several varieties)
Kale, Sea
Purple curled
Green curly
Scotch
Leaf, London
Large Scotch
Greens, 14 varieties
Melon, 11 varieties
White and Brown
Nasturtium
Ora
Onion, 3 varieties, including the imported Madeira, Potatoe and Tree Onion
Parsley, 4 varieties
Parsnip, Large Dutch swelling
Peas, 16 varieties
Peppers, 14 varieties
Pumpkins, Finest Family
Concomit, Field
Mammoth
Radish, 9 varieties
Rhubarb, for tarts, &c.
Salsify, or vegetable oyster
Skirret
Scarlet
Spinach, 5 varieties
Squash, 7 varieties
Tomatoes, 15 varieties

As the variety and quantity of Seeds kept at this Establishment are by far greater than at any other place in New England, or orders for the British Provinces, the West India market, or the Southern States, can always be executed with promptness, at satisfactory prices. Dealers in Seeds and Country Traders supplied, at wholesale or retail, on the best terms.
We have now on hand, of this year's growth,
200 lbs. Mixed Water-Cress & Sweet Beet, raised by J. Prince, Esq.
100 lbs. Onion Seed, Red, White and Yellow.
175 lbs. true Blood Beet, raised in Roxbury
150 lbs. Carrot, various kinds
150 lbs. Radish, superior quality
100 lbs. English Turnip, raised in Roxbury
75 bushels Peas, early and late.—[We have about 30 bushels of the Early Washington Pea, which was procured by the few who could obtain it last year—as our supply was small—the earliest and most productive of any brought into the Boston market.

Among the new vegetables we have introduced, and which are not common in the Boston market, are the Early Russian Cucumber, [very early], Congo or Congo Lettuce, Green Pea for winter use, Purple Cress, Great Annona, Lima and Valparaiso Spanish, Siberian Parsnip, (the New) and Cabbage, Yellow Malta Turnip, Cucumber, the Lion, Pumpkin, Lady's Finger Pea [a new and fine one grown] and New Zealand Spinach.

For Catalogues of the whole Establishment, with directions for cultivating the most rare and delicate sorts, comprising a pamphlet of 30 pages, furnished gratis.

An active and business like man, of unimpeachable integrity, is wanted to take a share in an Agricultural and Horticultural speculation, which promises the most profitable results without risk. A capital of \$5000 will be necessary. For particulars, apply by letter, (post paid) to MR. ISAAC WINSLOW, Merchant,oston

JAMES BLOODGOOD & Co's.
Nursery, at Fushing, or Long-Island near New York.

IN behalf of the proprietors of the above nursery, the subscriber solicits the orders of horticulturalists, who may be desirous of stocking their gardens and fields with fruit trees of the finest sorts, and most healthy and vigorous stocks the present autumn.

Bloodgood & Co, in a total prosolity to the incubating and growing of all their fruit, and purchasers may rely with confidence that the trees they order will prove genuine.

The subscriber, agent of the above nursery, will receive orders for any quantity of
TRUIT AND FOREST TREES,
FLOWERING SHRUBS,
AND
PLANTS.

All the trees will be delivered in this city at the risk and expense of the Purchaser; the bills may be paid to him.

The reputation of this nursery is so extensively known and has been so well sustained that I take leave to refer those who want of trees to any of the Horticulturalists in this city and its vicinity, and if a verbal demonstration is desired, I invite those who wish to be thus satisfied to examine the trees in my garden at Rochester, procured from this nursery for three or four years past, some of which are now in bearing, all in a healthy and vigorous state.

Catalogues will be delivered gratis on application to
ZEB CROCK, Jr
Rogers' Building, Congress-Street.

This day published by Richardson & Lord, at their own and country book store, the Old Corner, at Amesbury for 1827, by B. B. Thomas, Esq. containing the usual quantity of new, useful, and entertaining matter, together with the sun's declination. Country traders supplied by R. & L. at the lowest rate. In the press, and will soon be published, the *Miniature or Pocket Almanack*, likewise the *Massachusetts Register for 1828*. 11

From the London Star.

AN EMIGRANT'S ADIEU TO SCOTLAND

Our native land, our native vale,

A long and last adieu!

Farewell to bonny Teviotdale,
And Cheviot mountains blue!

Farewell, the hills of glorious De-
And streams renew'd in song!

Farewell, ye bythcane braes and meads—
Our hearts have lov'd so long!

Fare ye ell, ye bonny cliffs knowes,
Where thyme and hawthorn's green;
Farewell, ye heathy haunted hives,
O'erhanging with folk and sloe!

The battie mound, the Border tower,
That Scotia's annals tell—
The martyr's grave, the lover's tower,
To each, to all, farewell!

Home of our hearts! our father's land,
Land of the brave and free!
The soil is flapping on the breeze
That bears us far from thee!

We seek a land and distant shore,
Beyond th' Atlantic main;

We leave thee, to return no more,
Nor view thy cliffs again!

But may dishonor bright our fame,
And quench our household fires,
When we, or ours, forget thy name,
Green island of our sires!

Our native land, our native vale,
A long and last adieu!
Farewell to bonny Teviotdale,
And Scotland's mountains blue!

IMPERIUM EST.

Every man who builds, and wares, where he will to pay,
Incurs a liability from the Government.

Causes of offence.—Lord Chesterfield says, that seven are more unwilling to have their weaknesses and imperfections known than their crimes. And that if you hint to a man that you think him ignorant, silly, or even ill bred, and awkward, he will hate you more and longer than if you tell him plainly you think him a rogue.

High notions.—Some people have such ideas of honor, and such high opinions of their own consequence, that they are offended at many things which take place in society where no offence was intended. A sensible man is not a very sensitive man.

Cheap goods.—Those articles which are sold cheapest, generally are the most expensive purchases. If a thing is good for nothing, it is a folly to give any time for it.

Empty heads.—It is with men as with barrels—those which are empty make the most sound.

To be thrifty.—It is generally better to give a poor man something to do, for which he is well paid, than to give him money without an equivalent in labor.

A great fault.—A great fault in the possession of a weak man is a great advantage, both to the public and to the individual. Riches increase his power to do mischief, and extend the pernicious effects of his bad example.

A good road to a good destiny.—Be studious and you will be learned. Be industrious and fru-

gal and you will be rich. Be sober and temperate and you will be healthy. Be virtuous and you will be happy.—*U. S. Gazette.*

Lord George Germain was of a remarkably amiable disposition; and his domestics lived with him rather as humble friends than menial servants. One day entering his house in Pall-Mall, he observed a large basket of vegetables standing in the hall, and inquired of the porter to whom they belonged, and from whence they came?—Old John immediately replied, "They are ours, my lord, from our country-house."—"Very well," rejoined his lordship. At that instant a carriage stopped at the door, and lord George, turned round, asked what coach it was?—"Ours," said honest John.—"And are the children in it ours too?" said his lordship smiling.—"Most certainly, my lord," replied John, with the utmost gravity, and immediately ran to lift them out.

There is a story told of a French sharper having arrived in New York so destitute that he was under the necessity of using "Ways and Means," in order to "Raise the Wind," and pay his way. Accordingly, he advertised that he had a monkey, of extraordinary sagacity, that he would exhibit on a particular evening. Tickets of admission were issued, the room was tolerably well attended, and the hour of the promised performance arrived. The audience full of expectation, were anxiously awaiting the extraordinary animal's appearance, when, to their disappointment and astonishment, the little Frenchman stepped forward on the stage, and spoke as follows: "Gentlemen and ladies—here will be no performance this night—de monkey very sick."

Fasting.—Dr. Knight, in his work on insanity, relates some curious instances of obstinate disinclination to food among the insane. One man, John Booth, aged about thirty five, fasted fourteen days. "He certainly," says Dr. K., "took no food during this period, and though he had access to water, I believe he never drank any. He amused himself by walking in the galleries of the asylum, and very seldom sat or rested, yet he appeared as equal to exercise at the end of the fortnight, as at the commencement. His pulse continued good to the last; his tongue, which was furrow and brown at the beginning, had become clean; and his breath which was very offensive, as the breath of lunatics usually is, had become as sweet as an infant's. He was generally very haughty and taciturn, but had now become more tractable, and I at last succeeded in drawing him into a conversation. He told me he had not experienced any benefit from eating, that it had frequently made him ill, and that he had, therefore, resolved to refrain from it altogether. I asked him if his objection extended to medicine also; to which he replied, he would take any medicine I thought fit to prescribe. I told him it would be necessary to drink it in beer, tea, to which he consented. A pint of good beer tea was accordingly sent to him, and he readily took it, and in a convenient time the dose was repeated, and so he was humored till his appetite returned, when he again took his food as usual, and finally he was discharged well."

The Mexican Congress has appropriated \$45,000 to defray the expenses of commissioners to examine and report upon the boundary line between the United States and Mexico.

French Chestnuts.—Ten chestnuts, which grew in the garden of St. Mary's College, Baltimore, from seed brought from the south of France, weighing 8 ounces. Ten American chestnuts, of the average size, weighed 1½ oz.

To make durable candles.—To ten ounces of mutton tallow, add a quarter of an ounce of camphor, four ounces of bees-wax, and two ounces of alum—melt them all together, and make your candles.

A writer in the Norwich Courier recommends the establishment of a Rail Road from that city—to connect with the Rail Road from Boston to the Hudson, if made.

Glass being a non-conductor of lightning, it is suggested that were farmers to put only an inverted broken bottle on the conical top of their hay and wheat stacks, fewer instances of their being destroyed by lightning would occur.

It is proposed to construct a Rail Road from Concord, N. H. to Ogdensburg, on Lake Ontario. Concord is sixty miles north of Boston, and enjoys the privilege of a canal to the latter place.

Trees, Ornamental Shrubs, &c.

ANY WISEMAN who, in his Nursery, in Eighteen hundred and thirty seven, had planted Trees, Shrubs, &c. His selection of Fruit Trees, Apples and well selected; and his variety of Flower and Shrubbery, comprising the various kinds of Fruit Trees, such as Apples, double flowering Apples, red and white Apples, Pear trees, Egg-shoots, Ribbles, various kinds of Quinces, Syringes, Laburnum, Syringes, Ribbles, Apples, Plums, Pear trees, Mountain Ash, Laburnum, grandiflora, Japan pear, Japanese cherries, &c. &c. for any of these articles list with Mr. S. & Co. in the New England Farmer office, will be executed on the same terms as the one sent, and delivered in Boston from the spot.

New England Farmer's Office, for 1828.
Just published at the New England Farmer's Office, and for sale by BOWLES & DEVEREUX, 7 Washington Street, and at the Bookstore of J. W. WELLS, 100 South Market Street, Boston, for 1828. By J. W. WELLS, Editor of the New England Farmer.

Gooseberry Bushes.

Persons in want of several varieties of Gooseberries, can procure the bushes, by sending their orders to the office of the New England Farmer. They are from Glasgow in Scotland; the fruit is fine flavored and large, some may be seen at this office measuring 3 and 4 inches in circumference and of white, red and yellow color. The price will not exceed \$1 per dozen.

Pigeon Cotes.

For sale, 3 pair of Pigeon Cotes or Hoops of Geese; they are generally superior to those common bred, in the great size they attain in the flocks with which they may be raised, and in the comparative small quantity of grain required to fatten them.—Inquire at this office.

Vertical Root Trees.

Just received for sale at the office of the New England Farmer, a further supply of standard vertical Root Trees, among which are Lamb's Ear, Dog, &c. of Agriculture, and the various kinds of Fruit Trees, and Gardening, the various kinds of Fruit Trees, and Gardening.

Just received at the New England Farmer office, a further supply of "Melon's" American Garden. This work is the most elaborate of its kind ever published in the country, it contains a number of directions for the management of the kitchen garden, fruit garden, orchard, vineyard, &c. &c. in every pleasure ground, flower garden, green house, hot beds, and forcing frames, for every month in the year.

Dunlop's Nursery.

Orders for Fruit and Ornamental Trees, received by Joseph P. Nowell, No. 32 North Market Street, where a catalogue may be seen.

The FARMER is published every Friday, at \$2.00 per annum, or \$1.50 if paid in advance.

Gentlemen who procure for themselves subscribers, are entitled to a fourth volume gratis.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

FARMING.

JOHN ANDREW, Esq. of Salem, has this year raised one hundred and sixty-six bushels of Indian corn, on one acre and a half of land, at his farm in Danvers, which is more than one hundred and ten bushels per acre.

A Turnip raised on the same farm, weighed without the tops, eight and one half pounds.

To give some idea of the extent of agricultural operations in England, and the amount of capital employed, Sir JOHN SINCLAIR, in his *Improvement of Husbandry of Scotland*, states, that one individual in Norfolk, who occupies a light land farm of 1500 acres, had at one time a compost heap for turnips, that cost him £900 sterling, equal to 1000 dollars. That exertion, however, he continues, is surpassed by Mr WALKER, of Mollondean in Roxburghshire, who in one year hired 344 English acres, at no less an expense than £2,552 10s sterling, equal to \$11,344.44.

BEEES.

MR FESSENDEN—From its high character we are accustomed to resort to the New England Farmer, as a vehicle replete with knowledge pertaining to systematic agriculture, horticulture, and to rural and domestic economy. Among the numerous and important improvements in the branches, very little has been promulgated respecting the culture of bees. Some simple, practical lessons derived from experience, on the management of an apiary would be deemed by a certain class of your readers, both interesting and profitable. These little industrious insects furnish a luxury for the table, a valuable material for the artist and manufacturer, and at the same time personal gratification and amusement to the possessor, peculiar to themselves. The little "busy bee" is of more extensive utility than the Cochineal or Cactus, or, indeed, all other of the insect tribe which have been described by naturalists. An apiary, therefore, is a very desirable appendage to every rural establishment, often yielding a greater net profit than most other articles of stock, which the husbandman considers worthy of his attention.

Although for ages the bee has been the subject of consideration and wonder in all countries, its real character, its capabilities and republican economy are but imperfectly understood. The most advantageous method of management is a desideratum with cultivators of these useful insects. It is reasonable to suppose that the most eligible mode would consist in consulting their own instinctive natural course and habits, permitting them to enjoy their own rights and liberties with as little infringement as may consist with the interest and views of the cultivator. It is known that when in an undomesticated state it is in their character to congregate in the cavities of large trees, and when these are sufficiently capacious, they multiply, and increase in numbers and in stock of honey in a surprising manner, for many

years, without sending out a swarm. Instances have also occurred of their possessing themselves of some apartment in dwelling houses, where their collection of honey and wax has been immensely large. A friend has recently informed the writer, that his garret is now occupied by a large family of these industrious insects, who have for two summers stored the effects of their labor in combs suspended from the walls, and they have manifested no signs of swarming. These facts would seem to suggest the expediency of employing for our domestic hives, hives of large capacity, and on some occasions it might be best to unite two or more swarms in one hive as recommended by some late writers, who assert that small swarms are less active and industrious than those that are larger, and are more liable to be assailed by enemies of their own species or other insects.—The larger the number of bees, it is said, in a hive, the greater will be their industry and success. It appears that they are discouraged by the smallness of their own numbers, their instinct is affected, they labor with less activity, they cease to keep guard at the entrance of their hives, and testify more indifference for their own fate and that of their young."

The evil practice of destroying the bees in autumn to secure the stock of honey which they have collected ought to be abandoned. The method of taking the honey by means of boxes placed in the upper part of the hive is unquestionably to be preferred, as the boxes may be taken when full of pure virgin honey and replaced with empty ones, at any time in the summer.

Whether it is to be considered advisable to employ hives larger than those in common use, that they may swarm but seldom, and what is the most eligible method of guarding against the attack of the Bee-moth, (sphinx atropos), are questions which the writer and many of your readers would be gratified to have solved, as no preventive of the destructive effects of the bee-moth hitherto proposed appears to be effectual. As the Agricultural Society by their Committee, have awarded to Mr E. Withington of Dorchester, a premium for his sample of honey and his mode of managing bees, it is desirable that this communication should be made public through the medium of the *New England Farmer*.

Yours truly,

MEDICUS.

Old Colony, November 27, 1827.

BY THE EDITOR.

Mankind in general do not appear to be fully aware of the importance of the Bee. In the East, the ox and the sheep are scarcely more so valuable to man than this little insect. In medicine and in the arts, honey and wax are of prime and almost indispensable utility; and for many culinary purposes it would not be easy to find an adequate substitute for these substances. We should be happy to receive further communications from "Medicus," and hope to devote a larger portion of our paper than we have hitherto done to these industrious and wonder-working members of communities, whose police is so admirable, industry so exemplary, and products so valuable.

TARRING TREES IN AUTUMN.

MR FESSENDEN—In the *New England Farmer* of the 23d ult. is an interesting communication of the subject of the Canker Worm. The writer assigns, no doubt, one of the true causes why the hopes of the farmer have so often been blasted, after having with assiduity tarred his trees in the spring of the year. He has seen all his exertions baffled, and his fruit destroyed by this destructive insect. I would beg leave to suggest another cause of failure in destroying the insect by *spring tarring*, and that is, the enemy has got the start of him, from having a *ceded the tree in the preceding fall*, deposited his eggs, &c. By turning to Dr Thacher's *Orchardist*, page 85, [an excellent work that ought to be in the hands of every farmer,] the following observations which are worthy of the most extensive circulation, will be found.—"He has ascertained [Professor Peck, of Cambridge,] that a part of the Canker Moths, rise in the autumn and deposit their eggs. They are such as were an inch or two below the surface, those that he deeper are not affected by the transient changes of the atmosphere in November, and do not rise till spring. Those which rise in November are not very numerous, compared with those which rise in the spring, but being very prolific, are exceedingly injurious, if no means are taken to prevent their ascending the trees, as the winter's frosts do not kill the eggs."

Now, sir, this is not an idle chimeric; it is a fact, not so generally known as it ought to be, that a part of the canker worms, often enough to destroy the hopes of the farmer, ascend in the fall of the year. The number of those that make good their lodgment on the trees, no doubt depends on the weather. If it be moderate and winter be tardy in its approach, the greater will be the numbers that ascend. The autumn of 1826 being very moderate, immense numbers of the canker worm, in this town and on the island of Rhode Island, ascended and thus blighted the hopes of the farmer, notwithstanding they faithfully tarred their trees in the spring of 1827. A few who tarred both in the fall and spring succeeded in destroying the enemy. One farmer who had neglected to tar in the fall, having the past spring found that the insect had got the start of him, commenced shaking his tree, limb by limb, a number of days in succession, and as they spun down, with a circular motion of a light pole or switch knocked them to the ground, at the same time tarring his trees, thus prevented their re-ascend. He was amply rewarded for his trouble, in having a plentiful crop of apples, while his neighbors who practised spring and neglected all tarring, had not made use of this expedient, had their orchards eaten up.

This winter, cold weather has approached us with hasty strides, yet not so as to prevent the ascent of the canker worm, which commenced about the 20th October, as ascertained by many of our active farmers, who were on the alert with their tar kettle, ready to meet the enemy. After ten days' severe cold weather, on the 28th it having moderated, the surface of the ground around the trees being warmed by the genial rays of the sun, the worms were busy in their movements upwards. In short, it seems necessary to commence tarring

is early as the middle of October, and continue the operation whenever the weather favors their ascent, which should be carefully watched through the winter if there should be a long thaw and particularly in the spring, as soon as the frost leaves the ground, not fail to be ready for them and what is more, to continue the practice long enough to prevent the young ones, hatched from eggs deposited under the crevices of the bark below the air, from ascending, as their parents were in the first instance.

It is a practice in this region, as directed in Thacher's Orchardist, page 91, to mix a quantity of Curry-oil or soap grease, no matter how rancid, with the tar, which serves to render the latter more liquid. If a strip of cloth or common brown paper, 6 or 8 inches wide, is made fast around each tree, by a small string above and a large one on the lower edge, made of swinging tow or hemp, midway between which, the above composition is applied with a painter's brush. The larger string will stop the descent of the more liquid parts of the tar, which will remain a longer time soft on account of its accumulation and a fresh application is not necessary so frequently as otherwise.

L. W. B.

Bristol, R. I. Nov. 30.

SOUTH AMERICAN HORSES.

MR FESSENDEN—I observed in your last number of the New England Farmer, an extract of a letter from an officer of the Navy, to the Editor of the American Farmer, informing us that the horses of Chili and Peru are worth nothing.

If the writer of that article had been content with asserting that he had seen no horse worth sixty dollars, I should have easily credited him, as I am inclined to suppose his observations have been confined to a few ports on the coasts of those countries; and the miserable hacks which are let and sold to strangers, in Valparaiso and Lima, would certainly prejudice him against the horses of the country.

But the assertion that there is no horse to be found in Chili or Peru, worth one hundred dollars in the United States, is inadmissible by any one who has been in the interior. The climate of Lower Peru is not so favorable to the horse as that of Chili—and the armies which have been maintained, and the revolutions which have taken place, both in Peru and Chili, have destroyed vast numbers of fine horses, and have also caused the breeding of them to be neglected, as the owner of a fine animal was sure to be deprived of him, by one party or the other. There are still, however, on many estates in Chili, fine breeds of horses, and a few years of quiet and steady government, will make them as abundant as ever. The original stock of these horses was the finest of Andalusia. They are generally light, but well made, extremely docile, sure footed, fleet, spirited and hardy, performing the most painful services, with the worst usage, and poorest of fare—no provision is made for them, and on journeys of many weeks they have nothing but the scanty gleanings of grass by the roadside.

I know nothing of the value of horses in Mary-

land. There are generally in the neighbourhood of cities, large fields of Lucerne, on which their horses are fed throughout the year. In the vicinity of Santiago and Lima, many thousand acres of lucerne are cut and daily carried to those cities. It is the only grass cultivated from one end of the coast to the other, and was in general use a century since as at present.

land, but having resided a number of years in Chili, and travelled much both there and in Peru, can speak with confidence of the good qualities of their horses. I would willingly exchange a horse valued at two hundred dollars in Boston, for several which I have owned in Chili, that cost from twenty-five to thirty-five dollars in the interior.—The horses from Mendoza and all parts of the province of Cuyo, are considered much inferior to the Chili horses, and are rarely bought by a native, except with a view of selling them to a foreigner.

A RHODE ISLANDER.

Providence, Dec. 4, 1827.

DISEASE IN SHEEP.

MR FESSENDEN—Permit me to ask for a little information through the medium of your interesting paper. There is a complaint attending sheep, which I have frequently observed among my own, and heard of among others, but have never known it designated by any name, except once, when a distinguished breeder and shepherd termed it the "stretches," which to those much acquainted with sheep, will probably be a sufficient description. The sheep mostly or entirely refuses food, generally lies down more than usual, and frequently appears uneasy and agitated with pain, often extending its fore feet as far as it may from its hind ones, and stretching itself to the utmost.—These appearances continue sometimes for several days together, and it not seldom happens that the same sheep is attacked in the same way several times, and that too, perhaps, in one season. I have oftener seen wethers attacked by this evil than any other class of sheep, although I suspect no sheep are exempt from the disease, whether old or young, fat or lean, male or female. I have never observed a case of the kind excepting in the cold season, which, however, is the period when we should be the most likely to notice it, as they are then under constant inspection, so that possibly it may occur at other times. I have thought it a complaint of the intestines, and have seen one case to confirm this opinion, so far as it was decisive of anything.

I lost, two or three winters since, a fine wether, strongly exhibiting all these symptoms, refusing food almost entirely, I think about a week, when he died. I administered such remedies as my ignorance would permit, but they gave no relief, and appeared only to torture the afflicted animal. After his death, I examined him, to find if I could what occasioned it; and soon discovered in the small intestines a cause sufficient for the effect. A substance about the shape and size of a common sausage, had completely closed the passage, one end of it adhering to the gut all round, and pushing itself along in it three or four inches, in an unconnected manner, excepting that it about filled it. This substance, I think, contained a matter between yellow and green, along through the centre; indicating I conclude, that it would have been an ulcer when matured. But whether any thing like this, in any degree, is the usual cause of the complaint under consideration, I shall not presume to determine.

I can only say, that I discerned no difference between this case and others, except its long continuance, while the sheep was living. Should any of your practical correspondents know the nature of this disease, or an effectual remedy, or a sure preventative, by transmitting this knowledge for

place in your paper, they may benefit many, besides

E. S. P.

Gilsum, N. H. Dec. 4, 1827.

POMACE.

MR FESSENDEN—Seeing in your paper of the 5th of November an article relative to the disposal of apple pomace, which from my own experience I think incorrect, I have thought proper to offer a few remarks on this subject.

I have for eight years past made from 150 to 300 barrels of cider annually, and have disposed of my pomace in the following manner: my piggery is situated near my cider mill house, and consists of two apartments, each sufficiently large to contain my pomace, and other substances intended to make manure, for one year. Here I throw my pomace, when sufficiently pressed, for my hogs to work over, which gives them constant employment, and I am of opinion that they get considerable nutriment from it. The next season, after the frost is out of the ground, I throw in some loam, and in the summer, at leisure times, I continue to throw in weeds from my vegetable garden. My hogs keep continually rooting this compost over, and causing the pomace to decompose, which, at the end of fifteen or eighteen months, makes excellent manure.

The next season for making cider, my pomace is thrown into the other assortment, which passes through the same process. I usually keep six or eight hogs, which are divided and kept in these apartments. My mill house, and other accommodations attached to it, consists of a building 80 ft. long and 23 ft. in width. The water spouts of this building have conductors to carry the water into each of these apartments, which are kept continually moist, and which I think very important for my hogs to wallow in, in the heat of summer, as well as to decompose the pomace. I take out of one of these apartments upwards of 25 ox-cart loads of excellent manure, every spring. I have given my low mowing land a top dressing of this manure, and have taken the same year, a crop of hay equal to 2½ tons to the acre, and a crop of rowen equal to 1 ton to the acre. This manure I consider worth to me from 25 to \$30, besides the service the pomace is to the hogs.

Before the adoption of this plan I used to throw my pomace into my pastures, upon rocks, and received little or no advantage from it.

I have not written the above with a disposition to differ from any person in opinion, but with a view to general utility, upon a subject apparently trifling, yet connected as it is with the numberless items that engage the attention of farmers, it may serve as a spoke to support the firm wheel of Agriculture.

A FARMER.

Norfolk county, Dec. 4, 1827.

Roman Cement.—It has been discovered that the property this cement possesses, of setting under water, belongs to most calcareous stones.—To this effect, the stone must lose 8, 12, or 30 per cent. by calcination. What agrees with this idea is that chalk, feebly calcined, gives a mortar of this kind. Experiment has led to the presumption that Roman cements owe their property to a sub-carbonate of lime produced by fire on the natural carbonate. If this be true, Roman cement may be made in almost every place where limestone is found.—Balt. American.

From the National Enquirer.

The Vine.—About 150 acres are planted with grape vines, in York County, Pennsylvania. The average produce is equal to 15 barrels of wine from the acre.

Wool.—Three towns in Maine, containing about 5,000 inhabitants, and from 75 to 100 square miles of territory, wintered, last season, 11,731 sheep, producing 3 lbs. of wool each, and having 6,770 lambs this season. Some of those sheep are of the fine woolled breed. From various details it is believed that the sheep last winter, in Maine, amounted to between 800,000 and 1,000,000, and that the present stock is 1,300,000.

Mr Davis, in his speech in the House of Representatives, on the 31st January last, estimated that the amount of wool worked up was 32,000,000 lbs. and that 3,200,000 yards of broad, and 32,000,000 of narrow cloths were annually produced, and about 100,000 persons are directly or indirectly employed in this business. We gather from his opinion also, that more than 100 millions of capital were vested in the growth and manufacture of wool; and he put down the sheep at fifteen millions.

The island of "Rhode Island," 14 miles long and less than 3 wide, has more than 30,000 sheep upon it. There are about 200,000 in Berkshire county, Mass. Many in the western part of Virginia; one gentleman in Ohio county has more 3,000; he sold his crop of wool to Mr Rapp, at Economy, for \$2,400. There are in the State of N. York about four millions of sheep, between two and three millions in Pennsylvania, a million in Vermont, &c.

(From the Massachusetts Spy.)

FUEL.

The price of fuel in the country is becoming so disproportionate to the value of other commodities, as to render it a tax, onerous to every class in the community. It therefore becomes important to inquire into the causes of the enhanced value, and the means by which it can be rendered least burdensome. In the use of fuel, the evidences of waste and improvidence are more palpable, and more universal, than in any other branch of domestic economy. Hundreds and thousands of trees valuable for timber and fuel, are suffered to go to decay, and rot down, while the owner, at the same time, is cutting young, vigorous, and growing trees, because they happen to be a little more handy come at. But the greatest waste of fuel is in the attempt to keep rooms warm, which are so open as to afford but poor protection against the inclemency of the weather. The difference between a tight room, or an open one is too often overlooked. What people become familiar with, by habit is little thought of. How many there are, who live from season to season, for years together, in cold and uncomfortable apartments, which might be made tight and warm at less expence of money and labor, than would be required to cut the fuel which would thus be saved in a single season!—We hazard little in saying, that more than one third part of the fuel, now consumed, might be saved by paying more attention to excluding the cold atmosphere from without.

The early approach of winter admonishes us to attend to these things. Examine your rooms, and if the plastering is broken, let it be mended; if the wood work has shrunk from the plastering, let

the crevices be filled with putty; if a shingle or a clapboard is loose, let it be nailed on; and if one is missing, let its place be supplied by another. But above all, if you have broken windows, mend them. No person who ever buys ardent spirits, except for medicine, has the shadow of an apology for permitting his family to suffer with broken windows. The price of a single dram will buy a pane of glass, and half the time usually spent in procuring it, would be sufficient for setting the glass in a window.

Directions to prevent sickness.—1. As soon as you feel too unwell to attend to your ordinary business, lay it aside at once, and dismiss all care and anxiety about it; as rest and relaxation both of body and mind, are of the greatest consequence.

2. Observe a rigid abstinence as to diet, by eating no food, but that of the simplest and lightest kind; and no more than the appetite craves, which will not be much.

3. Avoid all kinds of spirit, wine, ale, and even cider. Dismiss care, but never attempt to drown it with stimulating liquors, unless you would increase the violence of your symptoms seven fold. It is surprising that so many should imbibe the absurd notion, that rum, wine, &c. are necessary in all manner of complaints.

4. Take no quack medicines, or any else, with the nature of which you are not well acquainted. These few simple directions will be proper in the commencement of nineteen twentieths of the diseases in this country, if taken as they rise; and if followed, will throw off a large portion of them and mitigate the rest, so that their courses will be milder and their terminations more favorable. Many diseases are rendered intractable, and many lives lost, by improper management during the first twenty-four hours of an illness, and before any medical assistance is deemed necessary.—Nothing is more incorrect or injurious, than the theory which advises sick persons to eat and drink as much as they can, in order to strengthen them. Weakness, to be sure, usually attends the attack of disease; but this weakness is not from exhaustion, or to be relieved by food or wine.

5. If after a fair trial of what is above recommended you are still unsuccessful in throwing off the disease, and find that you must be sick in good earnest, send for a physician who is worthy of your confidence, and follow his directions implicitly.—*Christian Adv. and Jour.*

Woman.—No description has been oftener attempted than that of a lovely and amiable woman; but description never yet conveyed an adequate idea of the excellence it would portray. It is not a bright eye, or fair skin, or dimpled cheek, or graceful air, that men most admire. It is that indescribable charm of purity, benignity, and sincerity, which is as it were, breathed over her blushing countenance, and embodied forth in her delicate form, that appeals directly to the heart—whispering to her admirer, that there is the being on whose fidelity he may securely rely; to whose tenderness he may always appeal—one who will love him through life, and weep over him in death, and forever be to his wild spirit, like the rainbow to the dark cloud—the harbinger of peace.

A cabbage weighing thirty-four pounds, was produced in Salem, the present season, in the garden of Col. Horatio Perry.

Lime will in all cases be most economically burned by fuel which produces little or no smoke, because the necessary mixture of the fuel with the broken limestone renders it impossible to bring it in contact with a red heat which may ignite the smoke. Dry fuel must also in all cases be more advantageous than moist fuel, because in the latter case a certain quantity of heat is lost in expelling the moisture in the form of vapour or smoke.

Receipt for de-training Rats.—Among the various means and other means of destroying these obnoxious animals, I have always found the following to be a most effective, but simple and harmless plan of ridding my premises of these vermin:—Take a few fresh corks, grind them down into small particles, fry them in the common way, with a little butter or fat; place it while warm, at the places where the rats assemble, and if possible, when they may eat the dose undisturbed by any noise; leave no water within their reach, and in a few days, not a vestige of the creatures is to be seen."

The Mayor of the city of Darien, Georgia, issued his Proclamation for the observance in that city of the 15th Nov. as a day of solemn Thanksgiving and Prayer, for the health experienced in that city through the past season. The custom originated in New England, and we are pleased to see that it has travelled so far south.

Dark Day.—Monday, the 12th day of November, is noticed in the Chillicothe (Ohio) paper, as having been so dark just before noon, that it was found difficult to read near the window; and candles were lighted at two or three o'clock in the afternoon.

It has been calculated that the manufacture of wool (including the various mechanics and laborers employed) in the New England States support about twenty thousand families, or 130,000 persons, and that these will consume the surplus products of forty thousand families of agriculturists; together about 360,000 individuals.

The people of Vermont are at present much interested in a project for connecting Lake Champlain with Connecticut river, by means of a Rail Road. It is thought that the subject will be brought up before the Legislature.

Economy.—The Trustees of the Lyceum of Gardiner, (Maine,) have made such arrangements, that all the scholars of that institution, (who are so disposed) may pay the whole of their expenses, by their own exertions in vacations.

DAMP WALLS.

A wall, of which the walls were constantly damp, though every means were employed to keep them dry, was intended to be pulled down, when Mr Schmittals recommended as a last resource, that the walls should be washed with sulphuric acid. It was done, and the deliquescent salts being decomposed by the acid, the walls dried, and the hair was afterwards free from dampness.—*Bul. d's Soc.*

The late Dr. Beddoes ascertained that butchers, who live more on animal food than other men, are rarely, if ever, liable to the disease of the lungs, termed pulmonary consumption.

Extracts from "An Address to the Society of the Counties of Hampshire, Franklin, and Devon, for the promotion of Agriculture and the Mechanic Arts. By Hon. MARK DOUGLASS." [Continued from page 146.]

We need not look abroad to witness the advance in the farmers' property, by reason of manufactures. We have seen it in this State, and within our own limits. In view of the growth of these establishments, a question has arisen—are not we in danger of a similar fate which attended the British manufactures? In answer to which, we say, our situation is totally different from theirs. Of the two millions of families which compose the population of England, (the population is somewhat larger than here assumed) about 750,000 are agriculturists, leaving 1,250,000 in trade, manufactures, professions, and other employments. In the United States, it was not long since calculated that ten sixteenths of our population were agriculturists; but suppose the number is not over nine sixteenths, it places us at a safe distance from the causes of their troubles.

A wise government will protect its own manufactures.—"It belongs to the real statesman," says Rousseau, "to elevate his views in the imposition of taxes above the mere object of finance, and convert them into useful regulations." If the evil cloud which now darkens the prospects of our manufacturers, arose from causes which were existing in their operations, it would deserve the serious consideration of government, whether sound policy did not demand an increase of duty on the importation of rival fabrics. The story that our woollen manufactures, for example, were suffered to languish under a tariff, falsely called a protecting duty, which secured the sale in our markets, of woollens from Great Britain, of more than ten million of dollars annually, would be reviled by those who should come after us, as a monument of lasting reproach to the government which should suffer it. But without further reference to government it is evidently left to us, as their increase and prosperity is sure, and that a period is not far distant when New England will be the southern and western America, what England for a long period has been to the eastern continent.

The increase of the paper expenses within this Commonwealth has gone far in advance of the ratio of the increase of population. From 1800 to 1820, while our population had increased but about one to four, our State paper account increased about twelve to four. Since then the weekly allowance for State papers has been diminished, which has diminished the amount of state charges, but the expenses upon the several towns are increasing continually. The whole amount paid is probably not much less than half a million. This is a subject in which the property and morals of the community are deeply involved. While viewing it every one will lament the existence of the great cause of pauperism in our country. Intemperance is the flood-gate which opens to it, and to every vice. It is lamentable, indeed, that in a land abounding with the blessings of providence, a class of men should be found branding themselves in a way appalling to every feeling of our nature, and that too against every restraint which moral considerations can interpose. To the common drunkard, warnings and reproofs are like words upon the desert air—

Host without a trace. Ministers may preach—moralists may write—the press with all its power, may lend its aid—moral societies may add their influence, and temperate societies their example, still the plague advances, and like the overflowing of mighty waters, is spreading its branches in every direction, regardless of every obstacle.

You may as well attempt to secure your property against the aggressions of the pilferer, or the implements of gaming from the hand of the gambler, as the intoxicating cup from the lips of the drunkard. Each of these, should alike be treated as violators of the rights of the community.

The law of the Commonwealth providing a penalty against common drunkards, which has been in your statute books nearly forty years, and enforced in some parts of the Commonwealth, has been but a dead letter with us. It has very seldom, if ever, been enforced within our limits. If you look at our jails, and our prisons, and inquire into the history of the wretched tenants, who inhabit those dreary and life-wasting receptacles, you will learn that in nine cases in ten, drunkenness was the door which opened upon them the chains that chain them there. Should each county within the Commonwealth be provided with a house of correction, suitably appended with land and workshops, and the law enforced against common drunkards, the public would soon find on their side their paper taxes saved, and a check found to that dangerous and wide spreading evil.

Every successful effort to restrain the vices which are abroad in the land—to promote industry—to retrench unnecessary expenses—to diffuse useful information to all classes of the people, should be placed among the items of capital in favor of the farming interest.

With our constant vigilance for the promotion of these objects, no community can expect continuing prosperity and happiness. To the promotion of these, the fathers of New England were distinguished for their attachment, and by an adherence to them, lived as blessings to successive generations. The dignity which they wore, was that which alone characterizes true greatness—an unobscured exertion for the benefit of their fellow-men. To this end, every enterprise was undertaken, and every achievement accomplished.—They had the foundation of a mighty empire, and through the veil of future years saw the magnificence of its superstructure. Their virtues were the best test of trials rendered them more conspicuously bright. Their religion was practical—not like the meteor which astounds for a moment and disappears, but like the sun, genial and uniform in its course. The inheritance they have left us seen, in all we have—in all we are. While the soil which they cultivated remains,—their labors and their virtues will never be forgotten.

POTATOES.

We recommend, from experience, the following directions for gathering and preserving potatoes, to all who desire to have them good. There is another plan, however, which might be practised upon a small scale, to have a few prime ones for family use in the spring, and that is, not to gather the potatoes in the fall, but to let them remain in the ground during the winter. If the patch be not flooded with water, and the potatoes have been planted a moderate depth, (for deep planting is always found to produce the sweetest

potatoes,) a few inches' additional earth, or an equivalent of litter spread over the rows, will protect them from the frost. Then take them up early in the spring before vegetation commences, and they will be found to possess, in an eminent degree, the sweet freshness of new potatoes.

GATHERING AND PRESERVING POTATOES.

Extracted from the Transactions of the Society of Arts in London:

The usual mode at present practising for endeavoring to preserve potatoes is to leave them after digging, exposed to sun and air to dry. This exposure generally causes them to have a bitter taste; and it may be remarked, that potatoes are never so sweet to the palate as when cooked immediately after digging. I find that when potatoes are left in large heaps or pits in the ground, that a fermentation takes place which destroys the sweetest flavour of the potatoes. In order to prevent that fermentation and to preserve them from losing the original fine and pleasant flavour, my plan is, (and which experience proves to me to have the desired effect) to have them packed in casks as they are digging from the ground, and to have the casks when the potatoes are piled in them, filled up with sand or earth, taking care that it is done as speedily as possible, and that all spaces in the cask of potatoes are filled up with earth or sand; the cask thus packed holds as many potatoes as it would, were no earth or sand used, and as the air is totally excluded, it cannot act on the potatoes and consequently no fermentation can take place.—*Penn. Gazette.*

THE POTATO.

Nothing gives us more pleasure than to be able, when a blessing our readers, to use the language of congratulation—to speak to them in terms of cheerfulness—to turn their attention to something which is the cause of thankfulness and rejoicing; not by the anticipation of a far distant and doubtful benefit, but by some lonely blessing which they are in the very act of enjoying. We cannot, therefore, refrain from expressing our satisfaction, not only at the abundance of the Potato crop, but the unrivalled excellence of the root. Last year a good potato was like a pearl of great price, very seldom to be met with; many were the domestic alterations upon the subject—the lord and master of the Wingham, insisting gravely that there must have been some fault in the boiling, while "My dear" as gravely protesting that the fault was in the Potato itself. We differ from the opinion of an English Editor who characterized Potatoes as an abundant mixture of mud and water; he must have been deficient in taste. This vegetable is the best fruit of our country—a material pillar of our prosperity: It should be lauded by Political Economists, and its praises should resound from every string of the provincial lyre; there is more solid inspiration, if rhymers did but know it, in half a peck of blue mass, than in all the blue eyes in the world. Therefore, we say again, we heartily congratulate the country on the unrivalled excellence of the crop, which bids fair to render even our beggars *mealy mouthed.*

[New Brunswick Courier.]

CATTLE.

At the late Cattle Show at Washington, in this state, some of the cattle exhibited were weighed, and their weight shows no trilling improvement in the breed of cattle in that quarter. A bull calf, 9

months old, weighed 781 lbs.; another, six months old, 700, and many others nearly equal to this.—A heifer, two and a half years old, 1232; a bull, 1488; a cow, 1438. All the specimens given, were, with the exception of one bull and some ewen, of the improved short horned breed.

Penn. Gazette.

BITES OF THE RATTLE-SNAKE.

An article has been published in several journals, giving the account of a remarkable cure of the bite of a Rattlesnake, by cupping with a common porter or black bottle. The plan resorted to was, to fill the bottle half full of spirits of Turpentine, made quite warm, and after scorching the wound made by the snake, to apply the mouth of the bottle to it, and then pour cold water on the bottle until perfectly cooled. It is said in the case above alluded to, that the patient was in the most excruciating agony, previous to the bottle being applied, but soon became easy, and fell into a sound sleep. The next day he was able to walk about and work as usual. Spirituous liquors of any kind, or even warm water, will do very well as a substitute for spirits of turpentine.

Penn. Gazette.

New York Branch of the Linnæan Society.—At a late meeting, Doctor Pascalis communicated the introduction and division of his work on the growth and culture of silk. The Doctor's treatise embraces not only the old and natural method of rearing silk-worms, but also the lately improved artificial system, by which the crops of the silk have been quadrupled. He takes upon himself the solution of a great problem, by proving that the silk-worm is a perfectly electrical insect; and can be managed under this *system* without probability of failure, so as to obtain its valuable produce.

The following particulars respecting the produce of an acre of land, were handed us by a gentleman from Simsbury, who assures it is correct.

Mr. B. Latham mowed from 1 acre a crop of clover July last 2 tons hay.—on the 1st of July, ploughed the same, and planted it with potatoes, and after hoeing the potatoes, rowed 2 Turnips among them. In the latter part of October he gathered 230 bushels Turnips and 150 bushels of Potatoes from the same land.—Hartford Times.

Cider Molasses.—While cider is so abundant as to be sold in Pennsylvania at 62½ cents, and in New England at 33 cents per barrel, why do not the farmers imitate some of their economical neighbors, and boil down the cider to molasses?—A barrel of the juice of good sweet apples, it is said, will produce three gallons of molasses, worth \$1.50, and excellent for most culinary purposes. People's Friend.

Remedy for poison.—The most efficacious remedy for the most active poison known in nature, is suction by the human mouth, in cases of wounds into which poison is injected, and which may be extended to those from the fangs of serpents, particularly from those of the rattlesnake—and, I have no doubt also, but that the same remedy would have equally beneficial results, if applied to wounds inflicted by dogs under the influence of hydrophobia. Colonel John Wharf, of Washington county, in Pennsylvania, sucked a wound on the foot of one of his sons, inflicted by a rattlesnake. A young woman within a quarter of a

mile of my father's house, performed a similar cure on the foot of her brother. In neither instance was the slightest inconvenience experienced, from the poison being received into the mouth, nor did the wounds amount to more than a suction, than a briar scratch would have produced. I mention these cases, as instances coming under my own eye. In fact, the North American savages are perfectly aware of the certain benefit of suction, but as well as the whites, are deterred, in many instances from its application from an apprehension of danger to the person who performs the humane act. I will not say, that in the performance of such an act, there is no danger—but I have known no serious consequences follow where it has been put into practice.

WILLIAM DARRY.

That the exercise of intellect is one means of prolonging human life is an incontestable truth.—The corporeal organ by which we perform the inexplicable functions of thought, is the brain. And it is a deliberate opinion of men, whose speculations have been turned to such topics, that nothing tends more directly to procure sound health and quiet days, than a due activity in the functions of the brain. We are assured by a learned writer, that there is no instance of longevity in a professed idler. The truth is, that whoever is regularly engaged on subjects requiring thought, has no leisure for indulging in any excess.

Three large Bulls, of the celebrated short horn breed, have arrived here in the ship Menour, from Philadelphia. We understand they were procured by J. Hare Pawel, Esq. for the South Carolina Agricultural Society, and with the honorable view of improving the breed of cattle in this state.

Charleston Courier.

A Florida paper says, "That a horrible state of things has existed for some time, and the first flagrant violation of law taken place in Tallahassee. That the civil authorities are frequently set at defiance." This deplorable state of things is fully accounted for in the subsequent paragraph.

Penn. Gazette.

The vice of drunkenness exists in this place, and almost throughout the District, to a most a horrible degree."

NEW ENGLAND FARMER.

BOSTON, FRIDAY, DEC. 7, 1847.

HORSE CHESNUT.

The Horse Chesnut, (*Aesculus hippocastanum*) is a magnificent and beautiful tree, when in May it is covered with its digitate foliage, and fine large spikes of white flowers. It is of rapid growth, and speedily produces a considerable bulk of timber; which, however, is of no great value, though some say it is as good as that of other chesnut. Being highly ornamental as a single tree, and in the out-skirts of plantations, it need never be planted in masses for timber. An English writer compared it, when in flower, to "a giant's nosegay." An objection to its culture in some situations, is, that "its leaves begin to drop early in summer, and make a litter round the trees, during the remainder of the season."

The horse chesnut requires a good and rather dry soil, and suffers materially from storms of every kind, when planted in exposed situation.—

Mr Mahon directs that the nuts should be planted about the middle of March. They should be sown in drills, first throwing the nuts into a tub of water, and repeating such of them as swim.—The drills may be three feet asunder, and the nuts planted about six or eight inches from one another in the rows, covering them with light rich mould about two inches deep. When these trees are transplanted, their roots should be preserved as entire as possible. They should be set in large holes, level with the surface of the ground, and the fibres being spread and covered with fine mould. They should then be tied to stakes to protect them from high winds and cattle, till large enough to defend themselves.

The fruit of the Horse Chesnut furnishes a grateful food to horses, and has been successfully employed for fattening cattle, the tallow of which renders uncommonly firm, especially when mixed with ground barley. The milk obtained from cows fed with it, is also said to be richer than that produced by any other aliment. The nuts have been used with advantage in feeding poultry; but they are unwholesome for dogs. Deer are peculiarly fond of this fruit; which has also been usefully substituted for soap; because on steeping and boiling it in water, it makes a good lather preparatory to the use of that more expensive article. In Turkey the nuts are ground and mixed with provender for horses, especially for those which are troubled with coughs, or broken winded, in both of which diseases they are accounted very good.

Rees's Cyclopedia, says, "The common horse chesnut is propagated by sowing the nuts, after preserving them in sand during the winter, in order to prevent their rotting in the spring. The horse chesnut has been employed in France and Switzerland, for the purpose of breeding yarn; and it is recommended in the Memoir of the Society of Berns, Vol. II. part I.—as capable of extensive use in whitening not only flax and hemp, but silk and wool. It contains an extremely saponaceous juice, which is obtained by soaking the nuts and rasping them. They are then allowed with hot rain or running water, in the proportion of twenty nuts to ten or twelve quarts of water. Wove caps and stockings were milled in this water, and took the dye extremely well; and successful trials were made of it in filling stuffs and cloths. Linen washed in this water takes a pleasing light sky blue color; and the filaments of heap, steeped in it some days, were easily so dyed." The author of the memoir above referred to, imagines that if the meal of the chesnuts could be made into cakes or balls, it would answer the purpose of soap in washing and felling. The sediment, after infusion, loses its bitter taste, and becomes good food for fowls when mixed with bran.

BUTTER IN COLD WEATHER.

In order to make butter in cold weather, it is recommended to pour as much boiling water into the cream as will bring it to the temperature of milk just from the cow. Cream so managed, it is said, will require very little churning, and no disadvantage accrues except that the butter will be white for a day or two.

In Scotland, dairy women give their butter a fine yellow color, by grating some orange carrots, straining the juice, and mixing it with the cream previous to churning. Butter, thus made, not only acquires a beautiful yellow color, but a flavor

which adds greatly to its value. The quantity of carrot juice to be added, must be ascertained by experiment, and the judgment of the manufacturer. Feeding cows with carrots, will have a similar effect, and answer a better purpose than mixing the carrot juice with the cream.

E. H. Perly, Esq. of Salem, Mass. recommends making butter by the aid of frost, as follows:—“The milk when taken from the cows is immediately strained into earthen pans, and set in the coldest part of the house; as soon as the frost begins to operate, a separation takes place, the cream rises in a thick paste to the top, and leaves the milk without a particle of cream, frozen in the pan. The cream is not so hard but that it can be easily scraped off with a spoon, to the solid ice; it is then set aside until a sufficient quantity is collected for churning, when it is warmed just so much, as to thaw the cream sufficiently to put it into the churn. I have never known it to require more than five minutes to convert such cream into butter, after the churning had commenced.”

If you feed your milk cows with roots, cabbages, or other nourishing food, you may continue to make butter during the winter; and may, perhaps, derive some advantage from the above directions.

METHOD OF POLISHING OR CLEANING A STOVE.

Take one quarter of a pound of black lead, mix it with water, then put it on the stove, with a point brush, and after it is perfectly dry, take a stiff brush to it, which in a few minutes will produce a handsome polish.

REMARKS ON THE MOON, WEATHER, &c.

It is generally known, that the moon appears new or full, by our seeing that part of her which the sun shines upon; and I think that the borrowed light of the sun has no influence on the earth when coming from the moon, either as it regards the weather, or the growth of vegetation, or of peeling of bark or cutting of timber, to make it durable, or any other similar whim.

The sun and moon attract the sea, and cause the tides to ebb and flow; but the *shining* of the moon makes no difference. When the moon is new or full, we have higher tides, for the sun has nearly an equal effect in both cases.

Clouds running in opposite directions indicate falling weather. It has been said, that thunder storms go against the wind, and that other storms do not. But it is a fact that long storms progress directly against the wind that blows near the earth. The upper wind carries the main cloud, while the lower wind drives under-riding clouds in quick succession, which help fill up and continue the storm, and when it is ended the wind generally blows the same way near the earth that the main cloud came from. Northeast storms, as we generally term them, begin at the southwest; and southeasterly storms generally begin at the northwest, and they travel from 120 to 1300 miles in twenty-four hours.

A heavy fog will be seen in the south east 24 hours before a northeast snow storm. A cloud will be seen in the northwest from six to eight hours before a southeast storm. And a southeast wind on our coast will generally produce rain in fifteen or twenty hours. When uncommon birds are heard to make a noise, and the brute creation, as well as winged fowls, appear to be more active than usual, then look out for rain. I

have heard shepherds say that sheep, and especially lambs, are the most active before a rain.—When drops of water appear on a white stone, or on a cup of water, or any cold substance, then look out for rain; for these signs show the air to be full of moisture. When no dew is seen on the grass in the morning, then we may suppose the moisture is gathering in the clouds for rain.

The falling of snow in a particular time of the moon, is no sign of its durability. But any whim, well stuck to, will generally satisfy some persons; for if it turns out otherwise, it is easy to impute it to some unknown cause. One woman told the weather by observing which way the old sow rooted, and which way a cat turned herself to the fire. One woman thought her fatirons did not hold heat well, because they were cast in a wrong time of the moon. I have seen publications in favor of cutting timber, at a particular time of the moon, but I am well satisfied that the moon's being either new or old makes no difference in the cutting of timber. But the shining of the moon is of great use to give light to those who happen to be out in moonlight evenings; and as we have the light of the moon about half the evenings in the year. I have thought it might be well to appoint such public meetings as we wish to have in the evenings, on moonlight nights; for sometimes accidents happen to those who choose darkness rather than light, even if their deeds are not evil.

I have written down the weather for years past, and then compared my memorandum with the changes of the moon, and did not find them to correspond with the generally received opinions of mankind. Many people suppose that the last Friday in the month is an almanac for the next month; but it does not appear to me very likely that the weather is made to conform to our mode of counting time. Others suppose that the 12 days after Christmas is an almanac for the 12 months of the next year; or that the wind will blow the same way each month as it blew on each of those days;—but they all appear to me alike ridiculous.

American Sentinel.

PUNCTUALITY.

When Gen. Washington assigned to meet Congress at noon, he never failed to be passing the door of the hall while the clock was striking 12. Whether his guests were present or not, he always dined at four. Not infrequently new members of Congress, who were invited to dine with him, delayed until dinner was half over; and he would then remark, “Gentlemen, we are punctual here. My cook never asks whether the company has arrived, but whether the time has.” When he visited Boston in 1789, he appointed 8 A. M. as the hour when he should set out for Salem; and while the Old South clock was striking eight, he was mounting his horse. The company of cavalry, which volunteered to escort him, were parading in Tremont street, after his departure; and it was not until the President reached Charles River Bridge, that they overtook him. On the arrival of the Corps, the President with perfect good nature, said, “Major, I thought you had been so long in my family, not to know when it was eight o'clock.”

Capt. Pease, the father of the Stage Establishment in the U. S. had a beautiful pair of horses which he wished to dispose of to the President, whom he knew to be an excellent judge of horses. The President appointed 5 o'clock in the morning

to examine them. But the Captain did not arrive with the horses until a quarter after five, when he was told by the groom, that the President was there at five, and was then fulfilling other engagements. Pease, much mortified, was obliged to wait a week, for another opportunity, merely for delaying the first quarter of an hour.

[From the *Bellevue Falls Intelligencer.*]

EDIBLE BIRDS' NESTS.

MR. ERROR.—I noticed in one of your papers a short time since, a paragraph on the use of birds' nests as an article of food among the Chinese,—which seems to display no little incredulity on the subject. But the fact is as stated, that they do actually use them in that manner, and not only so, but account them great luxuries and pay a very extraordinary price for them.

It must not be imagined, however, that these birds' nests are such as we see in our own country; a collection of horse hair, straw, threads, sticks, moss, dead leaves, thistles, down, and the like, a composition which doubtless would suit the Chinese palate little better than our own. On the contrary, the edible birds' nests, (as they are called) are composed of what, upon external examination, appears to be a sort of gum, which by boiling, dissolves in water, imparts to it the properties of this jelly and highly nutritious qualities, and when properly seasoned with spice, &c. is extremely grateful to the taste, resembling, in short, our animal jellies, or in some manner, those farinaceous preparations such as arrow-root, sago, tapioca sales, which are used as extremely delicate articles of nourishment for the sick.

These birds' nests are comparatively very scarce, being formed only by one peculiar species of birds, belonging, (as I think,) to the swallow or martin tribe, and are obtained almost if not quite wholly from a single Island in the Chinese seas, one of the Formosa Islands, if I recollect rightly. In this Island which is little better than an abrupt mass of rocks rising out of the ocean, are large caverns in the cliffs, to which these birds resort for the purpose of propagation. Against the wall of these caverns they fix their nests, which are formed out of a peculiar gelatinous substance produced from their own bodies, much as the bee forms its cells of the wax also so produced, or at least prepared.

After the period of hatching is past, and the young birds are become able to fly, the caves are visited by the islanders, who strip them of the nests of which they make an article of traffic with the Chinese, who send vessels for the purpose of procuring them. As only twenty or thirty thousand of these nests are procured each year, and as they are looked upon as articles of great luxury by the Chinese, their price is proportionably high; and the material of which they are composed being extremely light, we may well believe what is asserted, that they are frequently sold in the Chinese market for their weight in gold. This indeed, would not be a higher price in proportion, than is frequently paid in England, and occasionally in some parts of our own country, for luxuries of the table; such as the first ripe cherries at a guinea a pint, or the first fresh salmon at two dollars a pound.

The birds by which this singular kind of nest is fabricated, are birds of passage, visiting the island only at a certain time in each year. One or two of them were a few years since procured,

and sent to England together with one of their nests, to the distinguished naturalist and anatomist, Sir Everard Home. The nest was found to be composed of gelatine or the basis of animal jelly, with some peculiarities of odour and flavor, it having been previously ascertained that this substance was discharged from the mouths of the birds, dissection revealed to him its source in certain glands, situated in the neck of the bird, and opening by appropriate secretory orifices into the throat.

This account, which is believed to be substantially correct, will, it is hoped, dissipate any doubt upon the subject. NATURALIST.

Sir William Onslow, in his interesting *Travels in the East*, describes the punishments inflicted on robbers in Shiraz, as severe in the extreme.—In one instance, "a barrel or vessel filled with powder, which being ignited by means of a long train, blew to atoms a robber that had been previously fastened to it." "To immure them alive is a frequent punishment; of this many instances may be adduced, and confirmed by indisputable evidence." "From this place to Abor," says Dr. Fryer, in 1678, "both in the highways, and on the high mountains, were frequent monuments of thieves immured, in terror of those who might commit the like offence; they have literally a stone doublet: whereas we say metaphorically, when any is in prison, *He has a stone doublet on*; for these are plastered up, all but their heads, in a round stone tomb, which are left out, not out of kindness, but to expose them to the injury of the weather, and assaults of birds of prey, who wreak their rapine with as little remorse as they did devour their fellow subjects." Mr. McDonald, in his *Geographical Memoir*, says, "The body of the culprit is sometimes torn asunder by being bound to branches of trees, afterwards separated; and I do remember having once seen four thieves built into a wall, (all but their heads) and thus left to perish."

Substitute for Arrow-root.—An article copied from a Scotch paper, recommending the use of potatoes as a substitute for arrow-root, is taking the round of the press. The writer states, "that the farina of the potatoe is equally nutritious with arrow-root." This is quite erroneous. It does not contain a fourth of the nutritive property of pure arrow-root, and from its ascendent tendency is highly unfit for weak stomachs. Much of the arrow-root now in the market, is adulterated with potatoe flour. The best test for arrow-root, is to let it stand for two days after it has been made, and then examine whether its gelatinous appearance has been altered. If potatoe flour has formed part of the mixture, the jelly will have turned to water and become sour. Pure arrow-root retains its gelatinous consistency for several days, and does not become sour like the farina of potatoes.—*Eng. paper.*

Worcester Coal Mine.—We learn that a wealthy and enterprising gentleman from Boston, has become interested in the Worcester Coal mine, and that he will commence working it soon. We may therefore expect that it will be so thoroughly explored, as to determine whether coal of a better quality than has been heretofore obtained, may be found there: and, if there cannot, that means will be devised to ascertain the most profitable use of such as may be procured.—*Worc. pa.*

Cannibal Epicurism.—A savage belonging to St. Vincent's, showed me the foot of an "Alouague," which he had in his basket. He only ate Alouagues, who are savages from the Main, near the Oronoco. They say that Christians give them the colic. They had, nevertheless, within the year, eaten the heart of an Englishman.—*Southey's Chronological Hist. of the West Indies.*

Power of the King limited by Parliament.—Sir John Coventry, K. B. an independent member of the House of Commons, in the reign of Charles II. in a debate on the propriety of the tax on playhouses, made some sarcastic allusions to the King, who, in consequence, ordered some of the Guards to way-lay Coventry, and set some mark upon him. In consequence of this order he was seized, and his nose split to the bone. The outrage was highly resented by Parliament, who passed what is called the Coventry Act, by which the punishment of death was awarded against all who should, in future, "maliciously maim or dismember another." They inserted a clause in this act, "That it should not be in the King's power to pardon the offenders."—Abridged from the History and Antiquities of London, see *London Weekly Review* of September 1, 1827.

Extract of a letter from an American Gentleman at present travelling in England, dated Sept. 30.

A few days since I visited the Tunnel under the Thames, which is one of the most gratifying curiosities I have seen in London. It is about 3 miles below the London Bridge, and on the Kent side of the River. We first descended the shaft, a tremendous cavity in the earth, about 100 feet deep; and then proceeded through one of the arched passage ways, which was beautifully lit up with gas. We passed to the extreme end, where the workmen are employed,—565 feet from the shaft, and of course a considerable distance under the river, and which I believe to be about half across. As yet they had not re-commenced their work of boring, but they expect to do so in a few days, as the break in the river is completely stopped, and the Tunnel free from water. The Steam Engine down the shaft, draws away the dirt in carts, as fast as the workmen fill them by the other Arch way, which is laid with a Rail Road. I have great confidence in its success, for what is there that men cannot do, when they have at their disposal plenty of money and plenty of force.

On the same day we visited the Tower, and inspected every thing it contained. The Armory which can contain 300,000 stand of arms, was a magnificent spectacle; and a sight of the crown jewels was truly dazzling. The present King's crown is valued at £1,000,000 without the precious ruby, which is above all price.

Among the astonishing wonders of the age, there is actually in existence a Steam Carriage, which was put into operation a few days since in the Regent's Park and elsewhere. It goes up hill at the rate of five miles an hour, and on a level, of fourteen: down hill it goes too fast—so much so, that the man who had care of the wheels forgetting to lock them, one of them flew off, but did not upset the vehicle, which alone is a great advantage over machines drawn by "bits of bloods." They are now finishing on a larger scale.—When the accident above mentioned happened, there were twenty persons in the carriage.

Trees, Ornamental Shrubs, &c.
MR WINSHOP offers for sale at his Nursery, in Brighton the largest variety of Fruit and Ornamental Trees, Shrubs, &c His collection of Fruit Trees is large and well selected; and his variety of Ornamental Shrubs is very extensive, comprising the Rose Acacia, Three thorned Acacia, Gum Acacia, double flow'ring Almonds, red and white Albrees, Bladday nut tree, Bigonia Rachen, Burning Bush, dwarf flowering Horse Chestnut, splendid flower'ng Catalpas, Dahlias, Opaline Pink Nazouco (first flowering shrub) variety of Grapes, variety of Honey-suckle, English walnuts, Weeping Willows, Quinces, Stragles, Laburnum, Snowballs, Rhodod., Raspberries, Plums, Peach nut-trees, Mountain Ash, Limes, Larkspur grandiflora, Japan pear Japonica chlororrhous, &c.—Orders for any of these articles left with Mr RUSSELL, at the New England Farmer office, will be executed on the same terms as at the nursery, and delivered in Boston, free of expense.—Catalogues furnished gratis.

Breeds Geese.
FOR sale, 10 pair superior BREMEN GEESSE. Apply to THOMAS WILLIAMS, Noddle's Island, or to Mr RUSSELL, at the New England Farmer office. Dec 7.

For Sale.
TWO large, well formed and powerful mares, with foal by the celebrated imported horse *Belmonte*. These animals are perfectly broke to the saddle and all kinds of harness, well broken before oxen, and are perfectly kind and good travellers. To persons wanting mares to breed from, this offers an opportunity not often met with.—Also 2 pair of WILD GEESSE. Apply to BENJ. ACSTIN, near Mr Greenwood's meetinghouse in Newton, or to J. B. RUSSELL, at the New England Farmer office, Boston. Dec 7.

MISCELLANIES.

The following had cross passage we have extracted from a Poem, written by Grayson Carter, and entitled "Voyage to Ireland, in Burlesque." Mr. Campbell, in his specimen of English Poetry, makes some quotations from the poem, but omits and omits, and probably furnished the line of the peculiar style, spirit, and manner of the "Poet." The adventures of Dr. Scurvy, are all related in verse of a smaller nature.

THE HORSE AND THE RIDER

It certainly was the most ugly of asses,
His hips and his hump, and his right eye of Spanish
His sides were two halves, well spring-galled with
His neck was a D-bone, and his head was a Mule
For his color, my pains and your trouble I spare,
For the creature was wholly denuded of hair,
And except for two things he bore as my nod,
With a tail of a Mule, and a prig of a Fool.

Now such as the first was, even such was the rider,
With a head like a Nutmeg, and legs like a Spider,
A nose like a Cricket, a look like a Rat,
The brains of a Goose, and the heart of a Cat,
Even such was my Giddy, and his best friend,
The one for a Horse, the other an Ass.

Opera Dancers.—The walk of opera dancers is neither natural nor beautiful; but the surprising exercises they perform, give to the joints of the foot a freedom of motion almost like that of the hand. We have seen the dancers, in their morning exercises, stand for twenty minutes on the extremities of their toes; after which the effort is to bend the inner ankle down to the floor, in preparation for the *bore* step. By such unnatural postures and exercises the foot is made unfit for walking, as may be observed in many of the retired dancers on old *Opéras*. By standing so much upon the toes the human foot is converted to something more resembling that of a quadruped, where the heel never reaches the ground, and where the paw is nothing more than the phalanges of the toes.—*Treatise on Animal Mechanics; Library of Useful Knowledge.*

Lord Commissioner Stuyvesant was a very old man when he waited upon the Prince of Orange (William III.) to congratulate him on his safe arrival in England. "Sir," said the Prince, "you must have survived all the great lawyers of your time."—"I should, sir," replied he, "have outlived the law too, had not your Royal Highness visited me in my kingdom."

A good shot.—"It is now," said Van Wyk, "more than ten years since, in the very place where we now sit, I ventured to take one of the most arising shots that ever was heard of. My wife was sitting within the house near the door, the children were playing about her, and I was without, busied in doing something to a wagon, when suddenly, though it was mid-day, an enormous lion appeared, came up, and laid himself quietly down in the shade, upon the very three-

hold of the door!—My wife, either frozen with fear, or aware of the danger attending any attempt to fly, remained motionless in her place—while the children took refuge in her lap. The cry they uttered attracted my attention, and I hastened towards the door; but my astonishment may well be conceived, when I found the entrance to it barred in such a way. Although the animal had not seen me, unarm'd as I was, escape seemed impossible!—yet I chafed gently, secretly knowing what I meant to do, to the side of the house, up to the window of my chamber, where I knew my loaded gun was standing. By a most happy chance, I had set it in the corner close by the window, so that I could reach it with my hand; far, as you may perceive, the opening is too small to admit of my having got in; and, still more fortunately the door of the room was open, so that I could see the whole danger of the scene. The lion was beginning to move, perhaps with the intention of making a spring. There was no longer any time to think. I called softly to the mother not to be alarmed, and in making the name of the Lord, fired my piece. The ball passed directly over the hair of my boy's head, and lodged in the forehead of the lion immediately above his eyes, which shot forth, as it were, sparks of fire, and stretched him on the ground, so that he never stirred more.—*Lichtenstein's Travels to South Africa.*

The late Rev. R. Cecil, when conversing with a friend upon the distinguishing traits in the female character, observed "that to reason with a woman was generally useless; the feminine mind is not composed of logical materials; indeed, I believe the true definition of a woman is—a bundle of sympathies."

Expansion of Solids by Heat.—A remarkable instance of the use of the power with which solids expand by heat, occurred in Paris some years since in a method which was used to force down the walls of a gallery in the Abbey of *St. Martin*, over the *Conservatoire des Arts et Metiers*. The weight of the roof was forcing the walls of this building asunder, and they were restored to their perpendicular position by the following method:—Holes were made at opposite points, in several parts in the walls, through which strong iron bars were introduced, so as to extend across the building, and so that their extremities should extend beyond the walls; large nuts were placed upon their ends, and screwed up so as to press upon the walls.—Every alternate bar was heated by powerful lamps, so that its length increased by expansion, and the nuts, before in close contact with the walls, retired to some distance from them. The nuts were then screwed up to the walls, and the bars cooled. The process of cooling restored the length of the bars to what it had been before the heat had been applied, and the nuts were drawn together by an irresistible force, and consequently the wall drawn toward each other. The same process being repeated with the intermediate bars, and the same continued, the walls of the building were gradually restored to their perpendicular position.—*London Mech. Mag.*

New York Horticultural Society.—At a meeting of the Inspecting Committee, November 23, 1847, Mr. Fick presented six Down-head Calabres, weighing seventy-four pounds. The stalks were cut close as customary, and an unusual number of

out side leaves. Mr. Floy, three Savoy, seventeen pounds 13 ounces. Mr. Parmentier, a Sealing Apple from Newburgh, handsome shape, 1 1/2 inches in circumference.—*N. Y. Farmer.*

At the Farmer's Cattle Show and Exhibition of Domestic Manufactures, at Turkey Hills, Granby, Connecticut, Oct. 24th, the committee state that they deem it worthy of particular notice, that an apple was presented them by Isaac P. Owen, the one half of which was sweet; the other sour, both of an excellent flavor, maintaining their distinct characters to an exact line of division, perceivable only by taste. [This is not an uncommon occurrence.—See New England Farmer, vol. iii. page 261.]

Fruit Trees.
W. H. PRINCE, the proprietor of the *Linnæus Botanic Garden and Nursery*, at Easting, L. I. has a large collection of interesting plants, and has arranged them in a new catalogue, which contains 172 varieties of the Apple, 302 of Pear, 100 of Cherries, 140 of Plums, 250 of Apricots, 63 of Peaches, 100 of Quinces, 100 of Currants, 11 of Raspberries, 17 of Gooseberries, 10 of Strawberries, 25 of Grapes, 600 of Ornamental Trees, &c. Above 1700 of the above kinds of Fruits are not to be found in any other collection in America. The trees are all well established, and ready to be sent, as they are, or with a good quantity of soil, or in pots, as the subscriber may prefer, and nearly all the kinds are more than 1000 feet high trees. The Cherries, Peaches, and other trees are generally of large size. Catalogues may be obtained at the New England Farmer's Office, and orders left there or sent by mail, will meet attention.

JA. YES. BLOODGOOD & Co's.
Nursery, at Easting, on Long-Island near New York.

IN behalf of the proprietors of the above nursery, the subscriber solicits the orders of horticulturists who may be desirous of stocking their gardens and fields with fruit trees of the finest sorts, and most healthy and vigorous, at the present season. The subscribers are, and are anxious to be, in the possession of a large and extensive collection of all the varieties of all the fruit trees, and purchasers may rely with confidence that the trees they order will prove genuine. The subscriber, agent of the above nursery, will receive orders for any quantity of FRUIT AND FOREST TREES, FLOWERING SHRUBS, PLANTS.

And the trees will be delivered in this city at the risk and expense of the Purchaser; the bill may be paid to him. The reputation of this nursery is so extensively known and has been so well sustained, that I take leave to refer those in want of trees to any of the Horticulturists in this city, and its vicinity, and if peculiar directions are desired, I invite those who wish to be thus supplied to examine the trees in my garden at Bellerose, procured from the nursery for three or four years past, some of which are now in bearing, all in a healthy and vigorous state.

Catalogues will be delivered gratis on application to
Z. C. COOK, Jr.
Rogers' Publishing Congress-Street.

New England Farmer's Almanack for 1848.
Just published at the New England Farmer's Office, and for sale by Burt & Brainerd, 21 Wall-street, New York, and at the Booksellers generally, the *New England Farmer's Almanack* for 1848. By Thomas G. F. Selden, Editor of the New England Farmer.

Beehive Case.
For sale, a pair of this superior kind of Cases; they are decidedly superior to the common kind, and of the great size they afford the facility with which they may be raised, and in the compact yet small plan of arrangement required to fatten them.—Enquire at this office.

Nut of a Shipwreck.
THE *Shipwreck* of the New England Farmer, 50 of the above kind of Cases, and 100 of the same kind.—This fine Case was first made by the late Professor Owen, Professor of Mathematics in the University of Cambridge, and it travels into the interior of the Island of France. It is usually called by the Painters, the *Double Bottom Case*. Its Plan is represented to be simple and elegant, and very useful, by the English and American Builders in the present season. It is perfectly hardy, and gives a very much improved effect. A full description may be found in the *Transactions* of Professor Nuttall. It has a new resemblance to the Olive Tree.

The *Almanack* is published every Friday, at \$3.00 per annum, or \$1.50 paid in advance. Gentlemen who procure five responsible subscribers, are entitled to a sixth year gratis.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. PERRIN, Editor.

VOL. VI.

BOSTON, FRIDAY, DECEMBER 14, 1827.

No. 21.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

LARGE CATTLE.

The large oxen belonging to Capt. Benjamin B. Howard of West Bridgewater, which took the first and second premiums, at the late Cattle Show of the Plymouth County Agricultural Society, were butchered on Saturday last. They weighed as follows, viz:

Broad-horned Ox	1st fore quarter	322 lbs.
"	" 2d do do	316
"	" 1st hind do	321
"	" 2d do do	316
"	" Hide	161
"	" Tallow	235
Total		1701 lbs.
Red Ox	1st fore quarter	313 lbs.
"	" 2d do do	306
"	" 1st hind do	306
"	" 2d do do	301
"	" Hide	171
"	" Tallow	194
Total		1591 lbs.
Total weight of both oxen		3292 lbs.

These oxen were purchased last December, for forty dollars. They were fattened at great expense, and sold to Mr Oliver Ames, of Easton, for seven dollars a hundred.

We cannot resist the temptation, furnished by the present occasion, to remark, in relation to the subject of beef, that it appears to us astonishing, that of those who purchase neat stock to fatten, so many should be found, who are influenced in their selections generally, more by low prices, than by good dispositions and fair qualities; even when these are so obvious as not to be unobserved. These, however, ought to be the governing principles by which all such selections should be made.

The grand object of every farmer in making beef should be, to make good beef at little expense. And in order to accomplish this, in the highest degree, it is necessary, in our opinion, that the animals of which it is to be made should always have been kept in high flesh, that they be thrifty, have but little effal, and what perhaps is most important, that they be naturally induced to fatten easily. Now, how far the internal dispositions of neat stock are indicated, by their external qualities, we shall not undertake to say; and, still less, what the particular configuration and feel ought to be. It is enough for our purpose to remark, that there is an intimate connexion between them; and that this connexion is sufficient to form the basis, generally speaking, of a correct judgement. Most farmers, perhaps, can form a pretty shrewd guess as to the natural disposition of an animal submitted to their inspection, by his sensible qualities. But this is not enough; we would have them exercise more philosophy on the subject, and by availing themselves of acquired facts, make up their judgements according to established principles.

II.

December 3, 1827.

FARMING.

If as great improvements were made in agriculture as in the mechanic arts (and the present modes of cultivating the earth are undoubtedly susceptible of great improvement) the business of farmers would become, if it is not now, one of the most profitable that is pursued. There is no opinion more mistaken we apprehend, than that which is very extensively entertained, that there is nothing to be learnt in agriculture. A knowledge of the nature of the different kinds of soil and manure and the adaptation of the different products to them, are unquestionably as necessary, for success, to the farmer, as a knowledge of the fitness and relation of things to each other, are necessary in other branches of business. In illustration and proof of these observations, we make the extract below, shewing the yearly expense and income of a well cultivated farm of about forty acres.

The Agricultural Society of the county of Plymouth offered a premium the last year of 50 dollars for the best cultivated farm in the county. There were two claimants for the premium, viz. Mr Alpheus Forbes of Bridgewater (who is highly commended for his skill and industry in the management of his farm) and Rev. Morrill Allen of Pembroke, to whom the premium was awarded.—The following is a statement of the expenses and income of Mr Allen's farm which but a few years ago it is stated, "yielded little else than briars and thorns."

EXPENSE OF FARM.		
Seed used and manure purchased		\$35 00
The labor of one man at 20 dollars per month, board included, three months and three quarters		75 00
The labor of a lad at 16 dollars, seven months		112 00
22½ days' labor hired at \$1 25 cts. per day		31 12
20 days' labor at 92 cts. per day		18 40
Use of farming tools		10 40
Use of oxen		50 00
My own time and attention in directing the course of business		50 00
If the farm were subject to taxation, the four lots which have been described would probably be assessed about		25 00
Labor on lot No. 4		10 00
Manure made by the stock		25 00
		\$311 12

FARM CR.

The absences of the monthly laborers are put to the credit of the farm at the monthly wages.		
The man at \$20 per month, 36 days		27 50
The lad at \$16 per month, 33 days		20 13
52½ bushels oats at 42 cts.		22 47
¾ ton of oats cut in milk		2 50
33½ tons hay at \$12		405 00
5 do. do.	9	15 00
5 do. do.	7	35 00
14 2-5 do.	6	86 40
1½ second crop	8	14 90
1½ ton oat straw		6 00
19½ bushels of rye		19 50

Straw of rye	3 00
80 bushels and 19 7-8ths of corn	20 24
162 lbs. potatoes at 25 cts.	40 50
Corn fodder	10 00
Fall feed	25 00
Garden vegetables	20 00
Apples and pears	15 00

\$878 10

AMERICAN BUTTONS.

A manufactory of buttons established in Attleborough, Mass. by Messrs. R. Robinson & Co. appears to be in a highly prosperous condition. The Editor of the *Microcosm*, a paper printed in Providence, has published a long article stating the obstacles which the proprietors encountered at the commencement of their undertaking, and eulogising the industry, ingenuity and perseverance which enabled them to overcome every impediment, &c. He asserts that the Attleborough Buttons now stand higher in the market in the estimation of purchasers than any that are imported. It is said in fact that the imported article had become so depreciated in quality, that the button was but little better than a brass surface, while those of the Robinson manufacture have invariably proved to be every thing promised. The manufacture of American buttons, consequently, not only renders our own market independent in a considerable degree of foreign supply, but serves as a check to the introduction of a spurious article.

Buttons worn in the United States.—There are ten millions of people in the United States, half of which, setting aside fractions, are males. Of this, at the lowest rough estimate, one third, or say 650,000 wear metal buttons, and will average two suits a year, thus requiring an annual supply of thirty-seven millions six hundred thousand buttons, equal to 316,667 gross! This calculation is not susceptible of mathematical accuracy, and is merely amusing as furnishing a rough estimate of the labours and expense necessary to be applied to the manufacture of a button. The making of a pin might lead to a similar calculation, and shows the immense field there is for the employment of ingenuity, skill and labor.—*Microcosm.*

Winter Scenery in Scotland.—I do not think I ever saw this place look more beautiful—no, not in the leafy month of June." When one looks down in the morning from the Queen's Tower, you cannot picture to yourself a more lovely phenomenon than the tops of the trees. They are all spread over with a coating of frost-work—every little twig is feathered as delicately as if it had cost a fairy milliner a night's hard work to adorn it. The tall black trunks rise like ebony pillars amidst and beneath glorious canopies of alabaster, and the water being hard bound, and the mill silent, no sound is heard all around, except the eternal cawing of the rooks from those innumerable nests on which my window looks down."

Eltrick Shepherd.

Charities of the Season.—If the farmer thinks it his duty, as well as his interest, to take care of his very cattle, and see them well housed, how much more incumbent is it upon the rich to look

after their poor fellow creatures and see what can be done to secure them the common necessaries of meat, clothes and fire. The greater enjoyment of which man is capable results from the consciousness of having furnished the means of enjoyment to others.

TO REMOVE ICE IN CANALS, &c.

A gentleman in this city has put into our hands the following letter from a person in New York. The experiment which the writer proposes is at least worthy of consideration and trial.

"As it may occur in a day or two that you may be again incommoded by ice in the river from your city to the overslaugh in the basin, and in the canal, I beg leave to point out to you an experiment that I made with success in Gothenburg in Sweden. I was a passenger in a packet bound to England, that was frozen up, and while 100 men were sawing her out, I took a tin canister, containing about a pound of powder, and introduced into the neck a tin pipe, which was filled with powder, and fastened to it a pole about 6 feet long. The ice was about 2½ feet thick, into which I cut a hole, and introduced the flask. After pushing it under the ice to the end of the tube, I placed a match into it, and when it exploded, it broke up into small pieces half an acre of ice.

"My opinion is, that if the canal is frozen, one, two or six inches, so that it is free of holes and tight in the sides, that a gill of powder, placed even ten, fifty, or one hundred yards, would completely break it up, so that a boat could pass. If you have a glass factory near, I am of opinion that bottles or tubes, suitable for this purpose, could be blown for a trifling expense, from six to eighteen inches long. I mention this mode, as they would be water-tight and easily filled.

"As the benefit will be very great, and as the experiment can be made with a trifling expense, I shall be pleased to learn that a trial has been made, and that it has succeeded."—*M. Y. Eng.*

CATTLE SHOW AND FAIR AT WINDSOR.

The Farmers' annual exchange Cattle Show and Fair was attended at Windsor, Broad-street, on the 1st of November. From the Reports of the Committees, it appeared that there were more than three hundred head of neat cattle on the green; of this number, two hundred and four were in yokes. They were generally in fine order, and no previous exhibition has there been so large a number of beautiful working oxen collected together.

The first and best of cattle, five years of age, were owned by Henry Spencer; second best, by Hezekiah Brainerd; third best, by Hezekiah Mills.

The best pair of four years old, were owned by Jasper Morgan; second best, by Isaac Hayden; third best, by Elisha N. Still.

The best pair of three years old steers, were owned by Henry Spencer; second best, by J. Barker; third best, by Elisha Mills.

The best pair of two years old, were owned by Martin Ellsworth; second best, by Saml. Phelps; third best, by Elisha Mills, Jr.

The best pair of yearlings, were owned by Elisha Loomis; second best, by Nathan Brown; third best, by Jasper Morgan.

The best bull, the celebrated Holderness, was owned by Mr. Watson.

The best calf, by Elisha N. Still.

The best horse, of four years old, belonged to Roger Phelps; the best of three years old, owned by Ralph Watson; best two years old colt, was owned by Martin Palmer.

Specimens of domestic goods were more numerous than at any former exhibition. Among those meriting particular attention, were some beautiful pieces of table linen, offered for inspection by Mrs. Sheldon. Carpets, flannels, &c. were presented by different individuals.

An address was delivered before the Society by Major Ellsworth.

JAMES GOODWIN, Clerk.

Simsbury, Nov. 26, 1837.

SILK WORM EGGS.

Mr Gideon E. Smith of Baltimore informs the Editor of the American Farmer that he has a quantity of silk worm eggs of the best Italian stock for sale, which, during the cold weather, can be sent by mail to any part of the Union, the postage of which will not exceed the treble postage on a common letter. Those who may wish for eggs, can address him at Baltimore, by letter enclosing five dollars, for which a sufficient number of eggs will be sent them, with proper directions for them to obtain a practical knowledge of the cultivation of silk, and an abundant supply of eggs for commencing the business on an extensive scale another year. From the eggs sent them for five dollars, they may obtain from 150,000 to 500,000 eggs for the next year—which will of course produce them as many worms.

WORCESTER COAL.

The proprietors of the Worcester Brewery have for some time past been burning coal obtained from the land of William E. Green, Esq. a little distance from the mine which has been heretofore worked. We understand from them, that it is of a better quality, on an average, than any they have used before. It has been taken entirely from the surface, and is what the colliers call *screenings* or refuse. It may, therefore, be reasonably expected, that a further excavation will produce coal of an excellent quality.—*Spy.*

INSTINCTIVE SAGACITY OF THE BEE.

This hardly needs now an illustration; but, the following, which we copy from a recent work on the natural history of this industrious insect, may interest some of our readers:—

"A snail having crept into one of Mr Reaumer's hives early in the morning, after crawling about for some time, adhered, by means of his own slime, to one of the glass panes, where, but for the bees, it would probably have remained till either a moist air or its own spume had loosened the adhesion. The bees having discovered the snail, immediately surrounded it, and formed a border of propolis round the verge of its shell, which was at last so securely fixed to the glass as to become unmovable, either from the moisture of the air from without, or by the snail's secretion from within.—*Moraldi* has related a somewhat similar instance. A houseless snail or slug had entered one of his hives. The bees, as soon as they discovered it, pursued it with their stings till it expired beneath their repeated strokes; after which, being unable to dislodge it, they covered it all over with propolis.

In these two cases, who can withhold his admiration of the ingenuity and judgement of the bees?

In the first case, a troublesome creature gained admission into the hive, which, from the impenetrability of its shell, they could not destroy. Here, then, their only resource was to deprive it of locomotion, and to obviate putrefaction, both which objects they accomplished most skillfully and securely, and, as is usual with these sagacious creatures, at the least possible expense of labor and materials. In the latter case, to obviate the evil of putrescence by the total exclusion of the air, they were obliged to be more lavish in the use of their embalming material, and to form with it so complete an incrustation or case over "the slime-gut giant," as to guard them from the consequences which the atmosphere invariably produces upon all animal substances that are exposed to its action after life has become extinct. May it not be asked, what means more effectual could human wisdom have devised, under similar circumstances.

THE DRUNKARD'S MIRROR.

A short time since, the papers of a deceased grocer, formerly residing in a neighbouring town, accidentally fell into our hands. Among them were a multitude of orders drawn by a mechanic in his neighbourhood, which have been accepted and paid. The following, copied verbatim, except the names, are a fair specimen of the whole:—

Mr. — Please to send one qt. of N. E. Rum one hand of Tobacco 2 Trout Hooks and three Bisquit. Your Friend

May 28, 1833

Mr. — Please to send me my qt. N. E. Rum by the bearer, Your Friend.

May 29, 1833

Mr. — The *morrow* being the *Sabbath* you will please to send me one quart W. I. Spirits and six bisquit. Your Friend.

May 29, 1833

For months together, such orders were received and answered, one, two, and three, a day;—sometimes for a pint, sometimes for a quart, and sometimes for *two quarts* at a time. When two quarts were ordered, it was in consequence of "the *morrow* being the *Sabbath*." Orders written in the morning were very fair and legible, but when more than one a day were sent, those written after the liquor had operated, were done with a trembling hand, and were difficult to read.

What a subject this for reflection! Rum drinkers of every grade, remember that the papers and books of the traders will remain, standing mementos of your weakness, long after you shall have ceased to afford ocular demonstration of it to your acquaintance. Are you willing to subject your families to such a reproach? If so, go on, your purpose will be accomplished.—*Wor. Spy.*

Fadible Writing.—As the art of man can unmake whatever the art of man can make, we have no right to expect an indelible ink; however, a sort of approximation to it, may be made as follows:—Let a saturated solution of indigo and madder in boiling water be made, in such proportions as give a purple tint; add to it from one sixth to one eighth of its weight of sulphuric acid, according to the thickness and strength of paper to be used; this makes an ink which flows pretty freely from the pen—and when writing, which has been executed with it, is exposed to a considerable but gradual heat from the fire, it becomes completely black, the letters being burnt in and charred by the action of the sulphuric acid

If the acid has not been used in sufficient quantity to destroy the texture of the paper, and reduce it to the state of tæcher—the color may be discharged by the oximuriatic and oxalic acids and their compounds, though not without great difficulty. When the full proportion of acid has been employed, a little crumpling and rubbing of the paper, reduces the carbonaceous matter of the letters to powder; but by putting a black ground behind them, they may be preserved, and thus a species of indelible writing is procured, (for the letters are, in a manner, stamped out of the paper) which might be useful for some purposes, perhaps for the signature of bank notes.—*Quar. Journ. of Science, &c.*

As gardening has been the inclination of kings, and the choice of philosophers, so it has been the common favorite of public and private men;—a pleasure of the greatest, and the care of the nearest—and indeed, an employment, and possession, for which no man is too high nor too low.—*St. W. Temple.*

To make teeth white.—A mixture of honey with the purest charcoal will prove an admirable cleanser.

Prodigious! F. Kalmback, butcher, displayed in the market house, yesterday, a heifer calf, which weighed when killed and dressed two hundred and ninety pounds. The calf was not quite five months old.—*Belvidere, N. Y. Paper.*

The National Intelligencer states, that Colonel M. Kenney, has arrived at Washington from a tour of about 7600 miles among the Indians, and been successful in all the trusts reposed in him by the government; and among these, the important one of settling the Creek controversy, with which duty he was specially charged, by obtaining a cession of all the lands owned, or claimed by the Creeks, within the chartered limits of Georgia.

To cleanse the teeth and improve the breath.—To four ounces of fresh prepared lime water, add a drachm of Peruvian bark, and wash the teeth with this water in the morning, before breakfast, and after supper. It will effectually destroy the tartar, and remove the offensive smell from those which have most decayed.

Dionysius' Ear.—A midshipman of the United States navy, in giving an account of what he saw at Syracuse, says under date of July 1st. 1827—"The cave, or Dionysius ear, is a great work of art, hewn out of the solid rock, to the extent of two or three hundred feet, and about ninety feet in height; resembling in its construction, the organs of hearing in the human head. Here were confined the prisoners of that tyrant, and this cave the medium, through which he became acquainted with every word they lisped. The noise from the experiment we made with a pocket pistol, was almost deafening; in fact, a leaf plucked from a small branch we took in, was perfectly audible at the mouth or ear of the cave."

Knowledge is Virtue.—The axiom "Knowledge is Power" attributed to Lord Bacon, is often quoted, and generally admired. We may very well add to it Knowledge is virtue. Without knowledge there can be no principle, no discernment of right and wrong; and where a community consists mostly of ignorant individuals, we shall gen-

erally find the great mass composing it are as deficient in good morals as they are in useful information.

Hunting with Tigers.—On the Coast of Coremandel, the natives hunt the antelope with tigers.—These ferocious animals, which are not much inferior in size and strength to the royal tiger, are tamed by hunger and blows until they are quite docile. When a hunt is determined on, the tigers are led out by boys, with caps over their eyes, that they may not break away prematurely. As soon as the hunters consider themselves sufficiently near a herd of antelopes, the sign is given to the boy, who instantly uncovers the tigers' eyes, and slips of his leash; the antelopes, with their leader at their head, go bounding along the plain or valley, and the tiger, crouching among the long grass, approaches their line of motion in an oblique direction. When he thinks himself sure of the leader, he rises to his full height, growls and springs forward with immense force and inconceivable swiftness towards the herd. If he strikes the animal he aims at, it is instantly dead; but when he misses his aim, whether through exhaustion or shame, he slinks away and lies down in the most sulky humor in the first hole or ditch he can meet. When he is successful, the boy cuts off a piece of the antelope's flesh, and gives it to him; and with this he is satisfied, and immediately relinquishes his prey.

Artificial Leeches.—This instrument has been invented by Mr Salandier, and acts as an equivalent to leeches. Its advantages consist in extracting the precise quantity of blood that is wanted to be taken from the patient; in withdrawing the fluid with every desirable despatch and gentleness, in not causing that repugnance which naturally attends the application of disgusting insects or worms; in not causing any injury; and, finally, in being practicable in every station, climate, and situation and country. This instrument is manufactured at Paris, by the engineer Demontiez.

Accident.—On the night of the 24th ult. the stable floor of Asa Batchelder, of Royalston, broke down, in consequence of which, five oxen were hung in the stanchals, and found dead in the morning. The floor was elevated four or five feet from the ground. In the other half of the stable, the floor had given away and cracked considerably, so that the lives of five oxen more were endangered. This should serve as a caution to those whose stables are elevated from the ground, to see that their floors are secure.—*Forrester Spy.*

Gas light for factories.—There is a cotton Factory at Middlebury, Vermont, which has recently been lighted up with gas, the only experiment of the kind ever made in the United States. It is found that the expence of the gas is about the same as that of oil, but the former has great advantages, giving a steady light by which the hands can work as well as in the day; is entirely free from smoke, by which the neatness of the factory is greatly promoted, and moreover occasions but little exposure to fire.

A cure for broken skins.—Make a paste of charcoal and water, and apply it to any sore place caused by the skin being rubbed off. This will immediately allay the smart and remove the inflammation.—*Mechanic's Magazine.*

The Warren Star computes that there have been shipped from Bristol, R. I. 535,994 bunches of onions, raised in that town the present season, and that there are 200,000 bunches remaining on hand.

Method of increasing the odour of Roses.—At this purpose, (according to the author of the method) a large onion is to be planted by the side of the rose-tree, in such a manner that it shall touch the foot of the latter. The rose which will be produced will have an odour much stronger and more agreeable than such as have not been thus treated, and the water distilled from these roses is equally superior to that prepared by means of ordinary rose leaves.

Ninety potatoes were taken from the garden of Mr. John Osgood of Haverhill, which were the product of one small potato, placed in the ground for the purpose of giving nutriment to a currant bush, the end of which was inserted in the potato, two of the above number weigh three pounds.—*Haverhill Post.*

Reinforcement for the Colony at Liberia.—We are happy to announce the benevolent act of a gentleman of this city, who has recently liberated twenty three slaves, and sent them to join the American Colony at Liberia, as a reward for their good behaviour.—*Richm. Visitor.*

The Western Herald, printed at Steubenville, Ohio, mentions an ear of corn which was at the office, as being thirteen inches in length and ten inches in circumference. It has 40 rows of corn on it, each row having 60 grains, total 1200 grains.

The best astronomers are agreed that the distance of many of the fixed stars may be such, that since they were first created, the first beam of light which they emitted has not yet arrived within the limits of our system.

Newspapers.—In the year 1775, there were 37 half starved newspapers published in the territory of the Union; in 1810 there were 359 in the United States; since that period the increase has far exceeded the proportion of the swelling tide of population.

Grain.—It has been estimated that upwards of 50 millions of bushels of grain were raised in Ohio last season, or more than 50 bushels for each inhabitant!

Preservation of Green House Plants.—It has been ascertained by Mrs Tregold, that plants may be completely protected from the depredations of insects, by washing them with a solution of bitter aloes, and the use of this wash does not appear to effect the health of the plants in the slightest degree; wherever the solution has been used, insects have not been observed to attack the plants.—*Am. Farmer.*

Mr A. Willard, Jr. of Boston, has made a clock for a large church in Mexico, and it is the first one ever made in this country which strikes the hours and quarters.

To check the increase of worms which destroy fruit.—Gather all punctured or decaying fruit, and give it to your hogs;—otherwise the worms which destroy it, will escape into the ground, to re-appear the next year.

CATTLE SHOW AND FAIR.

The Jefferson county annual Cattle Show and Fair was held in Watertown, N. Y. on Friday the 5th ult. The numerous concourse of people that assembled on this occasion, the quantity and quality of articles exhibited, and the number of competitors for premiums, evinced that the spirit of enterprise which has heretofore characterised our farmers, so far from having declined, continues to excite them to a laudable competition in the different branches of domestic industry. On no occasion since the institution of the Society, have the articles exhibited been more numerous, and of better quality, or the beneficial effects of the Society more apparent, than on this. The stock exhibited, was uncommonly fine,—particularly horses. The improvement in the breed of this noble and useful animal, within a few years, has been great, and we do not hesitate to say that this county now produces as fine horses as any in the state. In the other animals exhibited, much improvement was also apparent. In short, the exhibition of stock of all kinds was much superior to that of any former year, since the organization of the society.

The articles of domestic manufacture were also of a superior quality, and do much credit to the skill and industry of the manufacturers.

It affords us much pleasure to be enabled to state, that the necessary funds were immediately raised to enable the Society to continue its operations another year. Much credit is due to the individuals by whose exertions the Society has thus far been kept up, and the facility with which funds were procured for continuing it, is very creditable to the liberality and public spirit of its members.

REMARKS

By Mr. M. L. RAYNE CHAMMONT, before the Jefferson County Agricultural Society, at its late annual Cattle Show and Fair.

I am desired to avail myself of this day of our public meeting, to make a communication on the vine. Different experiments which have been made, not only by me, but by some other persons in different parts of the country, have convinced us sufficiently, that we were not mistaken, when in observing almost every where about us the luxuriant growth of the wild vine and the maturity of its fruit; we concluded that the vines of Europe might be cultivated here with success. I am convinced that the greater part of our soil would be suitable, and produce good fruit if properly attended. Low wet ground and the immediate vicinity of swamps and marshes, and such of the clay lands where the waters are apt to dwell too long and cannot be drained, are not favorable. A light and somewhat stoney or gravelly soil, as well as a ground having a gradual declivity are generally preferable. A southern exposition is to be chosen, but a northern one may be tried with success chiefly in a dry warm soil.

I had in France a vineyard of which the fruit never was destroyed by the frost; that one was in a northern exposition. Some of the best vineyards in Champagne are in a similar exposition, and I have seen many other examples in favor of this opinion.

It may be interesting to give a short notice upon the different kinds of European grape vines introduced into this country last spring, and which

I think will be most likely to succeed in this country. They are divided into two classes, the table grape, and the grape the most suitable to make wine. The table grape, or first class, consist of
The early black July grape, or early *Morillon*.—This is a small round berry, replete with a sugary juice; it is an early prolific bearer.

White Muscadine.—Berry moderately large, thin skin, and delicate juicy flesh; early grape and great bearer.

Red Chasselas.—Is very like the white muscadine in size and shape, but of a dark red colour.—Is a very good grape, but ripens later than the white muscadine.

White Frontinac.—A large, high flavored grape. The berries are very closely joined, whereby some of them are apt to rot before they are ripe; to prevent which, it would be advisable to thin them out when about the size of a pea.

Red Frontinac.—A very esteemed grape; berries of a brick colour, thin skin, moderate size, and juicy delicate flesh.

The second class consists of the
Mewier or Miller's Burgundy grape.—Berries black, and small; an excellent bearer, and a principal grape to be cultivated for wine.

Pineau of Burgundy.—Esteemed one of the best fruit for making wine. The berries are of a fine black colour.

The Avernat blanc, avernat mewier, gros noir, herbois blanc, petit blanc, gouvais blanc, pinet rouge, pinet blanc, melier blanc, somerita rouge, are too, the different kinds which are preferred in the northern vineyards of France to make wine.

The soil and the situations being chosen you must prepare the ground very early in the spring, if it is not sufficiently rich, you must give it a good coat of compost or of some rich manure, but if possible you must avoid to have recourse to stable manure. In fact, there is very little soil in our country, which will require now much addition of any thing to improve it for the vine; but whatever you add to it, plough in as deep as can be done with four horses or oxen, and a plough sufficiently strong. A month after, cross harrow it and clean it from roots of bad weeds. Stones will do no hurt, and will be rather beneficial unless too big. You must do the same work in June, August and November, omitting only the harrowing for the last. Next spring as soon as the ground is sufficiently dry, you must plough again as deep as possible, in employing for that purpose two ploughs, following one another. Another harrowing will leave you the soil in the desired state for planting; you may either plant in the fall or in the spring. This last season is preferable for us.—We must wait till the cold and the great humidity is gone out of the ground. You must not wait till it is too dry, or else you will run the risk to lose your plants if you have not sufficient recourse to watering them frequently. Those who will be more in a hurry and would not delay one year for planting, must take from the foregoing instructions whatever can in a shorter time tend to the effect of cleansing the ground as much as possible, and of ploughing deep. They must therefore not omit employing two ploughs in the last operation.

When your ground is fit for planting, you must mark it into rows, going north and south, east and west, and put stakes eight or ten feet apart every way, so as to admit the ploughing between, and have room for the sun and air to pass freely. I

would rather the distance be ten than six feet.—The holes must be from eighteen inches to two feet deep, and from twelve to eighteen inches square. The drier the soil, the deeper must be the hole. It would be better to dig it long before hand where there is no danger of stagnant waters.

When you plant the grape vine, you lay down six or eight inches of the plant at the bottom of the hole or trench, and lean the upper part of it on the side of the trench, so as to form an angle, observing to cover the plant gradually with pulverized earth or some ashes mixed with it, and proceed so till you fill up the trench, leaving only two eyes uncovered.

It is very desirable that you plant several species of the vines, whether you wish to raise only better grapes, or have in view at some distant favorable time to make wine. In that way you give your chances, and have more right to expect a regular supply. You must separate as much as possible the different kinds.

You must plough frequently your vineyard, so as to keep it free from grass and weeds, not less than four times is required the first year. The second year as many ploughings are desirable, and you must be very careful not to hurt the roots. In the beginning of April you must strip the stalk bare of earth to the depth of five or six inches, and destroy all the shoots or sprigs and superfluous roots. The stalk is left in that way exposed to the air, for one week or two in proportion to the heat of the sun. A similar operation must take place every year afterwards, observing only to have three inches deeper than the second year. Three ploughings after the second year will be sufficient, observing to make them less deep in heavy soil than in a light one.

I deem that the best time for pruning the vine in this country, is when the hardest frosts are over, some time towards the end of March. The fall of the year is also considered as being a favorable season for pruning the vine, and offering great advantages, and it would be well to make the trial upon some plants. Then one must choose the moment after the leaves of the vine have fallen, and in both cases you must avail yourself of a fine dry day. You must begin pruning your vines the second year, and even the first if the shoots are uncommonly long and vigorous.—In both instances you leave but one shoot with two eyes, taking care to cut the shoots three inches above the second eye or immediately below the third eye, if the distance between the eyes does not exceed three inches. The cut should be made with the sharpest instrument, that it may be very smooth. The following year you may leave two shoots, but no more than two eyes on each shoot. At the fourth pruning you can leave three shoots, and as many at the fifth pruning, if the plant is vigorous, for if it was weak you ought to stop at the fourth pruning to leave more shoots. Your pruning must always be on sprigs of the preceding year. You must rub off all other shoots, but those mentioned above, and for that purpose look over your vines at least once a month during the summer.

The foregoing instructions are generally given for the culture of the vine the most in use, but if you should prefer to keep their vines high, or in arbours you must in that case choose shoots or plants of greater length, and employ longer stakes, to which you tie the vine, and follow the same method of culture and pruning as before, except

that you leave your first shoot from 12 to 14 inches long, observing to cut this shoot close beneath an eye, destroying all the other eyes except the two foremost ones, and so on to all the subsequent pruning. Those who want to make vine arbors will follow this last method.

I would recommend for more security against frosts, to have your young vines bent the first year to the ground and covered with about four inches of earth all the winter. They must only be uncovered when the late frosts are over. We need not fear not to have enough warm weather the ensuing season to give sufficient maturity to our cultivated grapes. Those which you have now before your eyes were perfectly ripe three weeks ago, and you well know that our last season was not the most favorable to accelerate the ripening of fruit. But the kinds of grape I offer at this moment to your examination being of the early species, I must refer you to a much more convincing proof of the complete aptitude of our climate, for the perfect ripening of the European grapes in general. There are in this village, young vines grown in open ground in Mr Stone's garden, which were covered with beautiful white grapes, of excellent taste, and perfectly ripe several days ago. It is that same kind of *Chasselas*, much cultivated in Paris, in France, but which requires there in order to arrive to such a maturity, to be trained in *Espaliers*.

When I recommend to you the cultivation of the vine, I would be very sorry if any one would conclude from it, that I am of opinion that wine could be made now with advantage in the United States. We have some good reasons at present to consider ourselves as not *discouragingly* far from that desired epoch, but while labor will not have fallen much lower than it is, the attempt may be made upon a certain scale, by those who wish to make their own wine, or can afford to sacrifice a part of their time or money to make experiments, but it cannot be made for profit for sale. It may be the only instance where mechanical genius, power of water, machinery or the dexterity of the Americans cannot be employed here so as to overbalance the cheapness of labor in Europe. However I recommend strongly and generally the cultivation of the vine, not only that we may have under our hands the most wholesome of all fruits, and I may say the most agreeable of all tastes, but that we may be prepared for that moment when the price of labor may permit us to cultivate the grape to make wine. We can be made competent to undertake this with success, only by a long series of trials and experiments. The European, the most experienced and the most skillful in this agriculture, could not tell you which definitively will be the best kind of plant for your soil and situation, he cannot tell you near as well as experience will, which will be the situation which will best suit that very plant which is most likely to succeed with you; neither can he say with certainty which is the best season for pruning, &c. &c.; he can only lay down general rules. But in making a variety of experiments you will be initiated into the most valuable secrets of the art; you may find that such a plant in such a situation, with an appropriate culture, will produce grapes which will one day or other repay you richly for your labor; mean while you will not be long before you have a supply for you and your family, of the best fruit, both for taste and health; then when the propitious time comes to make wine with profit,

you will not only have within your power the plants needed to extend your cultivation, but whatever work you are to undertake thus, upon a greater scale, will not be likely to be lost.

As long as we entertain a reasonable expectation to sell the natural produce of our country, as we had done for a long time since the settling of our lands, that is to say, with a handsome remuneration for our labors, we did not feel the need of requiring from our fertile soil other advantages. (By natural produce, I mean wheat, corn and grass, which are our staple articles, and for which our climate and soil are highly favourable.) But when we have waited patiently for several years for an increase of price, in what we continued to raise with an increased success as to quality and quantity, I think it advisable to adopt an additional chance to our industry; chiefly when during that time we have been able to ascertain that the grape vine from Europe will not only grow well in this country, but give good fruit and bear cold winters without the plants being materially damaged.

At the same time we are to consider that for such an article as wine, easy and cheap transportation is one of the most important things, and at least as desirable for it, as for other produce, either agricultural or manufactured, for which we daily feel how much we want our water communications improved.

At last we see efficacious measures and extensive works ensure to a pretty considerable part of our county, the well grounded expectations, to be able in a few months, to export our produce by water, in different directions, to the great markets of the new world. But another part of our county, and a very considerable one too, which cannot take an equal advantage of that most valuable privilege, cannot be far from the moment when something will be done to improve their situation in that respect. Then let us all display our exertions in every way, to make the best use of the goodness of our situation and soil, and be ready to avail ourselves in due time, of the new channels, which, by the cheapness and facility of conveyance to market, will enhance the value of our agricultural produce, as well as that of our increasing manufacturers.

A correspondent in the Farmer's Journal strongly recommends the keeping of Blood Hounds, to facilitate the detection of sheep stealers, murderers, and others. As a proof of the sagacity of these animals, he relates the following instance: About eighteen years ago, a Mrs. Peaton, near Lynton, (Hants,) had a sheep shot about one o'clock in the morning, as the report of a gun was heard about that time; and in the morning the sheep's paunch was found. A person was sent for the hound, to Mr. Edward Toomer, keeper in the New Forest, and before the hound could be brought to the spot it was about two o'clock in the afternoon, a space of time of thirteen hours. He was laid on, and he followed the scent, a very crooked road, to the door of the culprit; the premises were searched in vain for some time, but the hound could not be prevailed on to quit. He at last went into the fuel house, and then began scratching. On removing the fuel, a large stone was found, which the hound scratched, on removing which, the muton was discovered. A search warrant was obtained, the man taken before a magistrate, and sent to Winchester—had his trial—and was transported.

A common silk-worker of Lyons, named Lantures, has invented a new mode for making the twist of the warp of silk. The Chamber of Commerce having caused it to be examined, and admitted the utility of the invention, gave the author a premium of 1,200 francs, and solicited a patent gratis for him; and the certificate for which he obtained from the Minister of the Interior, on the 8th of Sept. last.—*Constitutionnel*.

A fine bloom is given by fruit dealers to cucumbers, grapes, peaches, plums, &c. by powdering them with finely pounded magnesia, which has the effect of bringing the color out. The colors of a carpet, too, on which some calcined magnesia had been scattered, have been observed to be completely revived.

Method of rendering Glass less brittle.—Let the glass vessel be put into a vessel of cold water, and let the water be heated boiling hot, and then allowed to cool slowly of itself, without taking out the glass. Glasses treated in this way, may, while cold, be suddenly filled with boiling hot water without any risk of their cracking. The gentleman, who communicates the method, says that he has often cooled such glasses to the temperature of 10°, and poured boiling water into them without experiencing any inconvenience from the suddenness of the change. If the glasses are to be exposed to a higher temperature than that of boiling water, boil them in oil.—*Annales de Chimie et de Phys.* &c.

Dry Rot.—This destructive enemy of buildings, which generally commences its ravages in the cellars, may be prevented, or its progress checked by white-washing them yearly, mixing with the wash as much copperas as will give it a clear yellow lute.—*Blackwood's Magazine*.

How to preserve Meat in.—Meat which is killed in December, may be kept in perfection if buried in snow till spring. This is an excellent method of preserving fresh the carcasses of turkeys and other fowls.

Set any open cask in a cold place, and put therein snow and pieces of meat alternately. Lay not the pieces of meat touch each other, nor the sides of the cask. The meat will neither freeze, grow dry, nor become discoloured; but be as good in all respects the first of March as when it was first put in. The surfaces of the pieces should be a little frozen, before they are put into the snow, that the juice of the meat may not dissolve the snow. The cask should be placed in the coldest part of the house, or in an out-house.

Burns and Scalds.—Anoint with a mixture of equal parts of linseed oil and lime water, and then apply cotton.

An engineer of the name of Wright has constructed at the West India docks, a crane for raising heavy weights, on an entirely new principle. That of the application of the lever, assisted by wedges, instead of the usual plan of wheel and pinion for multiplying power. We understand the power of two men with the patent crane is capable of lifting from two and a half to three times the weight lifted through the same space in a given time by the best constructed cranes on the old principle of wheel machinery. This economy of power must prove highly valuable on board ship when there is a scarcity of hands.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, DEC. 14, 1837.

FEEDING CATTLE, MANAGING MILCH COWS, &c.

Regularity of feeding cattle is of prime importance. Three times a day precisely at a certain hour, cattle, according to Mr Lawrence, should be furnished with their food. Dr Deane observed that neat cattle and horses should not have so much laid before them at once as will quite serve to fill them. The hay they have breathed on much they will not eat up clean, unless when they are very hungry. It is best, therefore, to fodder them twice at night, and twice in the morning. Let neat cattle as well as horses have both light and fresh air let in upon their fodder when the weather is not too cold and stormy to allow the windows to be open. What one sort of cattle leave should be thrown to another sort. Those that chew the cud will eat the leavings of those that do not, and vice versa.

"It is also well known to farmers, that what cattle leave in the barn, they will eat abroad in the open air; and most freely when it is laid upon clean snow. Not only this, but the meanness of straw should be given them in this way. What is left will help to increase the manure in the yard."

"Every farm yard, where any considerable stock is kept should be furnished with a large shed, and a rack under it. For where there is no clean snow to lay the straw and other mean fodder upon, it should be put into the rack. A large proportion of the dung will be dropped under the shed than in any other part of the yard. And this dung will be better than the rest as it will not be washed by rains, nor so much dried in the sun."

Sir John Sinclair says "Straw given to stock, should be constantly made use of as soon as it is threshed as possible; for if exposed to the influence of the atmosphere, it becomes either musty or too dry; and in that state, cattle neither relish nor thrive on it so well. If it must be kept a length of time for fodder, it should be bound in trusses, in which state it is easier moved, lies in less room, and retains its strength and flavor rather longer, than when loose; or it may be secured in a stack properly built, trodden down and covered. Wheat straw, on account of its strength, is frequently cut into chaff, and given to horses with their corn, [grain]. The chaff is likewise mixed with other food, in particular with potatoes, and given to feeding and working cattle."

In a tract entitled "Notices for a Young Farmer," written, we believe, by the Hon. Judge PENN, formerly President of the Penn. Agricultural Society, are the following directions:

"Cut or chaff your hay, straw, corn tops or blades, and even your stalks with a straw cutter, and you will save a great proportion, which is otherwise wasted, or passed through the animal without contributing to its nourishment. One bushel of chaffed hay at a mess given in a trough three times in twenty-four hours, is sufficient for a horse, ox, or cow. A bushel of chaffed hay tightly pressed weighs from 5 to 5½ pounds. A horse or harned beast thrives more on 15 lbs. thus given, than an 24 or 25 lbs. as commonly expended, (including waste) in the usual mode of feeding in racks: to which troughs properly constructed

are far preferable. Salt your clover and other succulent as well as coarse hay. But over salting diminishes the nutriment. More than a peck to a ton is superfluous. Half that quantity is often sufficient. Ten or fifteen pounds is usually an ample allowance. Feeding your stock by weight and measure of food will not only save your provender, by its orderly distribution, but, frequently the lives of animals, too often starved by niggardliness or neglect, or gorged and destroyed by profusion. If it be true, as it is, that "the master's eye makes the horse fat," it is equally so, that the master's eye prevents the horse from being pampered, wanton, pursive, bloated, foundered and finally wind broken and blind."

If hay is salted by using salt in substance it should be done at the time it is deposited in the mow. In some cases it may not be amiss to sprinkle a solution of salt in water over hay or other food for cattle in the winter time, especially if the fodder be of inferior quality. Lord Somerville recommends salt to be mixed with good as well as damaged hay; and Mr Lawrence says "Of the great use of salting damaged hay, I have known various instances. Heated and moulded hay has thus been rendered more agreeable to the palates of cattle than even the finest, and has improved them in an equal degree."

A writer for the "Republican and Yeoman," whose remarks were republished in the American Farmer, vol. iv. No. 21, page 161 says "The practice of salting cattle in the winter is extremely injurious and should be abandoned. To prevent the necessity of this, by far the best method is to put the salt upon the hay when it is put into the mow. If this be done your cattle will require no salt in its crude state during the whole winter, nor will they take it if offered to them. Another inducement to the practice of salting hay in the mow, is the unavoidable waste of salt and labour which accompanies the old method of using it in the winter in its crude state. It also prevents the danger of the hay's suffering injury from heat, and by improving its quality, will occasion much less waste in the expenditure of it during the winter. This practice of seasoning the hay will be found also to conduce much to the health and thrift of the stock. For the use of salt in the winter is accompanied sometimes with costiveness, and at others it produces opposite effects, and invariably renders the cattle more susceptible of the cold. And it not unfrequently results in the loss of flesh and disease. The profuse use of salt on hay would no doubt prove detrimental, — having for a series of years pursued the practice of salting my hay in the mow, I consider it superior to any other method of using salt, by at least two hundred per cent."

Dr T. Cooper, in an article written for the last Philadelphia edition of Willich's Domestic Encyclopedia, states that "a quarter of an ounce of salt per day to sheep; and one ounce per day to cows and oxen, is an allowance ample enough." Much however depends on the kind of food which cattle are fed with. If they are supplied with roots, pumpkins, or any other green and succulent food, they will require more salt than if they were confined to hay or other dry food. Salt in small quantities, is, perhaps, necessary for the health of cattle as well as that of the human species; but animals of either kind may suffer in consequence of using it too freely in substance,

or by being confined too much on salted provisions. It has been recommended to keep lumps of salt in troughs protected against the effects of weather, by some sort of shelter, and at all times accessible to neat cattle and sheep. In that case it is thought that the instincts and appetites of the animals will induce them to consume the quantity which would prove most beneficial to them. Perhaps it might answer a similar and as good a purpose to permit cattle always to have access to cut straw, or other food of inferior quality, moistened with a strong solution of salt in water. A practical and judicious cultivator informed us that, in giving salt to his cattle and sheep he always mixes it with unleached wood ashes. The mixture is composed of one quart of fine salt to one half bushel of ashes. To this composition his cattle and sheep always have access. He believes that this mixture preserves the health, and promotes the thriving of the animals.

Cows should be kept constantly in good condition, as where they are ever suffered to become very lean, and that in the winter season, it is impossible that they can be brought to afford a large quantity of milk by getting them in perfect condition in the summer months. Where cows are lean at the period of calving, no management afterwards is ever capable of bringing them to afford for that season anything near the proportion of milk that they would have done if they had been supported in proper condition through the winter. Food of the most nourishing and succulent kinds should therefore be regularly given in suitable proportions in the cold inclement months, and the animals be kept warm, and well supplied with pure water. Some advise their being cleaved by combing and other means; but this is a practice, which, though useful in making them yield their milk more freely, can, perhaps, seldom be employed on an extensive scale with advantage.

Mr Loudon says "The time cows should become dry before their calving is not agreed on, some contending that they may be milked almost to the time of their dropping their calf without injury; while others maintain that it is absolutely necessary that they should be laid dry from one to two months, both for the advantage of themselves and of their calves. It is probable that much in this business depends on the manner in which they are kept; as where they are well fed they may be continued in milk till within a week or two of calving, without suffering any injury whatever from it; but in the contrary circumstances it may be better to let them run dry for a month, six weeks, or more, according to their condition, in order to their more fully recruiting their strength. It appears not improbable, but that the longer the milking is continued, the more free the cows will be from indurations and other affections of the udder; which is a circumstance deserving of attention. Where only one or two cows are kept for the supply of a family, it is likewise useful to know that by good feeding they may be continued in milk without any bad consequence till nearly the time of calving."

POTATO ONIONS.

A gentleman at the south, who has raised this year two thousand of these onions, has given us the following account of his mode of managing this valuable vegetable:—"Potato Onions are very productive; they should be killed like potatoes;

I have raised this year nearly two thousand on a small patch, where they grew so thick as literally to crowd each other out of the ground. They require a light warm soil, and frequent hoeing."

New England Farmers' and Mechanics' Journal.
 Conducted by E. Holmes, M. D. Professor of Chemistry, Natural History, and Agriculture in Gardiner Lyceum.

A new publication with the above title, published monthly, at Gardiner, Me. has just been commenced, and promises to be a valuable accession to the interests of science. We have seen the first number, and from that specimen are led to believe that the work will be ably and judiciously conducted. The following extract from the introduction develops the plan, and the means which the conductor relies on for its execution.

"Besides the assurance of assistance from several gentlemen, well qualified to furnish valuable information on the various topics which come within our scope, and which will undoubtedly be highly interesting, as well as original,—we have ample means of extracting from the various periodicals of the day, whatever may be considered useful to the Mechanics and the Farmers. Most of the Scientific Journals and Magazines published in France, England, and the United States, are taken at the Lyceum. Such selections from these works will be made, as shall be considered applicable to the design of our publication, and the pursuits of our patrons. The inventive genius of the people of New England, is another rich source from which we expect to derive much that is valuable. Every day produces some new combination of mechanical powers—some new improvements in the arts of life, whereby labor is lessened and its effects increased."

We are happy to unite our efforts with such fellow laborers, and are convinced that the demand for works of useful information, will increase in the same proportion in which the means of supplying such demands are multiplied.

CITY AFFAIRS.

On Monday last, the Hon. Josiah Quincy was chosen Mayor, by a vote of 2189 to 440—and John F. Loring, Robert Fennelly, James Savage, Thomas Kendall, John Pickering, James Hill, Phineas Upham, Samuel T. Armstrong, Aldermen.—Mr. Amos Binney had 349 votes for Mayor, and there were 100 scattering.

TWENTIETH CONGRESS—FIRST SESSION.

In Senate Dec. 3, 1827.—The hour of 12 having arrived, the Vice President took the chair. The roll of Senators having been called over by Mr. Lowrie the Secretary, it appeared that every member was in attendance, except Mr. Webster, of Mass and Mr. Thomas, of Illinois. Col. Johnson, of Kentucky, gave notice that he should introduce a bill to abolish imprisonment for debt.

House.—The House was called to order by M. St. Clair Clarke, Clerk of the House—and the Roll of the House being called over by States, it appeared that two hundred and seven members, out of two hundred and thirteen answered to their names; the House proceeded to ballot for a Speaker. The result was,

For Andrew Stevenson, of Virginia,	104
John W. Taylor, of New York,	94
P. P. Barbour, of Virginia,	4
Scattering votes,	3

Animal Instinct.—A friend in South Boston has given us the following instance of the longevity and instinct of the Hen, which is worthy of notice.—"Early in April 1847 I raised a brood of chickens, one of which survived till yesterday, when she died, lingering under all the infirmities of old age, being 10 years and 8 months old. 'Till the last year she continued to lay eggs, and rear chickens. During the last 8 or 10 months all her powers became sensibly impaired; but her parental instinct continued—as she protected and provided for the broods of other hens committed to her care; and the last service of her useful life, was the charge which she voluntarily assumed of a brood that had lost their parent hen, assisting and protecting them till the severity of the weather prevented."

Dogs used as beasts of burden.—Col. M. Kenney in his tour to the Western Lakes, &c. mentions that in the winter of 1820, two gentlemen came from Lord Selkirk's (British) Establishment on the Red River, to Prairie du Chien, on the Mississippi, a distance of several hundred miles, each drawn on a Train by three or four dogs." We have heard of dogs being used in this manner in Russia, and perhaps in some other eastern countries; but were not apprised of their ever having been subjected to the yoke or collar, on this continent. The "Train" here spoken of, is a species of broad bottomed land-canoe, much used throughout Lower Canada, calculated to be drawn with ease on the snow, where there is no beaten track. Unlike our sleighs, they have no runner, but are drawn on their flat bottoms, and move in an irregular zig-zag manner, having nothing to guide or steady them.

The late Admiral Cosby, of Stradbally Hall had as large and as brown a fist as any Admiral in his Majesty's service. Happening one day, unfortunately, to lay it on the table during dinner, at Colonel Fitzgerald's, Merion-square; a Mr. Jenkins, (a half blind doctor) who chanced to sit next to the Admiral, cast his eye upon the fist—the imperfection of his vision, led him to believe it was a French roll of bread, and without further ceremony, the doctor thrust his fork plump into the Admiral's fist. The confusion which resulted may be easily imagined.

Novel Capture.—On Friday, a wild deer, escaped probably from his fastnesses in New Hampshire, was discovered at sea, about two miles from the shore, and secured by two men who were out in a skiff fishing. The animal was shot at on the other side of the river, and made to sea from the Salisbury point. There is reason to think he had been hard pressed—as, we believe, it is observed by hunters, that it is in extreme trepidation only, that the animal takes to the water. It was a lucky haul for the fishermen, ten dollars being obtained for him.—*Newburyport Herald.*

Among the recent inventions in our city, is one lately imported from France, by Mr. Richard, for smoozing woollen cloth. It strikes the cloth as much as by the usual way, leaving all the original gloss and finish, which cannot be removed by rain or dampness. We understand it has been adopted by several of the craft, and has given entire satisfaction.

The great New York Canal is re-opened as far up as Rochester,—and boats are daily passing down to Albany.

The exclusive privileges of the East India Dock Company expired on the 2d inst.; and as a proof of the advantages of competition, the rates previously charged, amounting to 12s. per ton register, are now charged but 2s. 6d.

A carpet manufactory, in Jersey city, (owned in New York,) has a capital of 400,000 dollars, and employs one hundred hands, making 2,500 yards weekly. The spinning and preparing the yarn employ another hundred persons.

It is said the bad state of Mr. John Randolph's health, will not permit him to remain at Washington but a few days.

An order in Council has been issued, permitting the entry of American vessels at the Bahama Islands, in ballast only, and exporting therefrom, salt and fruit, only, to the United States.

It is stated that the Lord High Admiral of Great Britain, has determined upon fitting out another expedition to the North Pole.

The Hon. Daniel Webster and his lady were both detained by indisposition, at New York, at the last dates.

Superior Tulips.

For sale at the office of the New England Farmer, a further supply of Dutch Tulips, at a moderate price.
 Also, a few POIATY GONIONS—with every variety of Garden Seeds, Flower Seeds, &c.

Bremen Geese.

For sale, 3 pair of this superior breed of Geese; they are decidedly the superior breed in the great state they contain, in the facility with which they may be raised, and in the comparatively small quantity of grain required to fatten them.—Inquire at this office.

Trees, Ornamental Shrubs, &c.
 MR WINSHIP offers for sale at his Nursery, in Brighton, the largest variety of Fruit and Ornamental Trees, Shrubs, &c. His collection of Fruit Trees is large and well selected, and his variety of Ornamental Shrubs is very extensive, comprising the Rose Acacia, Three thousand Acacia, Gum Acacia, double Flowering Almond, red and white, Albrea, Bladder tree, Magnolia Radicans, Burning Bush, dwarf flowering, Pink Chestnut splendid flowering Catalpa, Dullias, Daphne, Pink Mazzone (first flowering shrub) variety of Grapes, variety of Limes, &c. English Ashes, Weeping willows, Quinces, Syringes, Laburnum, Showball, Rhubarb, Raspberries, Plums, Pecan nut trees, Mountain Ash, Lilacs, Larkspur grandiflora, Japan pear, Japonica cherrubus, &c.—Orders for any of these articles, addressed with Mr RUSSELL, at the New England Farmer office, will be executed on the same terms as at the nursery, and delivered in Boston, free of expense.—Catalogues furnished gratis.

Bremen Geese.

FOR SALE, 10 pair superior BREMEN GEESSE. Apply to THOMAS WILLS, North's Island, or to Mr RUSSELL, at the New England Farmer office. Dec 7.

For Sale.

TWO large, well trained and powerful mares, with foal by the celebrated imported horse *W. Blunder*. These animals are perfectly broke to the saddle and all kinds of harness—will work before you, and are perfectly kind and good travellers. To persons wanting more to be introduced into this country, opportunity not often met with—Also 2 pair of WILD GEESSE.

Apply to BERT. AUSTIN, near Mr Greenough's, no enquiring in Newion, or to J. B. RUSSELL, at the New England Farmer office, Boston. Dec 7.

MISCELLANIES.

From the *Philadelpia Magazine*.

THE VOICE OF WINTER.

Come—my breath is on the blast!
A wreath of clouds is o'er me;
And the loveliest flowers of earth as I pass,
Have wither'd and shrunk before me.

I have found the earth in its richest bloom,
I come to gather its pride to the tomb;
I have found it all with joy elate,
I come to make it desolate.

The leaves of the trees are rustling and gay,
The sheen of the river is bright as the spring—
I will blow those rustling leaves away,
I will stop the streamlet's murmuring.

I will strip of its robe the towering cell,
Its roofs shall be torn, and its limbs be broke,
I will howl through the waste, and the wild beasts there
At the sound of my voice shall shrink to their lair.

The eagle shall close her soaring wing,
And seek her nest on the eyrie high;
And every songster cease to sing,
At the sound of my ominous rushing by!

I will bow to the dust the gayest flowers,
And strip of their pride the fairest bowers,
I will clothe the earth in white as I come—
The winding sheet of her wintry tomb!

Soft Lips.—A lady of fashion inscribed on a pane of glass, at an Inn, in Straines, (England.) "Dear Lord Dorrington has the softest lips that ever pressed those of beauty." Foote, coming into the room soon after, wrote underneath—
"Then as like as two chips,
Are his head and his lips?"

The following instances of erroneous estimates by publishers are given in Mr. Goodhugh's popular work, "The English Gentleman's Library Manual." At first *Winter* would not give Thomson a farthing for his *Winter*. He afterwards gave him three guineas for it. Cave offered half the booksellers in London the property of the *Gentleman's Magazine*; and, as they all refused to engage in it, he was obliged to publish it himself.—*Burns's Justice* was offered in vain to every publisher, for 50*l.* Dr. Buchan offered his *Domestic Medicine* to every principal bookseller of Edinburgh and London for 100*l.*, without obtaining a purchaser; and after it had passed through twenty-five editions, it sold in thirty-two shares, at 5*l.* each. Beresford offered the copyright of the *History of Human Life*, for 20*l.*; it afterwards realized 5,000*l.*

A captain of a West Indian man wished to purchase a horse; in consequence, he applied to a well known character, who sold him one. After the purchase had been made, the captain observed, "Well, now the horse is mine, pray tell me candidly, whether he has any faults, and what are they?"—"What do you mean to do with him?" replied the other. "Why, to take him to sea, said the captain, "to the West Indies."—"Then I will be candid," replied the dealer, "he may go very well at sea, but on land he cannot go at all, or I would not have sold him."

It is said the arches of the tunnel under the Thames are built with a new Italian cement, which makes them tight, and preserves them even from dampness.

Advantage of Newspapers.—During the past season, we published an extract from a writer on the subject of raising English turnips, describing the best method of cultivating that vegetable. A highly respected patron, of Essex county, happening in at our office a few days since, stated to us, that in consequence of following the directions contained in that article, he had raised from a little over ten rods of ground seventy bushels of excellent turnips, equal to about one thousand bushels to the acre, some of which weighed from ten to thirteen pounds. He states, that early in the spring he ploughed the lot two or three times,—and fenced it off for a cow-yard, for which purpose it was used until the usual time of sowing, when it was again ploughed, harrowed, and sowed broad cast. The ground had formerly been much infested with weeds and thistles; to remedy which, the turnips were hoed and thinned out several times, commencing soon after they had attained the third leaf. He attributes the success of his crop almost entirely to the hoeing and thinning of the plants—as, by similar treatment in every other respect, he had never before had much success in the cultivation of turnips.—*Vermont Republican*.

The Moon.—Some persons are very particular in sowing their seeds in a particular time of the moon. Let such regard their moonshine—it may make the negligent plant their seeds in season.—But he that has his ground well prepared, and plants good seed, and does it early, will find that moonshine will affect his crop more than moonshine. The hogs, too, must be killed in a particular time of the moon, in order to have the pork savory by boiling! We have only to say to such characters, fatten your hogs upon *We-hell!* instead of corn, and kill them if you please in your particular time of the moon, and neither your pot nor pork barrel will burst by the swelling of your pork.—*Berk. Amer.*

Roses.—Perhaps among the productions of the vegetable kingdom there is none more remarkable than a rose recently introduced into Europe from China, the *Rosa Grevillei*, or *Greville's China Rose*. In one specimen that we have seen, the shoot far exceeds any thing of the kind, having in the space of a few weeks attained the height of eighteen feet, and it now covers an area of about one hundred square feet, with more than a hundred trusses of flowers, some of which have more than fifty buds in a cluster, so that the amount of flower buds may be computed at three thousand; but the greatest curiosity is the amazing diversity of tints in the buds at first opening—white, light bluish, deeper bluish, light red, deeper red, scarlet and purple, all on the same cluster. This rose grows in the manner of the mulkalla, but is easily distinguishable by its leaf, which is much larger and more rugose.—*Enc. pa.*

Destruction of Rats.—A correspondent who had noticed, in a recent number of our Journal a paragraph recommending ground cork, fried in grease, as an efficacious plan for destroying rats, states that he lately put the plan to the test of experience, and completely succeeded. The case was that of two old women in the village of Denny who had lived in two detached garret rooms of the same building. The rats had long been troublesome, but at length became so numerous and daring, that

they fairly threatened to challenge the tenants with longer possession. The fried cork had only been laid for them three nights before the whole disappeared. A fact of this kind cannot be made too public—since it may be the means of preventing many of those serious accidents which so frequently occur from the use of poison.—*Stirling pa.*

No fewer than about 1,648 species of plants, mostly new, have been recently discovered in our new Indian territories. Among these are a chestnut and an oak. No country was ever more gifted with natural capabilities; forests of timber trees: fine and navigable rivers; animals of all sorts.

The efforts made in Flanders for the cultivation of the vine have completely succeeded. The commencement of the vine harvest was at Renaix, the occasion of a fete, in which the authorities took part. Fifty acres of land planted with vines have produced about 30 tierces of wine.

At a dinner recently given by the city of Amiens to the King of France, was placed on the table opposite to his Majesty, an immense column, composed of sugar manufactured from beet-root, at Frauvillers, near Amiens. The column consisted of four different qualities of refined sugar, and crystals of raw sugar formed the pedestal.

Fruit Trees.

WM. PRINCE, the proprietor of the *Linnæan Botanic Garden and Nurseries* at Flushing, L. I. has the pleasure of informing the public, that his nursery now contains 172 varieties of the Apple, 322 of Peaches, 40 of Cherries, 130 of Plums, 250 of Apples, 84 of Peaches, 20 of Nectarines, 100 of Almonds, 14 of Mulberries, 6 of Quinces, 16 of Figs, 16 of Currants, 17 of Raspberries, 47 of Gooseberries, 20 of Strawberries, 257 of Grapes, 600 of Ornamental Trees. Above 300 of the above kinds of Fruits are not to be found in any other collection in America.

The different varieties cannot be otherwise than genuine, as the greatest attention is paid, and nearly all the kinds are inoculated from bearing trees. The Cherry, Peach, and other trees are generally of large size. Catalogues may be obtained at the New England Farmer office, gratis, and orders left there or sent by mail, will meet attention.

JAMES BLOODGOOD & Co's.

Nursery, at Flushing, on Long-Island near New York.

IN behalf of the proprietors of the above nursery, the subscriber solicits the orders of horticulturists who may be desirous of stocking their gardens and fields with fruit trees of the finest sorts and most healthy and vigorous stock at the present season.

Proprietors & Co. attend personally to the inoculating and grafting of all their fruit trees, and purchasers may rely with confidence that the trees they order will prove genuine.

The subscriber, agent of the above nursery, will receive orders for any quantity of

FRUIT AND FOREST TREES,

FLOWERING SHRUBS,

AND

PLANTS.

And the trees will be delivered in this city at the risk and expense of the Purchaser; the bills may be paid to him. The reputation of this nursery is so extensively known and has been so well sustained that it is scarcely necessary to refer those in want of trees to any of the Horticulturists in this city and its vicinity, and in order demonstration to be desired, I invite those who wish to be thus satisfied to examine the trees in my garden at Dorchester, procured from the nursery for three or four years past, some of which are now in bearing, all in a healthy and vigorous state.

Catalogues will be delivered gratis on application to

ZEPH COOK, Jr.

Regent's Building, Congress-Street.

New England Farmer's Almanack, for 1828. Just published at the New England Farmer Office, and for sale by BOWLES & DEXTER, 72 Washington Street, and at the Book-stores generally, the *New England Farmer's Almanack*, for 1828. By Thomas G. Fessenden, Editor of the New England Farmer.

The FARMER is published every Friday, at \$3.00 per annum, or \$2.50 if paid in advance.

Gentlemen who procure *five* respectable subscribers are entitled to a sixth volume gratis.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. PEsSENDEN, Editor.

VOL. VI.

BOSTON, FRIDAY, DECEMBER 21, 1827.

No. 22.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

FALL TARRING.

MR PEsSENDEN—I noticed in your paper of the 23d ult. a few observations on the subject of the Canker Worm, and the application of tar as a remedy. After stating that many persons had tried the experiment of the tar, and failing altogether in the object of its application, have become skeptical as to its efficacy in preserving our orchards from the ravages of that destructive worm, the writer undertakes to point out the causes of this failure, and asserts from the authority of an intelligent cultivator, that the grub when it finds its ascent into the tree intercepted by means of the tar, deposits its eggs below; and by the time these become animated, and possess the power of locomotion, the ordinary season of tarring has long passed by, and they ascend the tree over the dried tar without annoyance. Agreeably to this hypothesis, the writer recommends tarring very late, or at the season proper to meet the necessity of the case. Admitting the spring to be the only season in which they ascend the tree, the opinion of the writer is the only one naturally suggested to the mind, that accords with the fact of their escape—but it is merely hypothetical.

It is a well known fact that the canker worms ascend in the autumn as well as in the spring; and as far as my own experience extends, in much greater multitudes. In the summer of 1826 I had some canker worms in my orchard, but not so many as materially to injure the fruit, and last spring I applied the tar. I commenced as soon as the frost was out of the ground, and continued to apply it every day when the ground was not frozen, until none of them appeared in the tree. I was pleased with the idea that few or none had escaped me. I was much deceived, however, for I had ten times as many worms upon my trees as the year before. There was hardly a leaf in the whole orchard that was not devoured. To me this was inexplicable until a gentleman of my acquaintance of much intelligence, assured me that they ascend in the fall; that he had applied the tar to his own trees at that season, and caught as many as in the spring. Fully relying on the correctness of the account, I applied the tar to my own trees, on the first of last month. For the first two or three applications, I caught but few—but every night from the 4th to the 10th, when the ground was not closed by the frost, the tar was mostly covered with them. There were but few nights, however, from the 1st to the 10th of the month, in which the ground was not frozen too hard for them to escape—and none, I believe from the 10th to the 20th. I tarred my trees, notwithstanding, on the 16th but the following night being colder than I anticipated, none could escape from the ground. But the 20th day of the month was warm, and towards the evening a little rainy, and I observed the tar that I had applied on the 16th was getting quite liquid and running down the bodies of the trees. This condition of the tar seemed to preclude the necessity of applying it

on that day, and I omitted it. The following night it rained and the wind blew heavy from the S. E. and most of the night, the ground must have been open to the escape of the canker worms. The next morning I went into my orchard, and was indeed amazed at the view presented by my trees. Not only every particle of the tar was covered with them, but the trunks and principal branches were nearly as much crowded as the tar. No system of tarring now in use, I am thoroughly convinced, would have saved my trees on a rising so multitudinous as on that night. They had been enclosed in the ground for three weeks, almost the whole time of their ordinary ascent at that season of the year, and when in common years the ground is open almost every night to their escape. I have always, however, caught most in stormy nights when the wind is at the S. E. From all I can learn, I am inclined to believe that they continue under ground, after they enter it in the summer, not more than four months before they commence their return; and if we undertake to preserve our orchards by means of the tar, we must commence as early as the middle of October, and continue to apply it every day when the ground is not frozen, until some time in the following April. But when the canker worms are so numerous as to destroy the whole foliage of an orchard, and the ground closed for ten or twenty days in succession during the season of their ascent, and suddenly opens, as on the 23th of last month, the common mode of tarring will not answer.

T. W.
Bristol, (R. I.) Dec. 18, 1827.

APPLE POMACE.

MR PEsSENDEN,—I am confident my brother farmer's plan, of Norfolk county, is by no means the most economical way of disposing of his apple pomace, though I may not be able to convince him of it. I admire his separate apartments for hogs, and his conductors to convey the water to them from his spacious cider-mill establishment; and, as food for his hogs, if dealt out in such quantities as they will actually consume. I have no objection to giving them their share of the pomace. But as it is evident that six or eight hogs will eat but a small part of the pomace from two or three hundred barrels of cider, I think there is great waste in giving them such a quantity. For indeed, what is not consumed by the hogs is almost wasted outright; because it contributes but very little to the value of manure, until it has passed through the hogs, or other stock, and because I am perfectly satisfied, from the observation of thirty years or more, that it is a valuable food for all kinds of farm stock. There is nothing that domestic animals more greedily devour; and in a scarce season for hay or grain, such a quantity of pomace might be turned to much better account than to throw it all to the hogs.

My farming establishment, I presume, is small, very small—compared with that of the Norfolk farmer; but I make, annually, a much larger proportion of manure, (I think) with a less number of hogs, without pomace; chiefly from weeds, and such kind of rubbish. I will, therefore, venture to recommend an experiment to my brother farmer,

which, on trial, I believe they will prefer. As the pomace is pressed out, let it be thrown into a heap, under cover, if possible. Perhaps a corner of a eighty foot by twenty three est. bishment might be spared, and let this luxury to farm stock be dealt out in due proportion to them all: in such quantity, and at such intervals as not to cloy, and cause them to loathe it. Especially let poultry of all kinds be well supplied with it. I prefer them fatted on apple seeds to any thing else. And they fat very quick on them. Thus the grain may be all saved, that they would otherwise consume. For if it can be secured from waste, it will serve for their winter's food. And it will be at all times grateful to cattle, sheep and hogs, and save a proportion of their food, of much more value, I doubt not, than the raw pomace in a mass to be worked into manure by the hogs alone. Respectfully,

A BROTHER FARMER.

December 19th, 1827.

From the *Newburyport Herald*.

Take a fresh Musk-rat's skin, cut a strip one and a half inches wide, put it round the child's neck flesh side to the neck, on going to bed at night,—and four or five nights will effect a cure in the most obstinate case.

Having heard of the same remedy for the Asthma or difficulty of breathing, and at times suffering greatly myself in that way, I was induced to try the musk-rat's skin in the same manner. I found it would apply nearly as well to my case, as the child's on which I have tried, and know it has nearly cured the cough on applying the skin five nights which raged to an alarming degree.

Yours respectfully,

CHARLES B. PATTEN.

Newbury, Dec. 7, 1827.

To kill Ear-wigs, or other Insects, which may have accidentally crept into the ear.—Let the person under this distressing circumstance, lay his head upon a table, the side upwards that is affected; at the same time let some friend, carefully drop into the ear a little sweet oil, or oil of almonds. A drop or two will be sufficient, which will instantly destroy the insect and remove the pain, however violent.

Grass Banks.—When the Belgians, who have little access to turf, wish steep banks to be covered with grass, they first form them of earth, made up to a sort of stiff mortar, and cut to the requisite slope, and then cover the surface with rich soil mixed up into a plaster with water and grass seeds, which soon spring up and cover the whole with verdure.

Lord Kingston is said to have upwards of *thirty thousand* liberty trees growing upon one estate in Ireland, and has already sent a quantity of raw silk into the market.

Domestic Broadcloths, for gentlemen's surtouts, are now selling in Boston for *two dollars seventy five cents* per yard. Nothing is more absurd than the Southern fears, of paying dear for American cloth.

From London's Gardener's Magazine.

On the Culture of the Potato, in respect to Earliness, the Curl, the Worm, and other Circumstances.

It has been a very old custom to obtain potatoes for sets from cold situations and poor soils, it being conceived that a change from such a soil and climate would make them grow better and more luxuriant in rich soils and warm situations, like removing an animal from a cold country and short pasture to the rich pastures in the warm valleys.

I have endeavoured to trace the effects, long and well known, to their true causes, and to combine the whole in one connected system, which, if correctly attended to, will produce every variety of the potato six weeks earlier than they are at present obtained, without any additional trouble or expense whatever.

Obtaining a crop six weeks earlier than usual is an object deserving the highest consideration; its coming into use at the season of the year when the poor man's garden affords him no new vegetables, when the stock of the old potatoes is become short and dear, and, withal, so bitter, unpalatable, and unwholesome; to have then a crop of new potatoes is a delicacy indeed, especially to the poor, depending so much for their support upon the potato; still more so to the Irish poor, to whom the potato may be said to be the staff of life.

I have planted several rows of early pink-eyes from ripe tubers, which are now coming up, almost all curled. Not a curl appears upon any of the same variety from unripe tubers, although planted within a few yards of each other. The last autumn being warm and long, enabled the worm to grow stronger and more vigorous to attack the potato, in which it made holes, and therein, perhaps, deposited its eggs, which, nourished by the heat, acquired life and strength; and, after the potato was planted and began to grow soft, it grew vigorous, and preyed upon its sap, rendering the plant weak and curled. I am inclined to think that the worm is the cause of the curl; and that, if potatoes intended for sets were taken up before being ripe (before they are full grown), the worm will not have attacked them; and that, if it has, exposing the potatoes to the sun, as I have described (vol. ii. page 171.), will kill the worm before it has deposited any of its eggs. This hint I submit to your intelligent readers. I must own, however, that it requires more experiments than I have yet made, to come to a final conclusion on the subject.

The worms prevailed last autumn in the potato, to that destructive degree, that they consumed much of the wheat sown upon the potato ground, before they were destroyed by the frost. In this and the adjoining counties, in almost all the ground where potatoes were grown, large patches appear naked, without a plant of wheat, although the plants now remaining are strong and healthy.

Allow me to impress on the minds of your readers the facts, that taking up the potatoes intended for seed next year before they are ripe (before they are full grown), and exposing them to the sun for a month or six weeks, and, at planting time, observing the eye cut and placing it upward, will secure, without any other trouble or expense, a crop of every variety of the potato, six weeks earlier than the same variety of the potato, allowed to grow ripe, will produce.

I am, Sir, &c.

A Denbighshire Gardener.

Restoring Vegetable Life.—This object may in many cases be effected by a powerful stimulant, and, for all practical purposes, nothing is better than hot water, as any person may prove to himself with a withered rosegay. Camphor, however, is a still more powerful stimulant; and, by combining this substance with water by the medium of alcohol, as much can be effected in the way of restoration to life, as is practicable in the vegetable kingdom. In the *Transactions of the Prussian Gardening Society* directions are given for dissolving the camphor in alcohol to saturation, by adding it till it remains solid at the bottom of the vessel. The alcohol so prepared is to be added to water in the proportion of four drops to an ounce, and the two fluids beat together, till the flocculi of camphor disappear. Plants or parts of plants are then to be immersed in this liquid, but not longer than four hours; for, if the vital principle cannot be restored in that time, they may be considered irrecoverable.

Watching the bees.—The hive is placed upon a weighing beam, about three feet eight inches long, with a board on the other end, on which stones of the weight of the hive are put. When the bees began to east, (an ordinary top swarm is between 4lb. and 5lb. wet ht.) and when the first pound's weight of bees had left the hive, the beam will turn back a little, the same way as a merchant's scale does on the counter; but before the scale rests, it forces out a trigger, like the pin of a mole trap, which lets off a small iron wire to a bell in the house, that gives sufficient warning to the bee-mother to go and take care of the swarm. The above method has been practised for several years by Mr. Duncan, gardener, near Ayr.—(*Glasgow Chronicle.*)

SHEEP.

Numerous droves of sheep, containing (altogether) as many as five or six thousand head, have been driven through this town, westwardly, this fall. The whole number sold in this State may be computed at 20,500. The prices which they have brought have been only from thirty-seven and a half to seventy-five cents, average about fifty cents a head!—though a considerable portion were much improved by the Merino cross. What would these animals have been worth, if the farmer's Bill had passed the last Congress? Not less, we would judge, than two dollars a head. *Frankfort, (Ken.) Reporter.*

New South Wales.—The cultivation of sugar appears to make rapid progress in this colony.—Two vessels laden with sugars of the new crop sailed for England in June last. Mr John Macarthur has been indefatigable in bringing forward improvements in agriculture, and particularly the wools of the colony. 175,000 acres of land on this side of the mountains are to be measured forthwith, and appropriated as a glebe to the Australian Church. This quantity is independent of the grant for the like use, over the mountains. 200,000 acres also, at Van Dieman's Land, are destined to become the property of the Church. An order was made by Sir Thomas Brisbane, previous to his departure, for the appropriation of 20,000 acres of land to the Wesleyan Missionaries, who are employed in the conversion of the aboriginal natives of this country. In mentioning the improvement of these distant colonies, we should undoubtedly notice the advance in politeness. The Van Die-

man's Land paper states, that the female convicts lately landed "are quite of a superior class of society," and many compliments on their personal appearance and accomplishments.—(*British Farm. Chronicle.*)

Porter plaster for bruises.—This simple, singular, and safe remedy for bruises, is nothing more than a gallon of porter simmered in an earthen vessel, till, when cool, it will be of the consistency of a plaster. This preparation was spread on an old glove, and applied round the ankle of a coachman, who was thrown off his box, and miserably bruised. In three days it so effectually performed a cure, that *Concise* was enabled to re-mount his box, perfectly relieved from all swelling and pain.—(*Eng. Receipt Book.*)

Mechanical or Artificial Leeches.—This instrument has been invented by Mr. Slander, and acts as an equivalent to leeches. Its advantages consist in extracting the precise quantity of blood that is wanted to be taken from the patient;—in withdrawing the fluid with every desirable despatch and gentleness;—in not causing that repugnance, which naturally attends the application of disgusting insects or worms;—in not causing any injury—and finally, in being practicable in every station, climate, situation, and country.—This instrument is manufactured at Paris, by the Engineer Dumontier.

CHILDREN.

The following from the *Middlesex Gazette*, upon the management of children is correctly conceived:

Very few boys will be insulting, or mischievous, or backward at school, who a properly managed at home. And a majority of parents, being tired of the noise, roguery and ill behaviour of their children at home, send them to school with no rules or lessons for their conduct, expecting the master in the penitence of his wisdom and *laissez* to make them fine scholars, and fine gentlemen, and amiable men and women all at once, and all this is expected many times without a frown or blow, as though it were perfectly easy for a school teacher to make of forty boys at school, what a parent cannot make of two at home. "The milk of human kindness" in children is often spoiled at home, and parents wonder they do not grow right up at once, just as they ought to in every particular, under the tuition of their teacher.

Remedy for Chibblains.—Soak them in warm bran and water, then rub them well with mustard seed flour; but it will be better if this is done before they break.

MANAGEMENT OF PIGS.

The following experiment was made by a gentleman of Norfolk. Six pigs of the Norfolk breed, and of nearly equal weight, were put to keeping at the same time, and treated the same as to food and litter for about seven weeks. Three of them were left to shift for themselves as to cleanliness; the other three were kept as clean as possible by a man employed for the purpose, with a curry-comb and brush. The last consumed in seven weeks fewer peas by *five bushels*, than the other three; yet they weighed more when killed by two stone and four pounds [thirty-six pounds], upon an average, or six stone twelve pounds [105 pounds] upon the whole.—(*London paper.*)

Observations respecting the Utility of Swallows. by the Rev. David Ure, Minister of Uphall, in Scotland.

One advantage, which this country enjoys with most others, is derived from the Swallow. These migratory birds are of an incalculable advantage to the interests of society at large, but more immediately to the husbandman. Nature has, by instinct, directed them to build their nests, and bring forth their young, at the season of the year when those insects, on which they live, are beginning to injure the rising crops, by depositing their eggs for the production of caterpillars. Were those myriads of insects, with which the air then swarms, allowed to fly about, without an enemy to destroy them, the caterpillars, their offspring, would, in a short time, become so numerous, that every vegetable would be totally destroyed. One of their greatest enemies is the Swallow. The most of common birds also feed their young with caterpillars—which circumstance astonishingly lessens their number. But the Swallow feeds her young with the insect or parent of these caterpillars, and is of superior advantage; for, by destroying a single fly or insect, in the beginning of summer, many thousands of vermin are prevented from coming into existence. Thus applying a remedy to the evil in the most effectual way.—Every encouragement, therefore, should, by the lovers of Agriculture, be given to those friendly visitants. Some thoughtless people discourage them from frequenting the neighbourhood of bee hives, from a suspicion that in their flight they pick up the bees. This perhaps is no more than a suspicion: for it is perfect that Swallows will not injure bees or any other insects that are armed with stings. But although a few bees should be destroyed by them, their loss is of very little consequence, compared with the advantages arising from the destruction of the caterpillars and other devouring vermin. It is believed, by accurate observers that one nest of Swallows will devour in a season, about 100,000 insects, which, with their caterpillars, would destroy an immense quantity of growing vegetables. Another advantage arising from the Swallow is, that it never lives on grain, which is not the case with most other birds.

Patent Water-wheel.—The Dover (New Hampshire) Republican, states, that "Mr. Elijah Skinner, of Sandwich, has patented an improvement in the open screw or spiral water-wheel, called the 'open screw water-wheel,' which promises to be of great utility. This wheel is used by placing it horizontally in a river parallel with the current; and, where the depth of water will admit, wholly immersed, giving the water free passage into the screw or horizontal bar. In small streams, where there is but little head and fall of water, this wheel may be used in a similar manner to the tub wheel by means of the water passing through a long hollow cylinder in a perpendicular or oblique direction. The advantages claimed for this improvement are, that these wheels may be used to advantage in slow and deep currents where dams cannot be conveniently built, without obstructing navigation, and may also be used in tide waters with the ebb and flow of the tides, or in floating mills, or at the bow or stern of vessels for working the pumps, &c.; and lastly, its cheapness of construction."

Cultivation of silk.—Considerable attention is now paid to the cultivation of this article. A number, within our knowledge, have engaged successfully in the business. Their success will be productive of much benefit. It will excite the attention of others to this employment. The following facts are worthy of attention. Four acres of land planted with the mulberry, near Boston, have supplied food for as many worms as made 420 pounds of silk—worth \$2,50 per pound, or \$1,470; all of which were attended to by four girls, and only for a short period in the year.—This employment is well calculated for those, who are advanced, and also for those families in which there are many young children, neither of which would be very profitable in any other way. It is said, that the best method of cultivating the mulberry is to sow it broad cast, then the leaves may be mowed off and raked together for use, without much trouble. The leaves are also more tender than those, which grow on trees, a sufficient number of these however, must be reared to furnish annual supplies of seed.—*Dunstable, (N. H.) Gaz.*

To preserve seeds in a state fit for vegetation.—Fill an old cask about half full of moist earth; then put the seeds, those especially which are not of an oily nature, and consequently liable to spoil soonest, as near the centre of the cask as possible; then fill up the remaining portion of the cask with moist earth, ramming it tight, and heading the cask so as to make it completely air and water tight as possible, and stow it away in a place to which no salt water is likely to reach. In this way, seeds may be brought, with perfect safety, from the East Indies or New Holland.

Meat.—The consumption of Meat in London may be nearly ascertained by the annual sales of cattle at Smithfield market, which amount to about 156,000 head of large cattle, 30,000 calves, a million and a half of sheep, and 25,000 hogs.

Bread Stuffs.—The annual consumption of corn in London is about eight millions of bushels; four fifths of which are made into bread, and amount to 64 millions of qr. loaves. The Butter consumed is 11,000 tons. Cheese 13,000. Milk valued at nearly five millions of dollars;—Poultry, from 3 to 400,000 dollars. Game of various quantities.

Agriculture in Russia.—An economical Society and a school for the education of future agriculturists, have recently been established at Moscow, through the exertions of Prince Galitzin. "The branches of instruction are the following: the Russian language, book-keeping, agricultural chemistry, botany, the physiology of plants, the management of woods and forests, technology, farming, and the veterinary art. The course lasts 5 years. The Society publishes a journal in the Russian language, which has already accomplished much good."

It is proposed to light the city of Pittsburg with *Seneca Oil*. It is found in abundance floating on the surface of some of the creeks, and it is said that it might be furnished for twenty-five cents per gallon, if a market was opened for its use.

Fruit and Vegetables.—The neighborhood of London furnishes it with fruit and vegetables, and occupy about 6000 acres, which are laid out in gardens, and give employment to 30,000 persons in winter, and nearly 100,000 in summer.

SILK MANUFACTURE.

About six weeks since, Mr Douglas, a Scotchman, came to Windham, Conn. for the purpose of establishing himself in the weaving of silk ribbands.—To this he was led from the low rate of board and the great facility of obtaining good and cheap silk. He has wrought so long in his native country, and lately at New York, that his opinion ought, perhaps, to be entitled to some weight.—He stated to me, that it was his sincere conviction that he had never worked, or seen, from Italy or France, superior silk to that manufactured in Windham county, and those immediately adjoining; nor did he expect to see it better dyed than it was here.

It has been estimated, I believe, that silk to the amount of thirty or forty thousand dollars, is annually produced in this county; but this is probably much under the present proceeds. In Tolland, also, and some of the adjacent counties, it is largely cultivated. The quantity produced by single families, varies from 10 to 150 lbs. weight.—It is presumed that Capt. Storris, of Mansfield, has raised the present year upwards of 160 lbs. of silk. Here, then, is \$1080 gained without interfering in the least with the other products of his farm, besides affording an abundant supply of luxurious food for his pigs and poultry!—*Mass. Journal.*

To preserve flowers.—Gather them in various stages, from the young bud to the full-bloom blossom, and press them carefully between several folds of blotting paper, changing them into dry parts of the paper, every second or third day, until all their moisture is absorbed, then press them between the leaves of some book. The same caution apply to leaves, which should always be the most perfect.

Russian Tallow.—The amount of Tallow in the market of St. Petersburg, the last season, was 100,000 casks; of which 135,000 were sold at a reduced price from the previous years' sales; of course 25,000 casks remained on hand, to be disposed of at a still lower price.

It would seem from an article in the Portsmouth Times, that some person lately had a sound tooth pulled, and sold, to raise 50 cents to buy rum.

A Profitable Farm.—Mr Comfort Elliot, of Croden, N. H. has a farm of 80 acres, on which he has this year raised 175 bushels of grain and 1934 bushels of potatoes. He has this fall turned off, in stock, grain, butter, shoats, &c. enough to amount to over 500 dollars, and has a handsome stock left. He has hired but three months' labour during the season.—*Concord Gazette.*

A Kentucky paper says 20,000 sheep have been recently sold in that state, at prices averaging a bout 50 cents a head.

The Egyptians instructed the Greeks; the Greeks performed the same office to the Romans, and the latter have transmitted much of that knowledge to the world, of which we are in possession at this day.

Cadmus, in 1519, B. C. introduced alphabetical writing into Greece, from Phœnicia. The alphabet then had only sixteen letters; and the mode of writing was alternately from right to left and left to right.

Dr. Arnot says lying with the head lower than the body, is a better way of emptying the stomach than the new invented pump. [This is easier said than done.]

From the National Intelligencer.

INTRODUCTION OF FOREIGN PLANTS AND SEEDS.

The following circular, addressed by the Secretary of the Treasury to a portion of the American consuls abroad, in relation to the introduction of valuable foreign plants into the United States, is made public, in the hope that the object which it has in view may be the better promoted, by causing it to be more generally known.

Copies of the circular have been placed in the hands of the principal collectors, of whom they may be had by such masters of vessels, or others going abroad, as may be willing to aid in carrying into effect a design believed to give promise of public utility.

CIRCULAR.

Treasury Department, }
September 6, 1827. }

Sir—The President is desirous of causing to be introduced into the United States all such trees and plants from other countries, not heretofore known in the United States, as may give promise, under proper cultivation, of flourishing and becoming useful, as well as superior varieties of such as are already cultivated here. To this end I have his directions to address myself to you, invoking your aid to give effect to the plan that he has in view. Forest trees useful for timber; grain of any description; fruit trees; vegetables for the table; esculent roots; and, in short, plants of whatever nature, whether useful as food for man or the domestic animals, or for purposes connected with manufactures or any of the useful arts, fall within the scope of the plan proposed. A specification of some of them, to be had in the country where you reside, and believed to fall under one or other of the above heads, is given at the foot of this letter, as samples merely, it not being intended to exclude others, of which you may yourself have knowledge, or be able on inquiry to obtain knowledge. With any that you may have it in your power to send, it will be desirable to send such notices of their cultivation and natural history as may be attainable in the country to which they are indigenous; and the following questions are amongst those that will indicate the particulars concerning which information may be sought:

1. The latitude and soil in which the plant most flourishes.
 2. What are the seasons of its bloom and maturity, and what the term of its duration?
 3. In what manner is it propagated? by roots, seeds, buds, grafts, layers, or how? and how cultivated? and are there any unusual circumstances attending its cultivation?
 4. Is it affected by frost, in countries where frost prevails?
 5. The native or popular name of the plant, and (where known) its botanical name and character.
 6. The elevation of the place of its growth above the level of the sea.
 7. Is there in the agricultural literature of the country, any special treatise or dissertation upon its culture? If so, let it be stated.
 8. Is there any insect particularly habituated to it?
 9. Lastly—its use, whether for food, medicine, or the arts.
- In removing seeds or plants from remote places

across the ocean, or otherwise, great care is often necessary to be observed in the manner of putting them up and covering them. To aid your efforts in this respect, upon the present occasion, a paper of directions has been prepared, and is herewith transmitted.

The President will hope for your attention to the objects of this communication as far as circumstances will allow; and it is not doubted but that your own public feelings will impart to your endeavors under it, a zeal proportioned to the beneficial results to which the communication looks. It is proper to add, that no expense can at present be authorized in relation to it. It is possible, however, that Congress may not be indisposed to provide a small fund for it. The seeds, plants, cuttings, or whatever other germinating substance you may transmit, must be addressed to the Treasury Department, and sent to the collector of the port to which the vessel conveying them is destined, or where she may arrive, accompanied by a letter of advice to the Department.—The Secretary of the Navy has instructed the commanders of such of the public vessels of the United States as may ever touch at your port, to lend you their assistance towards giving effect to the objects of this communication; as you will perceive by the copy of his letter of instructions, which is herewith enclosed for your information. It is believed also that the masters of the merchant vessels of the United States will generally be willing—such is their well known public spirit—to lend their gratuitous co-operation towards effecting the objects proposed. I remain, respectfully, your most obedient servant.

RICHARD RUSH.

Directions for putting up and transmitting seeds and plants, accompanying the letter of the Secretary of the Treasury, of September 6, 1827.

With a view to the transmission of seeds from distant countries, the first object of care is to obtain seeds that are fully ripe, and in a sound and healthy state. To this the strictest attention should be paid; otherwise, all the care and trouble that may be bestowed on them, will have been wasted on objects utterly useless.

Those seeds that are not dry when gathered, should be rendered so by exposure to the air in the shade.

When dry, the seeds should be put into paper bags. Common brown paper has been found to answer well for making such bags. But, as the mode of manufacturing that paper varies in different countries, the precaution should be used of putting a portion of the seeds in other kinds of paper. Those that most effectually exclude air and moisture, are believed to be the best for that purpose. It would be proper, also, to enclose some of the seeds in paper or cloth that has been steeped in melted bees' wax. It has been recommended that seeds collected in a moist country, or season, be packed in charcoal.

After being put up according to any of these modes, the seeds should be enclosed in a box; which should be covered with pitch to protect them from damp, insects and mice. During the voyage they should be kept in a cool, airy and dry situation; not in the hold of the ship.

The oily seeds soonest lose their germinating faculty. They should be put in a box with sandy earth in the following manner: first, about two inches of earth at the bottom; into this the seeds

should be placed at distances proportionate to their size; on these another layer of seeds; and so on with alternate layers of earth and seeds. Until the box is filled within about a foot of the top, which space should be filled with sand, taking care that the earth and sand be well put in, that the seeds may not get out of place. The box should then be covered with a close net work of cord, well pitched, or with split hoops or laths, also pitched, so as to admit the air without exposing the contents of the box to be disturbed by mice or accident. The seeds thus put up will germinate during their passage, and will be in a state to be planted immediately on their arrival.

Although some seeds, with a hard shell, such as nuts, peaches, plums, &c. do not come up until a long time after they are sown, it would be proper, when the kernel is oily, to follow the method just pointed out, that they may not turn rancid on the passage. This precaution is also useful for the family of laurels, (*laurinae*;) and that of myrtles, (*myrti*;) especially when they have to cross the equatorial seas.

To guard against the casualties to which seeds in a germinating state may be exposed during a long voyage, and, as another means of insuring the success of seeds of the kinds here recommended to be put in boxes with earth, it would be well also to enclose some of them (each seed separately,) in a coat of bees' wax, and afterwards pack them in a box covered with pitch.

In many cases it will be necessary to transmit roots. Where roots are to be transmitted, fibrous roots should be dealt with in the manner herein recommended for young plants. Bulbous and tuberous roots should be put into boxes in the same manner as has already been recommended for oleaginous seeds; except, that, instead of earthy sand, as free as possible from earthy particles, should be used. Some of the bulbous and tuberous roots, instead of being packed in sand, may be wrapped in paper, and put in boxes covered with net work or laths. Roots should not be put in the same box with seeds.

Where the seeds of plants cannot be successfully transmitted, they may be sown in boxes, and sent in a vegetating state. Where more than one kind is sown in the same box, they should be kept distinct by laths, fastened in it crosswise on a level with the surface of the ground in which they were sown: and when different soils are required, it will be necessary to make separate compartments, in the box. In either case they should be properly marked, and referred to in the descriptive notes which accompany them.

When plants cannot be propagated from seeds with a certainty of their possessing the same qualities which long culture or other causes may have given them, they may be sent in a growing state. For this purpose, they should be taken up when young. Those, however, who are acquainted with their cultivation in the countries where they grow, will know at what age they may be safely and advantageously removed. They may be transplanted direct into boxes in which they are to be conveyed; or, where that cannot be conveniently done, they may be taken up with a ball of earth about the roots, and the roots of each surrounded with wet moss, carefully tied about it to keep the earth moist. They may afterwards be put into a box, and each plant secured by laths fastened crosswise above the roots, and the interstices between the roots filled with wet moss.—

The same methods may be observed with young grafted or budded fruit trees.

Where the time will permit it is desirable that the roots of the plants be well established in the boxes in which they are transplanted. Herbaceous plants require only a short time for this; but, for plants of a woody texture, two or three months is sometimes necessary.

Boxes for the conveyance of plants, or of seeds that are sown, may be made about two feet broad, two feet deep, four feet long, with small holes in the bottom, covered with a shell, or piece of tile, or other similar substance, for letting off any superfluous water. There should be a layer of wet moss of two or three inches deep at the bottom; or, if that cannot be had, some very rotten wood or decayed leaves, and upon that about twelve inches depth of fresh loam earth, into which the plants that are to be transplanted should be set. The surface of the earth should be covered with a thin layer of moss, cut small, which should be occasionally washed in fresh water during the voyage, both to keep the surface moist, and to wash off mouldiness, or any saline particles that may be on it.

When the boxes are about to be put on board the ship, hoops of wood should be fastened to the sides in such a manner that arching over the box, they may cover the highest of the plants; and over these should be stretched a net work of pitched cord, so as to protect the plants from external injury, and prevent the earth from being disturbed by mice or other vermin.

To each box should be fastened a canvass cover, made to go entirely over it, but so constructed as to be easily put on or off, as may be necessary to protect the plants from the salt water or winds, and sometimes from the sunshine. Strong handles should be fixed to the boxes that they may be conveniently moved.

During the voyage, the plants should be kept in a light airy situation: without which they will perish. They should not be exposed to severe winds, nor to cold, nor for a long time to too hot a sunshine, nor to the spray of the salt water.—To prevent injury from the saline particles with which the air is sometimes charged at sea, (especially when the waves have white frothy curls upon them) and which, on evaporation, close up the pores of the plants, and destroy them, it will be proper, when they have been exposed to them, to wash off the salt particles, by sprinkling the leaves with fresh water. The plants and seeds that are sown, will occasionally require watering on the voyage; for which purpose rain water is best. If, in any special case, instructions upon this point, or upon any other connected with the management of the plants during the voyage, be necessary, they should be made known to those having charge of the plants. But after all, much will depend upon the judicious care of those to whom trust may be confided during the voyage.

Plants should be watered, and particularly of the bulbous kind, before they are planted in earth, but in a moderate manner. The soil should be old lime, rubbish and vegetable matter, mixed in about equal parts, and should not be watered.

It may not be necessary, in every case, to observe all the precautions here recommended in regard to the putting up and transmission of seeds; but it is believed that there will be the risk in departing from them, in proportion to the distance

of the country from which the seeds are to be brought, and to the difference of its latitude, or of the latitudes through which they will pass on the voyage. It is not intended, however, by these instructions, to exclude the adoption of any other modes of putting up and transmitting seeds and plants, which are in use in any particular place, and which have been found successful, especially if more simple. And it is recommended, not only that the aid of competent persons be accepted in procuring and putting up the seeds and plants, but that they be invited to offer any suggestion in regard to the treatment of the plants during the voyage, and their cultivation and use afterwards.

(CIRCULAR.)

Navy Department.

Sir,—I have to call your attention to the enclosed copy of a communication from the Treasury Department to the consuls of the United States at various ports; and to desire that the objects of that communication may be promoted by you, on all occasions, as far as may be in your power.

The Executive takes a deep interest in this matter, and by particular attention to it, you will probably confer a lasting benefit to the country.

The letter of the Secretary to the Treasury is so full and satisfactory, that no further explanation seems necessary on my part.

You will be pleased to report to the Department what you do in execution of this object, and return the papers to the Department when you are detached from the vessel which you now command.

I am, respectfully, &c.

SAM. L. SOUTHWARD.

From St. John—(N. B.) Gazette.

SEED WHEAT.

In the Gazette of the 12th inst. we laid before our readers, such information as we had previously obtained, concerning a species of wheat, new in this country; and in consequence of the manner in which it was introduced, called "Tea Wheat,"* and on the 26th, we took notice of a communication in the Frederickton Royal Gazette, of the 18th, on the same subject, and extended our remarks. The very great importance of the subject, and its intimate connection with one branch of our agricultural interests, will, (we trust) be a sufficient apology for bringing it again, and thus early, under consideration. Our friend, (the editor of the Royal Gazette) who has taken a lively interest in this matter, on the 2d instant, states, that "he had received such additional information on the subject, as to produce in him a firm conviction, that the matter imperatively demands the most careful research." &c. The same Gazette contains a communication, relating to some wheat lately imported from Malaga, which also has the quality of resisting the effect of rust, &c. &c. We do fully and heartily concur with the editor of the Royal Gazette, and wish to give all possible publicity to those important facts.—The new crops not being broken up, the present season of the year is peculiarly favorable for this purpose, and affords a fair opportunity to all provident farmers, to take some measures, by exchange of wheat, or by purchase, to finally secure themselves as much as they can think proper, to the use of the new seed. We think it will be a gross and palpable mistake, on each person's, as omit to avail themselves of this opportunity.

* See N. E. Farmer, Vol. VI, p. 122.

time, of the valuable information thus circulated. The Royal Gazette, of the 2d inst. says as follows:—"We have already received such additional information upon the subject, as to produce in us a firm conviction that the matter imperatively demands our most careful researches, and the sincere cooperation of every practical farmer, and every man who has the interest of the country at heart." We have conversed with a gentleman who has made diligent and extensive inquiry into this subject, and who states, "that in no one instance, wherever the tea wheat has been sown this year, have the crops failed, or been tinged in the slightest manner with rust or smut." This is a striking fact—and the same individual has already bought up seven bushels of the tea wheat, every grain of which he will carefully preserve for seed, (giving other wheat in exchange) and we earnestly trust the example will be generally followed, and that those farmers who may not be disposed to part with it, will at least carefully preserve as much as possible from being ground.

Malaga Wheat.—We have this moment received the following communication:—
To the Editor,

Sir,—Having seen in your paper some notices respecting what is termed "Tea Wheat," and being acquainted with similar qualities in another parcel, casually brought into this Province, I beg to follow A. B.'s example, in calling the attention of the public to it through the medium of your columns. The original sample was brought from Malaga, in the Mediterranean, and first sown in the upper districts on this river—how long ago I cannot say, but it may now be procured in considerable quantities. Mr. Thomas Pickard sowed an extensive tract of land with it, and had it quite free from rust. Mr. William Wilnot sowed half a bushel of it last year, and although every other part of his wheat grounds were affected by rust not the least symptom of it appeared among the "Malaga Wheat." Mr. Benj. Sloat, sowed a peck of it in the midst of a field of the usual wheat of the county, and not a single stalk of it bore a rusted head, while all around the common wheat was much affected. There must be many other instances no doubt, if the facts were known, but these are surely sufficient; and the sources of information being at our doors, the matter should certainly be investigated.

I am, sir, yours, &c.

C. D.

In addition to C. D.'s favor, we understand Maj. Harding, of Manguerville, planted this year one bushel of the Malaga Wheat, which he expects will yield him at least fifteen bushels:—the grain of which is unusually large and full. Major Harding has also a large quantity of Tea Wheat in equally fine order.

A new variety of Oats.—Our agricultural friends will be gratified in learning that a new species of oats, possessing rare and estimable qualities, has been introduced this season into the Province. A few bushels of them, we understand, were imported by his Excellency, the lieutenant governor—sown, during the last spring, in a field upon the Peninsula—and have been found to mature and ripen nearly a month sooner than any oat which has yet been naturalized in our climate. They are productive, rise with a strong vigorous stalk, and are large and plump in the grain. The produce of the field, to which we have alluded above, will be preserved as seed for the ensuing season;

it will be sown during the next in the different quarters of the Province; and should it preserve its present qualities, and continue to ripen so early in future years as in this, it must be regarded as a benefaction of the most important character. Such an oat, in fact, has long been a desideratum in our agriculture. The species, which is now common in the country, lingers so long before it reaches maturity, that it delays the harvest beyond the most convenient periods, and crowd's the farmer's labor upon his hands. An oat which will ripen, as this does, before, or along with the early-sown wheat, will cause a more regular distribution of the toils of the harvest, bring the sheaf to the stack or barn in finer condition, and multiply at once the amount of food both for the family and for the stock. Notwithstanding Dr. Johnson's cynical definition of the oat—we are satisfied that the emancipation of Nova Scotia depends upon it—and that the universal introduction of a finer variety of that grain would tend to hasten the happy and prosperous event.—*Hollis's Novascotian.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, DEC. 21, 1827.

To Correspondents.—An article from Plymouth, on FISH, an *London and FISH LONDON, ANIMAL MAN, &c.*, will appear in next week.

INTRODUCTION OF FOREIGN PLANTS AND SEEDS.

The article on this subject, which we have given in this day's paper as emanating from a high official source, must be very gratifying to all who have the agricultural interests of the country at heart. The "directions for putting up and transmitting seeds," &c. appear to us to be (in general) correct and judicious. But the following assertion, copied from these "directions," is contrary to generally received opinions. They state, that, "the only seeds soonest lose their germinating faculty." The *Dictionary of Arts*, a work quoted by Dr. Deane, in his *N. E. Farmer*, says, "many sorts of seeds will continue good for several years, and retain their vegetative faculty; whereas others will not grow after they are one year old. This difference is in a great measure owing to their abounding more or less with oil; as also to the nature of the oil," &c. "Seeds of cucumbers, melons, and gourds, which have thick horny coverings, and the oil of the seed of a cold nature, will continue good for ten, fifteen, or twenty years," &c.—(*Flourishes in this country*.)

APPLE POMACE.

We are glad that the attention of agriculturists is turned to this substance, which in former times was considered rather as a nuisance than as an article of any value on a farm. A writer for the *N. E. Farmer*, (see Vol. II. page 51) states, in substance, that he had used pomace for manure, with good effect, after having mixed it with "a quantity of leached ashes, in the amount of one quarter of the bulk: this was heaped up and lay all summer to give the alkali a chance to work on the acid." The pomace, *thus prepared*, made an excellent manure for grass land. If it were mixed with *unleached ashes*, or a small quantity of quick-lime, just sufficient to neutralize the acid it would, no doubt, be found valuable as manure. But we think its best application is that pointed out by "*2d Brother Farmer*," in this day's paper.—It is not good economy, generally speaking,) to

convert any substance into manure, which is good and wholesome food for man or beast.

WOOD PECKERS USEFUL.

A senseless warfare is often waged by boys, and "children of a larger growth," against the *wood pecker*, a bird which is not only harmless, but useful. Some have supposed that these birds *injure* apple-trees, and other trees, the bark of which they perforate: but this is not the fact. They are in pursuit of the *borer*, and other insects injurious to the trees. Mr CORNELIUS COWING, of Roxbury, informs us that he lately found in the stomach of one of these birds, no less than 23 borers, which had been recently extracted, probably from orchards in the vicinity. The tongue of this bird is said to be sharp pointed, and bearded.—Having made a hole with his bill into the habitation of the insect, he impales it on the point of his tongue, and is thus able to extract and convert it to food.

BREEDING GEES.

We have just seen some young geese of this breed, raised by Colonel JARVIS of Charlestown, Mass. much surpassing any of their species,—which have ever before met our view. There were eight of them, hatched in the fore part of May, and fed on grass only, till ten days before they were killed; being then about seven months old. They weighed, after being dressed, on an average, *sixteen pounds each!* and were as fat, fair, and fine as any thing that an epicure ever flourished a fork over.

BREEDS OF DOMESTIC ANIMALS.

The choice of the best breed of horses, cattle, and hogs, which is too little regarded, is of the greatest importance to a farmer, and deserves his nicest attention. The expense is as great—may, many times greater, in keeping a creature of bad breed, as of a good, and the value is very different. Mr. Bakewell, (of the Dishley farm, in England) rendered himself famous by his breed of cattle. His principal aim was to gain the best, whether sheep or cow, which will weigh the most in the most valuable joints; and at the same time that he gains the shape which is of the greatest value in the smallest compass, he finds by experience that he gains a breed much harder and easier fed than others. In his breed of cattle, his maxim is, the smaller the bones the truer will be the make of the beast; the quicker it will fatten, and the weight will have a larger proportion of valuable meat.

The practice of Bakewell and his followers, furnishes an instance of the benefits of a division of labor, in a department of business, where it was little to be expected. Their noble stock was let out every year to breeders, from all parts of England; and thus, by judiciously crossing the old races, all the valuable properties of the Dishley variety descended, after three or four generations to their posterity. By no other means, could this new breed have spread so rapidly, nor have been made to accommodate itself so easily to a change of climate and pasture. Another recommendation of this plan was, that the ram hired had a choice among the number of males, of somewhat different properties, and in a more or less advanced stage of improvement; from which it was his business to select such as suited his particular object. These were reared by experienced men, who gave their principal attention to this branch alone: and having the best females as

well as males, they were able to furnish the necessary supplies of young males to farmers whose time was occupied in other pursuits. The prices at which Bakewell's rams were hired, appear enormous. In 1789, he received twelve hundred guineas for the hire of three brought at one birth; two thousand for seven; and for his whole letting at least three thousand guineas.—(*Encyc. Brit. art. Agri.*)

By proper management, Mr. Bakewell caused his cattle to be very gentle. His bulls would stand still in the field to be handled; and were driven from field to field with a small switch.—His cattle were always fat, which he said was owing to the breed.

Cross breeding, under judicious management, might probably be often employed to correct the faults of particular breeds, or to impart to them new qualities.—"Were I," says Sir J. S. Sebright, "to define what is called the art of breeding, I should say it consisted in the selection of males and females, intended to breed together;—in reference to each other's merits and defects. It is not always by putting the best male to the best female, that the best produce will be obtained; for should they both have a tendency to the same defect, although in ever so slight a degree, it will in general preponderate so much in the produce, as to render it of little value. A breed of animals may be said to be improved when any desired quality has been increased by art, beyond what that quality was in the same breed in a state of nature; the swiftness of the race-horse, the propensity to fatten in cattle, and the fine wool in sheep, are improvements which have been made in particular varieties of the species to which those animals belong. What has been produced by art must be continued by the same means, for the most improved breeds will soon return to a state of nature, or perhaps defects will arise which did not exist when the breed was in its natural state, unless the greatest attention is paid to the selection of the individuals which are to breed together.

"We must observe the smallest tendency to imperfection in our stock the moment it appears, so as to be able to counteract it, before it becomes a defect; as a rope dancer, to preserve his equilibrium, must correct the balance before it is gone too far, and then not by such a motion as will incline it too much to the opposite side. The breeder's success will depend entirely upon the degree in which he may happen to possess this particular talent.

"Regard should not only be paid to the qualities apparent in animals selected for breeding, but to those which have prevailed in the race from which they are descended, as they will always show themselves sooner or later, in the progeny: it is for this reason that we should not breed from an animal, however excellent, unless we can ascertain it to be what is called *well bred*: that is, descended from a race of ancestors, who have through several generations, possessed in a high degree the properties which it is our object to obtain. The offspring of some animals is very unlike themselves; it is, therefore, a good precaution, to try the young males with a few females, the quality of whose produce has been ascertained; by this means we shall know what sort of stock they beget, and the description of females to which they are the best adapted. If a breed cannot be improved, or even continued in the de-

gree of perfection at which it has already arrived, but by breeding from individuals so selected as to correct each other's defects, and by a judicious combination of their different properties (a position that will not be denied), it follows that animals must degenerate by being long bred from the same family, without the intermixture of any other blood, or from being what is technically called bred in and in.

Bakewell and Culley say "like begets like," therefore breed from the best. Of this says Sir J. S. Sebright, there can be no doubt, "but it is to be proved how long the same family, bred in and in will continue to be the best." Cross breeding appears no doubt more consonant to what takes place in nature than breeding from very near relationship; and arguing from analogy, the result of certain experiments made by T. A. Knight, on the vegetable kingdom, seems to justify us in concluding that occasional crossing may become not only advantageous, but even necessary for the purpose of correcting defects. Nevertheless, as the last mentioned writer and Cline observe, it can only be safely resorted to by skillful and experienced breeders."

Sir John Sinclair says that cattle will deteriorate by breeding from near relations; and "the same rule holds good regarding the human species. By a train of unfortunate circumstances, a brother and sister, German, ignorant of their close connexion together, were married. They had ten children, all of whom died before their parents."

FOUNDED OYSTER SHELLS MAKE GOOD MANURE.

At Holkham, in England, oyster shells are broken to pieces, either by passing them through oil-cake crushers, or repeatedly drawing a heavy iron roller over them when spread upon a stone, or hard burned brick-on-edge floor. A mill for crushing bark would answer the same purpose.—Forty bushels of this manure were drilled in the usual way, upon 27 inch ridges, slightly covered with earth, and the turnip seed sown upon it.—In the same field turnips were sown, on ridges of the same size, manured with farm yard dung, at the rate of 8 tons per acre. The turnips were a good crop on both pieces, no difference perceptible; the succeeding crop of barley, and the crop of clover afterwards, to all appearance, were equally good on both.

IMPORTANT NEWS.

On the 20th of October, a battle was fought between the allied fleets, and the Turko-Egyptian fleet, in the Morea, which terminated in the entire destruction of the latter. The Turkish fleet was attacked in the Bay of Navarin, at two o'clock. At 5 o'clock the first line of the Turks was destroyed, and their ships of the line and razeed frigates were sunk or burnt; and the remainder went on shore, and were burnt by their crews. Of this formidable armament, there remain only about twenty corvettes and brigs, and they were abandoned. A spectator of the combat calculated that there were 150 vessels of all classes engaged in the fight.

The report on the Lead Mines, gives a very satisfactory view of the importance of this property to the United States—the expected annual supply is equal to 10,000,000 pounds. A tythe of which, as rent received by the Government, will be more than sufficient for the purposes of the Army and Navy.

A nursery garden has been established in the city of Caracas by Dr. Fanning, (an American) for the purpose of collecting the most useful and ornamental plants of Colombia. He is also forming a botanic garden in the vicinity, under the patronage of Bolivar.

It has been calculated that the manufacture of wool, (including the various mechanics and laborers employed,) in the New England states, subsists about 20,000 families, or 120,000 persons; and that these will consume the surplus products of 40,000 families of agriculturists; together, about 300,000 individuals.

Sea Coal.—The annual consumption of Sea Coal, in London, is about one million and a half chaldrons.

Rare Production.—In the market yesterday, at the stall of Mr. Tower, was exhibited a lot of very large and beautiful lemons from the garden of the Rev. A. B. Howland, of Middlebury. They were chiefly attached to small boughs, the fresh and verdant leaves of which set off the fruit to fine effect. On one of these boughs no less than six lemons were hanging when plucked. The largest specimen of the lot measured seventeen inches round the longest girth, by thirteen in the smaller. Eighteen of these lemons with their stems, weighed together precisely eighteen pounds and two ounces. The display altogether was truly superb, and the more gratifying from being the production of our northern climate, offered at this inclement season. The fruit, we understand, was gathered for the purpose of relieving the tree which bore it of a part of its redundant stock, and to aid the growth of another vigorous crop. It is not surprising to witness the silent course of nature, pursuing her operations in unaltered regularity, offering lessons of order for human imitation, and teaching that as a good tree is known and prized by its fruits, so every public servant whose political worth stands approved, should be duly estimated by the community whose interests he promotes, and as he repeatedly yields those tokens of continued confidence and favor, which may incite him to bring forth more abundantly his fruit into perfection.—*Continued.*

Silk.—In Norton's & Russell's State Register, it is stated, that "in the town of Mansfield, in this county, is annually raised upwards of 3,000 pounds of silk, which in raw state is estimated to be worth a fair valuation, from 12 to 13,000 dollars, and when manufactured into skeins and prepared for market, is worth from 13 to 20,000 dollars. The labor is chiefly performed by females and young persons.

The growing and manufacturing of silk is becoming more extensive in this country, and the attention of many public spirited individuals has recently been turned to it. That it may be made profitable, and a source of great wealth, cannot be doubted when we look at the single instance of the town of Mansfield. That town has less than three thousand inhabitants and comprises an area of only about forty-six square miles—its soil is less productive than that of many other towns, yet the industrious inhabitants in addition to their other employments, from which the culture of silk does not detract, contribute to bring in a yearly revenue of about 20,000 dollars. What an inducement is here held up to the industrious and enterprising, and if imitated, how long should we be dependent on the old world for silk?

Literary Generosity.—The Providence American relates an account of a gentleman, known only by the designation of A. B. who had volunteered and actually rendered his services, in three different towns in Rhode Island, as a teacher of a school for several months in each, free of any expense; and when his board was offered to be paid, he declined the offer. After finishing his services in one town, he left fifty dollars with a qualified female who had attended his school, that she might continue the school in the summer month. He still remains "the unknown Teacher." Under date of Oct. 1, in the Newport Mercury, he again offers to teach a school in Coventry, R. I. and has probably commenced.

At Taunton, Mass. 1,200 tons of nails are made annually, and three hundred tons of plates, hoops and machinery. At Passburg, there are seven rolling and slitting mills, eight air founderies, six steam engine factories, one wire factory, &c. Some of these are very large establishments—one of them has two engines of 100 and 120 horse power.

Brewn Geese.

For sale, by Samuel Jaques, Jr. Charlestown, 20 pair Bremen Geese, at \$10 per pair.

White Mustard Seed.

For sale, at the office of the New England Farmer, the best English White Mustard seed, by the pound or bushel.

Trees, Ornamental Shrubs, &c.

MR WINSHIP offers for sale at his Nursery, in Brighton, the largest variety of Fruit and Ornamental Trees, Shrubs, &c. His collection of Fruit Trees is large and well selected, and his variety of Ornamental Shrubs, &c. very extensive, embracing the Rose Arceuth, Thoe thorn, Anemone, Grand Aconite, double-flow orange Almond, red and white Albion, Bladder nut tree, Begonia Radiosa, Burnage Lust, &c. &c. &c. Flowering Chestnut, select of flowering Catalpas, Double, Daphne Pink, Marzocani (first flowering shrub) variety of Gages, variety of Honey suckle, English Malvins, Weeping willows, Cameraria, St. George, La baronia, Smoothb, Blumford, B. spicata, Platan, Pecan nut trees, Mountain Ash, Ladies Tree, purple globe tree, Japan pear, Japonica chlorocarpa, &c.—Orders for any of these articles left with Mr. Russell, at the New England Farmer office, will be executed on the same terms as at the nursery, and delivered in Boston, free of expense.—Catalogues furnished gratis.

Brewn Geese.

FOR sale, 10 pair superior BREWMEN GEESSE. Apply to THOMAS WILKINS, Nodd's Island, or to Mr. Russell, at the New England Farmer office. Dec 7.

For Sale.

TWO large, well-bred and general breeders, with food by the celebrated Lapporter or *Baltimores*. These animals are perfectly bred to the stall and all kinds of business—will work before oxen, and are perfectly kind and good travelers. Ten persons will manage to breed from this pair. Apply to our office not far from the City of WILD GEESSE.

Apply to DEKA, AUSTIN, near Mr Greenough's on Cambridge in Newton, or to J. B. RUSSELL, at the New England Farmer office, Boston. Dec 7.

MISCELLANIES.

[From the Bijou, for 1823.]

ON A LITTLE GIRL.

BY WM. FRASER.

That beautiful and stary brow,
 With youth and joy all splendid now—
 Can it be marred by years?
 That passionate and stainless breast,
 Where innocence hath raised her ne-
 Most it be racked by fears?
 That glowing cheek and sun bright eye
 Whence laughter wings its archery—
 Will it be stained with tears?
 Such is, alas! the bitter doom
 That waits each infant to the tomb;—
 And how canst thou, young bud of beauty, be
 Excluded from the pale of destiny!

But years will pass nor leave behind
 The stain upon thy dear old mind—
 Then, come, thou fearful age!
 And fears that rack thy breast may prove
 The token sure of passionate love—
 Such is love's hermitage!
 And tears from pity's fount will flow,
 And on the cheek, full sunny glow,
 Of joy the fond presage!

Thy days shall onward egl thy way,
 Like the music of fragrance-breathing May,
 It shall greet thee thy beauties to enshroud,
 It shall give thee life on April cloud.

W. F. F.

Prize well our Christian Sense of old,
 Lov'd when thy year our course had roll'd,
 And brought blithe Christmas back again
 With all its hospitable train.
 Oh! Christmas, ever, thy days were rung—
 Oh! bright as ever, were our childish sung!
 Thy songs thy songs on could the year
 Thy room's heart beat, that fill'd the year
 Itched to be home, and fill'd the year
 And general was the happy cry,
 "That to the village, to the village,
 Brought tidings of a happy day."

CHURCH GOERS.

So lovely, had I death
 And such a welcome as
 I have—my heart
 And mine—my heart

Why is it that *Eliza Miller's* *Confessions*—Why
 do you struggle like a white man? Because he is
 a white man.

Why is it that you are about to take a glass of brandy,
 when you are going to beat his wife? Because he
 is a white man.

Why is it that you are about to take a glass of brandy,
 when you are going to beat his wife? Because he is
 a white man.

Why is it that you are about to take a glass of brandy,
 when you are going to beat his wife? Because he is
 a white man.

Why is it that you are about to take a glass of brandy,
 when you are going to beat his wife? Because he is
 a white man.

Why is it that you are about to take a glass of brandy,
 when you are going to beat his wife? Because he is
 a white man.

Why is it that you are about to take a glass of brandy,
 when you are going to beat his wife? Because he is
 a white man.

Why is it that you are about to take a glass of brandy,
 when you are going to beat his wife? Because he is
 a white man.

the witty Joseph Miller has recorded it in his laugh-
 ter stirring volume. A painter was desired to make
 a hatchment, on which was the motto "Sic transit
 gloria mundi." It so happened that he was desired
 to deliver in his performance on a Monday; it was
 not however, finished before the succeeding day,
 and as a proof of his attention and accuracy, he
 altered the motto, and delivered the melancholy
 emblem of death to his customer, with the follow-
 ing alteration, "Sic transit gloria Tuesday".

The day of small things.—A dealer in cat and
 dog meat, in London, has lately placed over his
 door, in golden capitals, the following words,—
 "cat and dog meat bazaar."

Pedlars.—About the year 1821, the good State
 of Massachusetts swarmed with a race of long-
 sided, cunning, guessing, question-asking, hypo-
 critical, bargain-making rogues, who prosecuted
 their trade with indefatigable diligence.

The pedlar, taking his cargo of tin trumpets, or
 adulterated essences on board a vehicle, looking
 more like a miniature of Noah's ark when it rested
 on the mountains of Millbury, than any christian
 conveyance—or picking his needles and thread,
 his combs and calicoes, in a huge box strapped
 over his shoulders, roaming to and fro on the
 earth, seeking whom to cheat. His home was
 every where, and his dwelling place in all habita-
 tions of man or beast. You might find him in the
 public room of the tavern, round the fire-side of
 the farmer, or snugly rested in a corner of the
 barn. The rising sun shone upon his path among
 the hills of the north, and his declining beams
 lit the eternal pedlar on his way to the sea
 shore. He intruded himself on the domestic priv-
 acy of every home, and his inexhaustible elo-
 quence yielded him many a penny of profit on his
 miserable wares. Sometimes with the harry en-
 terprize of New England character he crossed
 the mountains, and vended his wooden nutmegs
 and pumpkin seeds among the astonished natives
 of the west, whose exhausted purses and length-
 ened faces bore testimony to the superiority of
 Yankee skill in cheatage over their own ingenu-
 ity. True it was, the farmers' children had their
 teeth set on edge by eating sand instead of sugar,
 and our village bells often mourned over the
 transitory splendor of her go-to-meeting gowns—
 and the sick man died after taking the poisonous
 slug; but still the pedlar was a favorite visitor,
 and his sales grew great when resting on such a
 prolific source as public credulity. These golden
 days, however, could not always last. Our politi-
 cal fathers issued an edict to prohibit the trade of
 the itinerant merchant, and wandering vagrants
 were compelled to betake themselves to other
 states. The terror of the law, for a space, freed
 the good people from the visitations of these vag-
 rants—but in process of time finding the statute
 showed its teeth without biting, they began to re-
 turn and infest our borders. Within a few years,
 their depredations have been bold and frequent
 (Harvard Review).

Early Marriages.—A moral correspondent of
 the Portland Patriot thinks it would be advanta-
 geous for females to pass their twentieth or
 twenty-fifth year, before they subject themselves
 to the cares and fatigues of a married life; as the
 constitution of hot young women can be regarded as
 finally established until after their twentieth year.
 Every female who does not have an offer to her

taste previous to that age, will applaud his advice,
 but such as may meet with husbands to their mind,
 will judge of their own fitness, and laugh at the
 Doctor.

A fine woman ought to add annually to her ac-
 complishments, as much as her beauty loses in
 the time.

Winter Evenings.—The intelligence and often
 the success of farmers, depend on the manner
 their Winter evenings are spent. The privilege
 of devoting them to the acquisition of useful infor-
 mation, is not enjoyed so uninterruptedly by any
 class.—The farmer's pursuits of the day invite
 him to draw near the fire; and if he has a taste
 for useful reading, particularly for that connected
 with rural pursuits, we scarcely can imagine one
 to spend his time more rationally and happily.—
 Knowing that all his live stock are well fed and
 taken care of, and harassed with none of the anx-
 ieties of those whose business is connected with
 thousands, and liable to ten thousand reverses, he
 can give his mind wholly to the sentiments and
 reasonings of his author.

But many, who cannot command more than one,
 two, or three hours at a time, excuse themselves
 from reading alto ether. The father acts on this
 principle, and the sons follow his example; and
 thus it is that there are not more extensively read
 and enterprising farmers. Let us now make some
 calculation of the time that could be employed in
 the acquisition of useful information, from the age
 of fourteen to fifty.—Suppose that three hours of
 the twenty-four, for four days of each week dur-
 ing the six Winter months, were spent in useful
 reading. This would amount when he would ar-
 rive at 50 years of age, to 11,250 hours. If he
 read 50 pages per hour, it would be 224,640 pages.
 Allowing each volume to contain 224 pages,
 it would amount to one thousand volumes. Now,
 what would be the result of thus devoting this
 small portion of his time? It would give a right
 bent to his mind—tend to prevent him from spend-
 ing his time and money at improper places—he
 would become acquainted with the state of agri-
 culture in his own country, and in others—he
 would become enterprising, and be enabled to use
 to better advantage the means within his reach, and
 thus become a more successful cultivator of the
 soil. In fine his taste for knowledge would in-
 crease; he would become a more valuable citizen,
 a blessing to his friends and neighbours, and
 more likely to descend with grey hairs in repose
 to his grave.—W. F. Farmer.

Superior Tallow.

For sale at the office of the New England Farmer, a further
 supply of Dutch Tallow, of a superior quality.
 Also, a variety of POTAE, OILS, &c. with every variety of Geo-
 graphical, &c. &c. &c.

Farmers' Almanac.

The sale of this Almanac, for the year 1828, they are de-
 sired to say, is now in progress, and the public are invited
 to purchase it as early as possible, in order to have it in time
 for their use.

Now published by the Author, for 1828.

Just published by the Author, for 1828, a further
 supply of Dutch Tallow, of a superior quality, and in the
 quantity of 1000 lbs. Also, a variety of POTAE, OILS, &c. with
 every variety of Geographical, &c. &c. &c.

THE FARMER is published every Friday, at \$3.00
 per annum, or \$2.50 if paid in advance.
 Gentlemen who promise for responsible subscribers
 are entitled to a sixth volume gratis.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

BEES.

MR FESSENDEN—I offer no apology for recurring again to the subject of the honey bee since you have encouraged me to that effect in the *New England Farmer*, 7th December. I have, however, no pretension to experimental or practical skill in their management, and possess but a small share of information derived from books, (having always been an advocate for book knowledge) and from verbal communication.

The fact stated in your last paper of a snail entrapped in a hive,* brings to my recollection a few circumstances equally calculated to excite the admiration of your readers.

On taking up a hive in autumn a few years since, the body of a mouse was found entirely encased in the substance of the comb, and so effectually embalmed by their own materials as to exclude the access of atmospherical air, and to obviate the possibility of annoyance from the process of putrefaction.

During a warm day the last summer, I witnessed the surprising alacrity with which bees can repel the attacks of an enemy. A large humble bee, and a very large ox fly, after being deprived of one wing, were thrown on the projecting board of my bee hive; they were instantly attacked by as many bees as could have access, piercing their bodies with their stings till they expired, and then forcing them from the hive to the ground. From this it may be supposed that were the bee-moth to make its pillaging visit at mid-day instead of skulking in the dark, it would be entirely foiled in its base attempt.†

In Rees's Cyclopaedia or the Edinburgh Encyclopedia, I have read the following curious statement. In autumn 1804 the copious collections of honey which had been made during summer had entirely disappeared, and the moths were uncommonly abundant. The owners of a number of hives resolving to protect them from further pillage, closed their entrances with tin gratings, where the apertures were proportioned to the size of the bees on the 17th September: but not having enough for the whole, two were left unsecured. It was seen next morning on examination that during the night the bees had themselves taken the necessary precautions by contracting the entrances of their hives so as to make them quite safe against invasion. Each was completely blockaded by a wall composed of old wax and fu-

rina, in which the bees had taken care to leave apertures corresponding to their own size: two that would prevent above two bees passing at a time were fashioned like inverted arches; a third was broad enough in front to admit of the passage of several bees at once, but so low that they were obliged to lean over on one side to get through. All the other hives proved on inspection to be constructed in the same way, even where provided with the tin gratings. In other instances the bees had constructed a double wall at the entrance of the hive, with covered galleries so narrow that no more than a single bee could pass; fifty-three swarms began these operations in the course of the same night. In countries where their great enemy the sphinx atropos abounds, the apertures when the chief collection of honey takes place, must be made very low that this insect may be excluded.

The following instance might, in the view of some, justify an impeachment of the integrity of the instinctive faculties of these insects. It was copied from the *New York Medical Repository* a few years ago, into the *American New Dispensary*, by the present writer, as tending to prove the virulent nature of the *Rhus Vernix*, or swamp samach. A swarm of bees attached themselves to a branch of the *Rhus Vernix*, after which the branch was cut partly through, and for some reason the bees were suffered to remain; the next morning the whole swarm were found dead and their bodies turned black and swelled to nearly twice their natural size. Now it is well known that instinct in animals enables them to distinguish and to avoid those poisons which prove destructive to their own nature; by what means therefore, was their instinct confounded in this instance? Not perhaps from any error in the choice made by the bees; had the tree remained in its natural state, they might probably have continued to adhere to the branch with impunity; but in consequence of the wound by the knife, the poisonous effluvia was suffered to exude and exert its fatal effects upon the innocent visitors.

In my former communication it was mentioned that the garret of a friend was occupied by a family of bees; they took possession of the tenement in June 1825, and first formed in a body on the side of the chimney. They first made their entrance through a crevice under the edge of the shingles, but an aperture was bored for their use a little below the roof which has proved acceptable to them. They now occupy the space between the chimney and the upright gable end of the house, open at both sides of the chimney for the space of about 7 inches in width. They have suspended their comb in lengthened sheets extending about two feet below the aperture, carefully leaving a space round it to pass and repass. The quantity of comb, would, it is supposed, nearly fill a barrel, and the landlord receives his rent from the produce of his tenants at his own discretion, selecting the young comb containing transparent virgin honey. They have never swarmed, as they have ample accommodations for their stock of honey and their young brood.

There appears no circumstance in the arrangement of an apiary so difficult and at the same time

so important as that of guarding against the depredations of the bee moth; every cultivator of bees complains that more or less swarms become victims to this enemy every season, in despite of all their efforts to frustrate its invasion.

The fact above detailed of the successful location of a swarm in a garret, might suggest an important improvement in the arrangement of an apiary. Let the hives be placed in the upper apartment of a dwelling house, or some out building provided with proper apertures through the walls. In this situation the bees would be secured from the vicissitudes of the weather, the hives would be less liable to decay, and the expense of a common bee house would be saved. But the most important advantage would be that of a late security against the attacks of the unskilful bee moth, as that insect seldom or never penetrates to any considerable height in the atmosphere, and there could be no sweet odour from the hives to allure the insect to the place to seek for its favorite food. It is moreover not impossible but that young swarms from the hives so situated may attach themselves to the walls of the apartment for their permanent residence, as in the garret above mentioned, and thus in process of time the whole apartment be converted into a convenient and profitable apiary. Should these suggestions elicit the observations of some judicious and experienced cultivators, the object of this communication will be in a measure attained.

Old Colony, Dec. 17, 1827.

MEDICUS.

OATS.

MR FESSENDEN—There is a difference of opinion among farmers as to the proper time for sowing oats. While some contend that it is best to sow as soon as the frost is out sufficiently for the land to be worked, others insist on a different course, and choose not to sow until the ground has become quite dry and warm. It may be a fact that late sowed oats in some and perhaps in most instances, produce a greater quantity of straw than those early sown, and it may be and probably is true in as many instances, that the grain is proportionably lighter, so that if weight of grain is the prime object, that course of procedure as it respects sowing, is best, which is most likely to produce the desired result.

There seems to have been a general failure in the crop of oats through this part of the country the past season, there being but few instances, where they are so heavy by one third, as they have been in other years, when no calamity has befallen them.

Notwithstanding the general failure, I had as good a crop of oats the past season, as in any former year, having over one hundred bushels, from little more than two acres of ground, weighing thirty-three lbs. per bushel. Such being the fact, it is a question with myself and others, what should be the cause of my obtaining a better crop than any other farmers in the neighborhood.—That which to me appears as the probable and only cause, is early sowing. Although my ground was in no better condition than land in general, I sowed my oats several days earlier than other farmers in the vicinity.

* See page 162 of the current vol. of the *N. E. Farmer*.

† In speaking, we believe, of this insect, M. Raumer says, "The bees would readily destroy these creatures, were it not for the armour they are covered with. They form themselves a coat of armour of a double matter. The first, next to the body, is a kind of silk of their own spinning; and the outer covering is of bees wax laid on considerably thick. The creature, just thrusting its head out to feed, goes on devouring the cells; while the bees are buzzing about him, attempting in vain to pierce him with their stings. He never forsakes his covering, but lengthens and enlarges it as he goes; and gnawing down the sides of the cells in his march, without staying to eat them one by one, the destruction he occasions is scarcely to be conceived." *Editor of the N. E. Farmer.*

There were several fields contiguous to mine, where the soil and cultivation were not essentially different, but which were sowed a few days later, which in every instance failed to produce a middling crop. I have always been in the habit of sowing my oats as soon as possible after the ground had become settled, believing it to be the better way, and observation and experience the past season, have only strengthened my belief, that such a course is the correct one.

A. FARMER.

Remarks by the Editor.—Deane's N. E. Farmer states that "Oats cannot be sowed too early in the spring after the ground is thawed and become dry enough for sowing. The English farmers sow them sometime in February." Loudon says "The season of sowing oats is from the last week in February to the end of April. About the middle of March is preferred by the best farmers." We believe, as a general rule, neither oats nor any other sort of spring grain can be sowed too early after the ground can be put in order to receive the seed in the spring. Early sown spring wheat as well as oats is much less liable to blast than such as is put into the ground late in the season.

FOR THE NEW ENGLAND FARMER.

FRUIT TREES.

Linnaean Botanic Garden,
Dec. 11, 1827.

DEAR SIR—I send you herewith some parts of my Treatise, now in press, which you can publish as "Extracts from Prince on Horticulture."

Yours most respectfully,
WM. PRINCE.

NOMENCLATURE OF FRUITS.

During a number of years, the author has been engaged in a most extensive and general investigation of all the fruits that have been introduced to this country from abroad, in order to test their accuracy, and the correctness of their names.—This critical inquiry has convinced him, that not less than one hundred varieties of the different fruits at present cultivated in this country are incorrect, as to the identity of their names, and consequently quite different from those they are intended to represent. This has arisen either from errors being made when they were sent from Europe, or by established names being adopted here for doubtful fruits. The author himself has, in common with others, been grossly deceived in the varieties of fruits from Europe, even when received from the best nurseries of England and France. This has long since led him to scrutinize every variety he receives, and the original tree is invariably planted out for bearing, that its accuracy may be tested. The author has gone into these remarks, to account for any present differences which exist between fruits from his establishment, and others bearing similar names, as above one hundred kinds will be found to essentially differ both in appearance and quality. Those persons who are conversant with DuRoi's, the Luxembourg Catalogue formed under the auspices of the French Government, the *Ron Jardinier*, and other French publications; or with Miller, Forsyth, Speechley, and the publications of the London Horticultural Society, can have the identical fruits sent them that are described in those works, and, in every case, the identity is guaranteed.

SYNONYMS IN FRUITS.

The author is taking extreme pains to regulate these properly and conclusively, as so much of the success of horticulture depends on critical accuracy. The Catalogues of his establishment bear witness to his anxiety, that the same fruit should never be disseminated under a plurality of names, and it contains more synonyms attached to the respective fruits than any other publication existing; but the author intends, in his "American Horticulture," to extend this necessary part of horticultural information, so as to set at rest a great many of the errors which have hitherto existed, in consequence of a want of information on this head.

I was highly amused, on calling to see a peach which an acquaintance of mine called by the charming name of "Maria Antoinette," to discover, that it was the identical fruit which has been long sold as the "Yellow Rareripec," and which originated in a field about two miles from my residence, whence I obtained it, and called it by the latter title. I have also noticed, that a peach, which is now selling as a new variety, by the high sounding name of "Emperor of Russia," is the same fruit known for 30 years past under the unpretending title of "Serrated Leaved Peach." Various other instances of this kind have come within my notice, which it is unnecessary to enumerate. There is nothing more calculated to lessen the satisfaction of the horticulturalist than this rechristening of old and well known fruits, either by the name of the person who happens to find a tree growing in his garden, or with some fanciful productions of his imaginations, as it will create the same endless confusion that has for a long period existed in England, and which their Horticultural Society is now attempting to remedy for it is a fact which can be proved, that many of the fruits of Europe may at present be obtained with more accuracy from some of the American nurseries than they can, in most cases, either in England or France.

ACCLIMATION OF FRUITS.

Deciduous trees, natives of the same latitude, are far more hardy than evergreens; which proves that the foliage of the latter possesses, even in winter, a great degree of sensibility. Efforts, therefore, to naturalize the fruits of the warmer climates, should be in preference commenced with those which are deciduous. The deciduous trees of Portugal, Italy, and Spain, and of South Carolina, Georgia, and Louisiana, will endure the winters of New York, when the evergreens, from the same places, perish if unprotected. Though in England, where the winters are more moderate, these survive and flourish, while, from the want of heat in their summers, many of the deciduous trees do not ripen their wood sufficiently to support their climate in winter; whereas, beneath the powerful sun of our country, the wood becomes so well matured, that, in many instances, resists the rigours of our winters uninjured. A consideration of these circumstances, and effects of climate may greatly aid those concerned in the acclimation of trees calculated for fruit or for ornament.

VERSATORY TREES.

As a prejudice has prevailed from time immemorial, that trees, hay cattle, when removed from a rich to a poorer soil, cannot thrive; and as nur-

very grounds are generally supposed to be kept in the richest possible state, it is a duty which the author owes to himself to remark, that, for many years, he has not made use of as much manure on his grounds as is commonly put on the same quantity of ground by farmers in their usual course of agriculture—not from any belief in the above mentioned doctrine, but from motives of economy, resulting from actual experiment, he has substituted culture for manure, by having his grounds, previously to planting, ploughed more than twice the usual depth, and by having the ground each year dug alongside of the rows of trees. By this management they are continued in the most thrifty state until the period for transplantation. The doctrine of trees not thriving when removed from rich to poorer soil, has long since been exploded in Europe. Marshall, a celebrated English writer, is very particular on this subject, and gives instances that have come under his observation to prove its fallacy, in his "Rural Economy of the Midland Counties of England," vol. i. p. 85. It is absolutely necessary that the young trees, at the time of transplanting, should be vigorous and thrifty, and it is of no consequence whether this is produced by strength of soil or by culture, as the young trees will then have a constitution prepared to feed itself on coarser food.

To those who insist on the point that nurseries of trees should be reared on poor ground, the reply may be made, that it might, with equal aptitude, be asserted, that a decrepid man is the best calculated to sustain the toils of a journey.

ORCHARDS NEAR THE SEA-SHORE.

It is recommended, in localities wholly exposed to the ocean—such as Nantucket, and other islands—that those who desire to succeed in cultivating fruits, should first plant a row of red cedars, willows, or other hardy trees, to break off the gales; next to these, they might plant their pears, as the fruit best calculated to support the situation, and after them peaches, and other fruits; perhaps it would be better that the cordon of cedars, willows, &c. should be extended on three sides of the plantation. As the red cedar flourishes uninjured on the sea-shore, and from its being an evergreen, is capable of affording protection against storms in all seasons, I consider it as decidedly the most proper to be selected for the before mentioned purpose.

ON RAISING WATER FROM WELLS.

MR FESSENDEN—If you think the following account of my manner of bringing water into the yard, will contribute anything to the convenience of farmers, you are at liberty to insert it in the *New England Farmer*. Yours, &c. N. L.

Lyne, (N. H.) Dec. 26.

Last autumn, wishing to have water constantly running to my barn yard, and pasture contiguous, I went back about 18 rods to ground 44 feet higher than my yard, there dug and stoned a well 20 feet deep, and dug a trench 2½ feet deep—placed in it a small leaden pipe—stopped the lower end of it, and let it extend up beyond the well's mouth, so far that when bent and inserted, it would reach to the bottom—then filled the pipe with water for the purpose of exhausting the air (having no other convenient way of doing it)—stopped the upper end till the pipe was carefully bent, and the end put under the surface of the water, then took out the stopper and fixed on a leaden strainer, and

fastened a cord near the end of the pipe, and let it down nearly to the bottom of the well—confining the other end of the cord to a stick fixed across the well, near the top. The use of this cord is to raise the end of the pipe, in case we find at any time by measuring, that the sand is washing in—and liable to cover the strainer, and thus stop the water. Then by removing the stopper from the lower end, the water began to run, and has continued running a small stream ever since, without danger of exhausting the well, which, in the present wet season, contains fifteen feet of water.

From the New York Statesman.

AGRICULTURE.

We are happy to perceive by the subjoined correspondence, that the spirit of improvement in agriculture, cherished by the munificence of the Government, and widely diffused through the medium of societies under its patronage, is not yet extinct though it seems to have slumbered for a year or two, while public attention has been engrossed by canals, rail-roads and other plans for promoting the interest of the state. The former ought to have been done, and the latter not left undone. Agriculture must for centuries be the great source of wealth and prosperity in the United States. Commerce and manufactures cannot flourish, if this paramount interest, whence they draw their life and activity, be permitted to languish. We have always had full faith in the salutary influence of agricultural societies; and it is with us a subject of deep regret, that the enthusiasm by which they were actuated a few years since, has in any degree subsided. Brief as was "the full tide of successful experiment," and sudden as has been its reflux, it was like one of those inundations of the Nile, which bring down fertility and plenty. The traces of the vivifying and invigorating principle are visible over the whole surface of the state;—and in many instances, waste places have been converted into productive farms. Look, for example, at the rural retreats of the late Chief Justice and his neighbour Judge Buel, whose fertile acres were reclaimed by the hand of persevering industry. If such an impulse was communicated to agriculture by a few seasons of active exertions, what effects might not be produced by systematic and continued efforts, such are made in Great Britain and in some parts of our own country? We have all the elements of one of the richest agricultural countries in the world, with every possible facility of transporting produce to a ready market. With such peculiar advantages, and with a population rapidly increasing, the state of New-York presents the strongest inducements for improving every acre of its soil.

In giving publicity to the following letters, we will merely add, that it will afford us pleasure at all times to make the Statesman the medium of similar communications, believing that if we may be the means of "making two blades of grass grow, where but one grew before," a service more beneficial to the community will be performed, than by filling our columns with angry discussions on the subject of the Presidency. Without censuring any of our editorial brethren, who have a taste for the turmoils of party strife, we can only say for ourselves, that we would rather be found

"Roasting turnips on a Sabine farm"

than engaged as heated partisans for this or that

candidate, playing at cut and thrust in the political arena, for the amusement of the public:

New York, Nov. 26, 1827.

DEAR SIR—When I was at your farm last summer, I observed a field of *Lucerne* in luxuriant growth, and of great promise. Your absence from home prevented my learning the particulars of its culture, uses and value.

This grass, I think, is not grown to any considerable extent in Great Britain or Ireland. In passing through those countries a few years ago, I do not recollect to have seen it all. Perhaps the humidity of the climate, the nature of the soil, and the strong growth of the other *finer* grasses, may account for its absence. In France, however, I found it held in great esteem; it produced abundantly, allowing of four or five cuttings in a season, and was used in its green state for *soiling* cattle.

Your experiments have, no doubt, been made with care. A detailed statement of them will be of service to our agricultural interests. If you will oblige me by furnishing the statement, it will gratify me to be the medium of communicating it to the public. Yours, very respectfully,

I. M. ELY.

Hon. JESSE BUEL, Albany.

Albany, Dec. 7th, 1827.

DEAR SIR—I most cheerfully comply with your request, in communicating my experiments in the culture of *Lucerne*.

My first essay to cultivate this grass was made in 1820. I sowed it with summer grain, but too thin; the summer was dry, and not more than a fourth of the plants survived till autumn. I ploughed it up at the end of the second year.

In 1824 I sowed 16 lbs. seed on an acre, well prepared by manure and potatoes the preceding year, with half a bushel of winter rye, the whole broadcast. The ground was well barrowed and rolled after it was sown. The rye soon spread its leaves upon the surface, and protected the *Lucerne* until its roots had good hold of the soil. It grew well, notwithstanding the drought. The latter end of August, perceiving that some of the rye was pushing up seed stalks, and that some weeds were overtopping the grass, I mowed it, and fed it green to my cattle. In 1825, I cut three tolerable crops, and soiled it to my cows.—In 1826, I cut it four times for green fodder, and in the autumn gave the field a slight top dressing of rotten dung. This year my stock has consisted of six cows and four oxen. My summer pasture would not more than suffice for two of them.—I fed them on ruta-baga and hay until about the 20th May, when I commenced cutting and feeding my *Lucerne*, morning and evening, in such quantities as I found my cattle would consume. By the time I had cut over the acre, the part first mown was again fit for the scythes. Two cuttings with the small pasture in which the cattle run, sufficed until my meadows and grain fields were fit to turn into. A third crop was cut for hay, and fourth might have been cut also, but for the difficulty of curing it. This is the field which you saw when at my house.

* The botanical name of this plant is *medicago sativa*. It is a native of Spain and the south of Europe. It grows to the height of from one to two feet, and the flower is of a pale bluish purple. The term "*soiling*," made use of in this correspondence, may not be familiar to all our readers. It is applied to the feeding of cattle confined in narrow enclosures, not affording sufficient pasturage.—Editor.

From my own experience, as well as from the observations of others who have cultivated this grass, I am satisfied, that an acre of good *Lucerne* will feed six cows live months, from the 20th of 25th May to the 25th Oct. This, to a person located as I am, upon a small farm, where land is high would be worth \$45, or \$1 50 per month for each beast.

Lucerne is less affected by drought than any grass I am acquainted with; and but few grasses abide longer than it does in the soil. It does not attain its full strength until the third year, and its medium duration is ten or twelve years.

I will further remark, for the guidance of those who may undertake to cultivate *Lucerne*, and are unacquainted with its character and habits, that it requires a rich, deep, clean, light, and dry soil. It will neither do well upon clays nor wet grounds.

It should be sown only in the spring, when the ground has acquired warmth sufficient to promote a quick and vigorous growth.

It should be sown for soiling as soon as the blossoms appear; and be permitted to wilt a few hours in the *swath* before it is fed to neat cattle. And lastly, like all other crops.

It is benefitted by an occasional dressing of manure. I think the best way is to apply compost or short dung in autumn, and harrow with a light harrow in the spring.

When cut for hay, there is a difficulty in caring *Lucerne* without great loss, as the leaves dry and crumble before the stem is cured. It should be managed like clover—lay a few hours in *swath*, and then put into small slender cocks with a fork. It will cure in two good days. I mixed my autumn crop, in the barn, with alternate layers of straw. Your obedient servant.

J. BUEL.

ISAAC M. ELY, Esq.

CONSTANTINOPLE.

The climate of Constantinople, for the latitude is one of the coldest places in Europe, as the prevailing winds are north and south, blowing directly through the Bosphorus. A modern traveller has aptly compared a resident at Constantinople to a man in a thorough draft, or standing at the nozzle of a pair of bellows. Vegetation is scarcely a fortnight forwarder than in England, and flowers are agreeable in the middle of April. Although the neighborhood of this city exhibits as rich a verdure as could be seen in the first dairy countries in the world, yet butter can scarcely be procured, and the milk is not drinkable. The meat, from bad management, is likewise very inferior; lamb is not allowed to be killed till the end of May; pork, when in season, is excellent; and though the butcher pays an enormous sum for the privilege of selling it, the price does not exceed 3d. per pound; of fish, there is a great abundance, and of the most extraordinary colours and shapes, but in general very inferior to what is caught on our coasts—the shell-fish in particular, is almost without flavor.

Bologna Sausages.—All the world are aware that these sausages are esteemed the nicest, if not the most delicate food that can be eaten; yet they are made with ass's flesh. Xenophon, in his *Anabasis*, remarks that the flesh of the wild ass was esteemed a delicacy by the army; and in the history of Belisarius's wars, we find mention of sausages made from the flesh of asses that had died of the plague.—*London Weekly Review*.

From Loudon's (London) Gardener's Magazine.

On the mode of procuring a crop of cucumbers during winter, by forming the hot bed within a vinery.—The gardener that is most successful in growing early cucumbers, is generally considered clever in every other part of his business.—This is not altogether without reason, for the man who bestows the necessary attention to keeping up the proper degree of heat, giving and taking away air, covering and uncovering, &c., to a cucumber frame, during the winter months, is likely to be of regular habits and careful attention, and these qualities go far towards the ensuring success in whatever is taken in hand.

The duties of gardeners in small places near large towns, are generally very different from those of their brethren, in the country. In the former case, their attention is confined to a few objects, and of course greater excellence is attained; in the latter, the gardener has often the charge of extensive shrubberies, park scenery, and distant plantations;—and those necessarily take him away a great part of his time from the kitchen garden, and leave him dependent upon his assistants. It was the experience of the uncertain results connected with this dependence, which led me to the plan of placing my winter cucumber bed in a vinery, and to manage the vinery and bed in the manner I am now about to describe.

This vinery was forty feet long, sixteen feet broad, twelve feet high at the back, and five feet and a half high in the front, with one fire place, and a flue which passed round the house. The air could be admitted both by the top and front lights.

On or about the 20th of September, cucumber seeds were sown on a moderate hot-bed in the open air, and treated in the usual manner until they were ready to ridge out. This generally happened about the beginning of November, at which time the shoots of the vines were withdrawn from the house, and a dung bed formed in the floor in the usual way. After placing the frame and mould on the bed, it may be left without the lights till the rank steam has passed off.—After this the plants being placed in the hills, and the sashes put on, the following are the leading features of management during the winter:—

Make fires in the evening, so as to warm the air of the house to from 56° to 60°, and in very severe frosts it may be raised to 70°. In the mornings of the coldest weather, and shortest days, make a strong fire, so as to raise the heat to nearly 76°, when the house is shut up. About eight o'clock and from that time to half-past nine, give plenty of fresh air, by opening the front sashes and top lights, after which, and during the remainder of the day, give plenty of air to the cucumbers, by tilting the sashes in the usual way.

In mild weather and during sunshine the lights may be taken entirely off the cucumbers for some hours each day; and immediately after forming new linings, the top lights may be left down a little all night, to permit the escape of any rank steam.

The advantage of this mode of growing cucumbers during winter is the comparative certainty of an early and good crop, at one third of the trouble and expense of the common method out of doors. The expense is lessened by no covering up being required, and by all the labour attending renewal

of linings, &c. &c. admitting of being done in wet weather.

By this practice fruit may be cut in January.—The vines may be introduced in the beginning of March, and will break beautifully and regularly in consequence of the genial steam of the dung. In April the shade of the vine leaves will have rendered the house too dark for the culture of the cucumber, and, as by this time cucumbers are plentiful in the common hot beds out of doors, the bed in the house may be cleared out, and the vines treated in the usual way till the following November.

Yours, &c. J. REED.

On the Varieties of Cardoon, and the Methods of cultivating them. By Mr Andrew Matthews.

The cardoon is not very generally cultivated in English gardens, probably, as Mr Matthews conjectures, because "it requires more skill in the cooking than is commonly applied to it." It is a good deal in use in the South of France, as about Tours, where it is used in soups and stews, and sometimes in salads. The sorts described are the common, Spanish, Cardoon of Tours, and Red Cardoon. The Spanish, Mr Matthews considers the best, and the culture of any of the sorts he states to be particularly easy. Sow about the middle of April, in deep, light, not over rich soil, in trenches about six inches deep, by twelve inches wide, and four feet distant centre from centre. Drop three or four seeds together at intervals of eighteen inches, and, when they come up, thin them out to single plants. Water frequently during summer; and, in a dry day about the end of October, commence the operation of blanching, by tying up the leaves with twisted hay bands, after which earth may or may not be heaped round them in the manner of landing celery, according as they are to be used early or during winter.—The common practice is to tie slightly with matting in the beginning of October, and earth up once a fortnight, till the plants are sufficiently covered, in the manner of celery. The French mould up the bottom of the plant a little, then tie up the leaves with packthread, and stanch them with long clean straw, made fast with strong matting, or small ropes. The hay band method is the best.

Cardoons may be transplanted in the manner of celery, but they are found to do much better when sown where they are to remain. In France the flowers are gathered and dried in the shade, and used instead of rennet to coagulate milk.

Insalubrity of the neighborhood of dunghills.—A writer in a French agricultural journal points out, with great force, the injury done to the atmosphere, as far as respects the breathing of animals, by the decay of animal and vegetable matter in dunghills, ditches, ponds, wells, and especially in sewers, and the cess-pools of water-closets.—Wherever health is an object, he recommends neutralizing the mephitic exhalations which arise from these places, by daily strewing over them, from a dredgebox, powder of lime, of which a very small quantity is said to have the desired effect. Though there is nothing new in this, yet it affords important hints for those who are employed to arrange the detail of dwelling-houses, and out-of-door-offices; and also to those who live in confined situations.—*Gard. Mag.*

Colchicum.—In the British newspapers a case

was lately related, in which the bulbs having been eaten by a family, boiled along with potatoes, proved poisonous; and a French veterinary journal relates the case of twelve cows, which had been fed with the leaves and seed-vessels, and soon after showed the most alarming symptoms. By the use of strong decoctions of linseed, they were recovered after two or three days.—*Bul. Un.*

Mouldiness in the timber of a house, it is found, may be prevented by washing it over with a weak solution of muriate of mercury. The repair of a church at Potsdam, the timber of which, though quite new, was covered with mould, gave rise to the discovery.—*Bul. Un.*

Emigration to the Canadas.—Unquestionably, no man who is willing to make the slightest exertion can starve in America. If he will undertake to clear a farm, the means of subsistence are at once secured; should his habits unfit him for such an undertaking, the price of labour is so high, he is sure of lucrative employment in whatever capacity he chooses to enter the service of a master. So far the prospects of the emigrants are encouraging and agreeable.

But let us turn for a moment to the other side of the picture. Let us contemplate the exile seeking the portion allotted to him in the wilds of the forest, with the compass for his guide, doomed to endure, in his wretched log hut the rigours of a Canadian winter, without a human being for many miles round to break his solitude, or assist his labours. No village, no shop of any description, no medical advice within his reach, and worse than all, the lonely tenant of the woods is generally remote from any market, where he may dispose of the hard-earned fruits of his labours.

Personal Narrative of M. de Roos.

Australian Agricultural and Horticultural Society, August, 1826.—Premiums were offered for various agricultural productions, and for the best treatise on Australian agriculture; the best treatise on Australian gardening; a treatise on the best and most economical mode of preparing extract of bark from the mimosa, and other trees of the colony; on the best and most economical mode of preparing the potash of commerce from the woods of the colony; and on the best mode of preparing the castor oil from the seed of the Ricinus communis.

The Honorable Alexander M'Leay, F.R.S. &c. formerly Secretary to the Linnean Society of London, is the Vice-Patron of this Society, and, among its Committee, we observe the name of Robert Townson, L. L. D. the celebrated author of Travels in Hungary.—*Colonial Times.*

Australian Agricultural and Horticultural Society, February, 1827.—A report was read, by which it appears that the crop of wheat was above an average, and the crop of maize promised to be abundant, where it was sown in rich alluvial soil, but a failure on fresh land. Tobacco is said to be less extensively grown, since the reduction of the duty. The condition of the vineyards is mentioned as extremely luxuriant. The influence of the turf-club, in encouraging the breed of horses, forms a subject of congratulation, as also the increasing numbers, and the improvement in quality, of the breeds of horned cattle. An improvement of the quality of wool produced from sheep of the Saxon breed is also noticed.—*Col. Times.*

TRAPS FOR HAY-STEALERS.

Have the grower's name printed or written on a great number of little slips of paper, distribute these in the hayrick as it is building, so as there may be at least one slip to each truss, which will not require above one hundred slips to an acre, but to make quite sure, say two hundred. Then when you suspect your man has given away a truss, or any particular truss or quantity to be stolen from your cart or rick, have the truss pulled to pieces, &c. This practice has been adopted in Shropshire, and a thief detected and convicted in consequence. The ingenious inventor is Mrs Richards, of the parish of Clun.

LACKAWANA COAL MINES.

These Mines, with a body of land attached thereto, we are told, sold for *one hundred and forty thousand dollars!* One hundred thousand of which were paid by Stock of the Hudson and Delaware Canal—and forty thousand in cash.

Carbondale is the name given to the Coal Mines, formerly belonging to *Maurice and Wm. Wurtz*, Esqs. now owned by the Delaware Hudson Canal Company. It is situated on the Lackawana river, Blakely township, Luzerne county, 32 miles from Wilkesbarre, 8 miles from Dundaff, the late seat of the Northern Bank of Pennsylvania, and 16 miles from the Dysburry Fork of the Lackawaxen, to which place a turnpike road is now completed, and a rail road in contemplation. At this place, the canal up the Lackawaxen will terminate for the present. The Mines are handsomely opened, the coal appears to be of an excellent quality, and about five and twenty operatives are employed in uncovering and raising this valuable article; and in erecting Saw Mills, and other improvements, about the same number of workmen are employed. The Delaware & Hudson Canal Co. have issued bills in the nature of bank bills—which have a currency superior to that of the Northern Bank in its best days and we are pleased to say that the operations of the Coal Mines, and on the canal now constructing on the Lackawaxen, afford a market for the surplus produce of the agriculturists in the counties of Luzerne and Susquehanna; and assure the landlord and the cultivator, that the land and its products will rise its value.—

Village Record.

Every family to make their own sweet oil.—This may easily be done by grinding or beating the seeds of the white poppy into a paste, then boil it in water, and skim off the oil as it rises; one bushel of seed weighs fifty pounds, and produces two gallons of oil. Of the oil sold as sweet olive oil, one half is oil of poppies. The poppies will grow in any garden—it is the large headed white poppy, sold by apothecaries. Large fields are sown with poppies in France and Flanders, for the purpose of expressing oil from their seed.—(Wide 10th and 11th vols. of Bath Society Papers, where a premium of twelve guineas is offered for the greatest number of acres sown in 1808 and 1809.) When the seeds are taken out, the poppy head, when dried is boiled to an extract, which is sold at two shillings sterling per ounce, and is to be preferred to opium. Large fortunes may be acquired by the cultivation of poppies.—*English Receipt Book.*

To preserve oranges, lemons, and other fruit.—Take small sand and make it perfectly dry; after it is cold put a quantity of it into a close clean

vessel; then take your oranges, and set a laying of them in the same, the stalk end downwards, so that they do not touch each other, and strew in some of the sand, as much as will cover them two inches deep; then set your vessel in a cold place, and you will find your fruit in high preservation at the end of several months.

Tricks of Fruiterers.—In many of the London fruit shops, yellow grapes have their bloom restored by being fumigated with sulphur; and some fruiterers of little repute are in the habit of supplying a bloom to plums, by dusting them with the powder of the common blue used by laundresses. The last operation is, in general, so clumsily performed, that it may be easily detected.

Storch, in his Description of St Petersburg, mentions some of the tricks that are performed on culinary vegetables and fruits in that city, but they are in general too gross, and involve too much manipulation, for being practised in Britain. For example, after asparagus has been used at the tables of the great, the returned ends of the shoots are sold by the cook to itinerating green grocers, who carve a new terminating bud, colour it, and add a bloom, in imitation of nature, make up the ends so prepared in bundles, with a few fresh stalks outside, and sell the whole as genuine asparagus.

CURE FOR A COLD.

The following receipt to cure a cold is said to be so efficacious, that we republish it at the request of a correspondent who has tested its virtues.—*Am. Farmer.*

Take a large tea spoon full of flax-seed, with two penny worth of atic liquorice, and a quarter of a pound of sun raisins. Put it into two quarters of soft water, and let it simmer over a slow fire, till it is reduced to one; then add to it a quarter of a pound of brown sugar evenly, pounded, a table spoon full of white wine vinegar, or lemon juice. Note—The vinegar is best to be added only to that quantity you are going immediately to take; for if it be put into the whole, it is liable in a little time to grow flat. Drink a half pint at going to bed, and take a little when the cough is troublesome. This receipt generally cures the worst of colds in two or three days, and if taken in time, may be said to be almost an infallible remedy. It is a sovereign balsamic cordial for the lungs, without the opening qualities, which engender fresh colds on going out. It has been known to cure colds, that have almost been settled into consumptions, in less than three weeks.

Salubrity of the London air.—It was a saying of Mr. Cline, many years ago, that, "London was the healthiest place in the world." In no place are there so many human beings congregated together enjoying so high a degree of general good health. It has been stated, and we believe, correctly, that the happy exemption, which the inhabitants of London, for the most part, enjoy, from the diseases common to other capitals, is owing to the sulphurous naphtha emitted from the coal, serving the salutary purpose of checking the progress of febrile affection. To prove that the air is saturated with the naphtha, we shall not be able to recognize the presence of a wasp, an insect to which sulphur is obnoxious, within the sphere of its action.

Chinese mode of fattening fish.—The Chinese are celebrated for their commercial acumen, in defatigable industry—and natural address in making the most of every gift of nature bestowed on their fertile country. Useful as well as ornamental vegetables engross their care; and animal, which are the most profitably reared, and which yield the greatest quantity of rich and savoury food, are preferred by them for supplying their larders and stews. When a pond is constructed and filled with water, the owner goes to market and buys as many young sturgeon fish as his pond can conveniently hold; this he can easily do, as almost all their fish are brought to market alive. Placed in the stews, they are regularly fed morning and evening, or as often as the feeder finds it necessary; their food is chiefly boiled rice—to which is added the blood of any animals they may kill, wash from their stewing pots and dishes, &c. indeed,—any animal offal or vegetable matter which the fish will eat. It is said, they also use some oleaceous medicament in the food, to make the fish more voracious, in order to accelerate their fattening. Fish so fed and treated, advance in size rapidly, though not to any great weight, as the perch never arrive at much more than a pound *avoirdupois*; but from the length of three or four inches, when first put in, they grow to eight or nine in a few months, and are then marketable. Drafts from the pond are then occasionally made; the largest are first taken off, and conveyed in large shallow tubs of water to market; if sold, well; if not, they are brought back, and replaced in the stew, until they can be disposed of.

PROFITABLE DAIRYING.

The following proceeds from twenty five Cows, the last season, we have from the owner, Mr Johnathan Dyer, of Charenton. Such enterprise is worthy of imitation.

6017 lbs. Cheese worth 6½ cents	375 10
450 lbs. " " 4	18 00
1900 lbs. Butter, " 12½	127 50
Proceeds from the sale of Calves.	50 00

\$580 00

Mr Dyer further assures us that the whey and butter-milk amply paid for making and all continuing expenses. The cows had no extra keeping but were doubtless well attended to.

Antidote against poison.—A correspondent of the London Literary Gazette, alludes to the numerous cases of death from accidental poisonings, and particularly to the melancholy fate of the Royal Academician, Mr. Owen, adds, "I may venture to affirm, there is scarce even a cottage in this country that does not contain an invaluable, certain and immediate remedy for such events, which is nothing more than a desert spoonful of mustard, mixed in a tumbler or glass of warm water, and drank immediately;—it acts as an instantaneous emetic; is always ready, and, is used in safety in any case where one is required. By a mistake, where a gentleman took a full ounce of poison instead of salts, the castors were fortunately at hand, and no doubt an invaluable life was preserved to his family by giving the mustard directly. By making this simple antidote known, you may be the means of saving many a fellow being from an untimely end."

NEW ENGLAND FARMER.

BOSTON, FRIDAY, DEC. 28, 1827.

☞ We are obliged to defer till next week, F. U. P. and some other articles.

FARMERS' ACCOUNTS.

Every farmer who desires to know correctly to what profit he does business, should provide himself with a book, which he may call his *General Stock Book*—and in this book, some time in December, he should register the result of a general survey of the condition and worth of his whole stock and property—of his debts and credits.—Having such a book to refer to at all times, and on all occasions, will afford much satisfaction to his mind. In the first place, he should order in all tradesmen's bills, and in the mean time he may take an examination and account of all his household goods, horses, cattle, poultry, corn, grain, in straw or threshed, hay or other fodder, wood, manure, wagons, carts, ploughs, and implements of all kinds—the state of his fences, gates, drains, &c.; and make an estimate of the necessary repairs. Minutes being made on waste paper, the particulars may be afterwards entered into the Stock Book with such a degree of minuteness as may be judged necessary. After this general register, a Dr. and Cr. account may be drawn out, the balance of which will exactly show the present worth of his estate. The form of the account may be as follows:—

*Stock Dr.**Contra Cr.*

On the Dr. side should be entered all the farmer owes, and on the Cr. side all he possesses, and all that is owing to him. He must rate every thing at what he judges to be the fair present worth, (was it then sold); manure and tillage performed must be valued at the common rate of the country.

If a farmer wishes to be very correct in his calculations of the profit and loss, upon a lot of stalled oxen, for instance, on the crop of any particular field, his readiest method is to make an account for either one or the other in his ledger of Dr. and Cr. On the Dr. side let him place the cost, including every minute particular, and on the Cr. side the returns. On the sale of the articles, the account is closed, and the balance demonstrates the profit and cost.

PARSLEY. (*Apium petroselinum*.)

This well known garden-plant, is, in England, a subject of field cultivation. It is a native of Sicily, but will endure the winter of our climate. Mr. Loudon says, "Parsley is sown along with clover and grass seeds in some places, and especially in Lincolnshire, as a preventive of the rot in sheep." A writer for the Farmer's Magazine, (Scotland,) says, "a friend of mine having occasion to observe the partiality of black cattle for the common garden parsley, and their preference of it, when growing, to almost any other green food, took it in his head to try how it would succeed in a field that he was going to sow down for pasture. He accordingly sowed two or three ridges with parsley seed, and the rest of the field with clover and ryegrass. As soon as the field was ready for pasture he led his cattle into it, and it was perfectly evident that they preferred the part which was sown with the parsley, to any other part of the field, inasmuch that they never touched the rest, while there was a single blade of parsley to be had. Horses were equally fond of it,

and that too, without vanity; as it reflects far more credit on the artist than on myself. To such a recommendation, moreover, I feel the greater confidence, both because I was requested to publish it by many of the first agriculturists in the kingdom; and since published, it has met with their highest approbation. This print consists of a groupe of five animals, so arranged as to show the just proportion and proper symmetry of every essential part. The portraits were taken from the most perfect animals in my possession; and the engraving, which is in a style far superior to that in which cattle are generally executed, was finished with the greatest care. And, if I am correct in my description for the proper formation of cattle, and the portraits in the above mentioned print be also good, I think he who carefully compares the portraits with the description itself, cannot long fail of being at least a very tolerable judge. For any one reading the description of a particular part, for example, of the breast; he will there find, that it ought to be wide, and to project well before the legs; and on turning to the print he will immediately see this projection shewn in the side-view of the bull, and the width in the heifer, which faces him; and so on with respect to every other part. For as each animal is placed in a different position from the rest, there is no important point which is not fully presented to the view."

"This vegetable is eaten with great avidity by sheep, and it not only renders their flesh more delicious, but is also believed to preserve them against the rot. Instances have occurred, where sheep fed in parsley remained sound, while those in the vicinity of the farm were uniformly subject to that disease. Mr. Mills, therefore, recommends these animals to be fed with it, twice in the week for two or three hours at each time.—It may likewise be beneficially given to sheep affected with the scab or red-water, and is said to be very efficacious in recovering surfeited horses, or such as are subject to the grease."

Another English writer says that parsley should be sown among oats and fed the following year with sheep. Two bushels of seed to the acre is the quantity recommended when no other grass seed is sown; but, probably, the management would be to sow it with clover or some other succulent grass.

London says that parsley "is sown along with clover and grass seeds in some places, and especially in Lincolnshire, as a preventive of the rot in sheep, &c. In laying down lands to grass, Hoyte in the fourth volume of *Communications to the Board of Agriculture*, advises the sowing with twelve pounds of white clover, two pounds of red clover, two pecks of ryegrass, and two pounds of parsley to the acre; as the parsley stands two years, and by its diuretic qualities, prevents the sheep from dying of the red-water, which too luxuriant clovers are apt to produce. The seed requires a longer time to germinate than any other agricultural plant, and might probably be advantageously prepared by steeping."

ELEGANT PRINT OF CATTLE.

In the *New England Farmer*, [vol. i.] we published a pamphlet, entitled, "*Remarks on the Improvement of Cattle, &c. In a Letter to Sir John Saunders Sebright, Bart. M. P. by Mr. John Wilkinson, of Lenton, near Nottingham.*" In the work, the following passage occurs, (See page 252). "Should any difficulty still remain in forming a clear conception of the points described. I think in such a case, I may very safely recommend a print, which I published a short time ago,

and that too, without vanity; as it reflects far more credit on the artist than on myself. To such a recommendation, moreover, I feel the greater confidence, both because I was requested to publish it by many of the first agriculturists in the kingdom; and since published, it has met with their highest approbation. This print consists of a groupe of five animals, so arranged as to show the just proportion and proper symmetry of every essential part. The portraits were taken from the most perfect animals in my possession; and the engraving, which is in a style far superior to that in which cattle are generally executed, was finished with the greatest care. And, if I am correct in my description for the proper formation of cattle, and the portraits in the above mentioned print be also good, I think he who carefully compares the portraits with the description itself, cannot long fail of being at least a very tolerable judge. For any one reading the description of a particular part, for example, of the breast; he will there find, that it ought to be wide, and to project well before the legs; and on turning to the print he will immediately see this projection shewn in the side-view of the bull, and the width in the heifer, which faces him; and so on with respect to every other part. For as each animal is placed in a different position from the rest, there is no important point which is not fully presented to the view."

A gentleman, who is friendly to our Establishment, and a well wisher to the great interests to which our paper is devoted, has presented us a copy of the Print above described, which we have placed in the *New England Farmer* office, for the inspection of any person who will take the trouble to call and look at it.

To preserve eggs sound for the space of two years.

For the following process for keeping eggs perfectly sound, a patent was granted to Mr. Jayne, of Sheffield, in England. Put into a tub or vessel, one bushel, Winchester measure of quick lime—thirty-two ounces of salt, eight ounces of cream of tartar, and mix the same together, with as much water as will reduce the composition or mixture, to that consistence, that it will cause an egg put into it to swim with its top just above the liquid; then put and keep the eggs therein, which will preserve them perfectly sound for the space of two years at the least. This method is not the worse for being simple, and the still simpler one of merely keeping eggs in salt, is known by many good housewives to preserve eggs quite sound for a considerable time.

It has been calculated that the manufacture of wool, (including the various mechanics and laborers employed,) in the New England States sustains about 20,600 families, or 120,000 persons—and that these will consume the surplus products of 40,000 families of agriculturalists;—together, about 300,000 individuals.

Bite of the Rattle-snake.—An article has been published in several journals, giving the account of a remarkable cure of the bite of a rattle-snake, by cupping with a common porter or black bottle. The plan resorted to was, to fill the bottle half full of spirit of turpentine, made quite warm, and after scarifying the wound made by the snake, to apply the mouth of the bottle to it, and then pour cold water on the bottle till perfectly cooled. It is said, in the case above alluded to, that the patient was in the most excruciating agony, previous

to the bottle being applied, but soon became easy, and fell into a sound sleep. The next day he was able to walk about and work as usual. Spirituous liquors of any kind, or even warm water, will do very well, as a substitute for spirits of turpentine.

The writer of this article thinks any kind of spirit would do as well as spirits of turpentine.—This we apprehend may be a great mistake. The latter spirit is exceedingly active and penetrating, and it may be, if the above statement is true, that the turpentine, which seems to have been applied to the wound, prevented the too frequent effect of the bite of the rattle-snake. It might have destroyed this animal poison by chemically decomposing it. We throw out this idea in the hope that those who may have an opportunity of observing the effect of the turpentine in accidents of this kind, may decide whether it has any preventive or counteracting effect in these cases, or not. We have seen many punctured wounds of the feet, to which the spirit of turpentine was applied. The orifice of the puncture was enlarged. No accident followed in a single instance. Whether the turpentine acted as a preventive in any, or all of these instances, it is impossible to say; that it did so, in some of these cases, considering that several of the punctures were deep and painful at first, and made by rusty nails, is only presumptive evidence, more or less probable. The turpentine is coming into frequent and good use, as a remedial substance, both externally and internally, and is well worth a trial in punctured wounds, and in the bite of insects and poisonous reptiles, when something better known and more to be relied on, is not at hand.—*Medical Intell.*

To prevent shoes from taking in water.—It is stated in the Family Receipt Book, that one pint of drying oil, two ounces of yellow wax, two ounces of turpentine, and half an ounce of Burgundy pitch—melted carefully over a slow fire. If new boots or shoes are rubbed with this mixture, either in the sun-shine or at some distance from the fire with a sponge or soft brush, and the operation is repeated as often as they become dry, till the leather is fully saturated, they will be impervious to wet, and wear much longer, as well as acquire a softness and pliability, that will prevent the leather from ever shrivelling.

NOTE. Shoes or boots prepared as above, ought not to be worn till perfectly dry and elastic, other wise their durability would rather be prevented than increased.

Rail-roads.—After all our boasting, if we do not take care, the people of the south, will have the first rail-road—at least the following, from the Southern Patriot, seems to indicate as such:

A bill to incorporate a company to construct a rail-road, between the city of Charleston and the towns of Hamburg, Columbia, and Camden, has been introduced into the House of Representatives, by Alex. Black, of Charleston, which has had the first reading to-day, and ordered for a second reading to-morrow.

Varnish for Wood.—The Italian cabinet work in this respect, excels that of any other country. To produce this effect, the workmen first saturate the surface with olive oil, and then apply a solution of gum arabic in boiling alcohol. This mode of varnishing is equally brilliant, if not superior to that employed by the French in their most elaborate works.—*Blackwood's Mag.*

Feeding Geese.—It is said that geese may be advantageously fed on turnips, cut in small pieces similar to dice, but not so large, and put into a trough of water.

To make good Cider Cake.—Two pounds of flour, one of sugar, half of butter, one of fruit, one pint of cider, two teaspoons of pearlash, cloves and spice to your taste.

The Bristol Tunnel.—We understand that this undertaking is proceeding rapidly, and that the Tunnel is completely finished for the space of a quarter of a mile. The excavators are employed day and night, and every effort appears to be making to complete the work with all possible celerity.

In the New York Court of Sessions a few days since, William Brackett was tried for *beating a drum*; but it was a *Mrs. Drum*, who had previously beat the prisoner, and whose head "discouraged music," that did not please the court.

The Coffee Bean. "It is generally said, loses its vitality in a few weeks. Some years ago, when I resided in Italy, my children used to sow the beans which we had in daily use, and they grew freely. I suppose they were imported to Leghorn from Africa, but how old they might be I am not able to say. When I mentioned this to a gentleman curious in botanical matters, he told me he had raised date and cocoa palms from nuts bought in the London shops, but had never tried the Coffee. I should like to know the experience of others on the subject."—*C. H. D. March.* Since the above was in type, we have seen a young Coffee plant raised from one of a handful of seed, taken indiscriminately from a parcel of Mocha Coffee purchased in the shops.—*Cont.*

Sleep Scalers.—The Perry (Pa.) Forrester says that several hundred sheep have been killed by dogs in the vicinity of that place within two or three weeks. The shepherds on Salisbury plain, and on the Dorset and Sussex downs in England, where vast flocks of sheep are kept, resort to a method for the discovery of dogs who have acquired habits of worrying their flocks, (a habit by the bye which like most other bad habits is seldom forsaken) as easy and as simple as it is certain. When they find that a sheep has been worried or killed in the night, they go round to all the farms and cottages in the neighborhood, and examine well the mouth of every dog they can find; and the guilty ear is detected by the wool of the sheep; particles of which will lodge between, and adhere to the teeth for several days. It is almost needless to add that in such cases the shepherd assumes at once the office of Judge, jury, and executioner. "Out of thine own mouth will I condemn thee, thou rascally hound," forms the sum and substance of indictment, pleadings, and sentence—and execution inevitably follows.

Rats.—A correspondent sends us an article from the Albany Argus, recommending "ground cork, fried in grease, as an efficacious plan for destroying rats." Several years ago, we tried a similar experiment, but upon the return of a dog day we began to have serious thoughts of establishing a board of health in one corner of our office.—*Bellevue Falls Int.*

Mr Benjamin Fowler, in Pembroke, this year raised an English turnip, which when dressed of its top weighed 21 pounds, and measured in girth three feet seven inches.

Cobbett's Agricultural Works.
Just received for sale at the office of the New England Farmer, A Ride of eight hundred miles in France, containing a sketch of the face of the Country, its Rural Economy, of the Towns and Villages, of Manufactures and Trade, and Manners and Customs—Also, an Account of the Prices of Land, House, Fuel, Food, Raiment, and other things, in different parts of the Country. By James Paul Cobbett, (son of William Cobbett.) London edition, price 7s 6c.
Also, a further supply of the American Gardener; or a treatise on the Situation, Soil, Fencing and Laying out of Gardens; on the making and manuring of Hot beds and Green Houses; and on the Propagation and Cultivation of the several sorts of *Vegetables, Herbs, Fruits and Flowers.* By William Cobbett.—London edition, with several engravings, price \$1.00. [C] This

is probably one of the best Treatises on Gardening extant, (excepting, perhaps, the more elaborate work of M'Mahon.) The directions in the American Gardener for the management of Grape Vines and Peach Trees are pronounced by experienced and competent Judges, to be the best of any extant, and well worth, alone, the price of the book.—It has, likewise, very fit, directions for the management of Garden Vegetables and Ornamental Flowers.

Cottage Economy, containing information relative to the making of Bread, brewing of Beer, keeping of Cows, Pigs, Bees, Hives, Goats, Poultry, and Rabbits, &c. with instructions relative to the cutting, and the bleaching of the Plants of English Grass and Grain, for the purpose of making *Plots and Bonnets*—Price 62 cts.

New England Farmer's Almanack, for 1823.
Just published at the New England Farmer Office, and for sale by BOWLES & DEARBORN, 72 Washington Street, and at the Bookstores generally, the *New England Farmer's Almanack*, for 1823. By Thomas G. Fessenden, Editor of the New England Farmer.

Bremen Geese.
FOR sale, 10 pair superior BREMEN GEESSE. Apply to THOMAS WILLIAMS, Noddle's Island, to Mr RUSSELL, at the New England Farmer office. Dec 7.

Lucerne Seed.
A few hundred pounds of fresh Lucerne seed, by the pound or hundred weight, for sale at the N. E. Farmer office.

White Mustard Seed.
For sale at the office of the New England Farmer, the best English White Mustard seed, by the pound or bush.

WINTER.

Time swiftly flies—in bold career,
Still circling on from year to year,
No pause he makes—o'er town or tower,
By night's still couch—at mid day's hour—
Still on he sweeps; each matin chime
Gives warning of the flight of Time.

Put yesterday—each eye hath seen
Nature in youth and beauty green;
The cowslip raised its daisy head—
The wild rose graced its wilder bed—
The laurel bloom and scented thyme,
Combined to form a wreath for Time.

Put He hath dashed them from his brow,
And Winter's treasures deck him now—
His locks display the snowy gem,
Diamonds of hail his shaggy mane,
And Winter, from his frozen clime,
Follows the waning flight of Time.

WISE SAYINGS OF POPE.

1. Fine sense and exalted sense are not half so useful as common sense. There are forty men of wit to one man of sense; and he that will carry nothing about him but gold, will be every day at a loss for want of ready change.

2. A man should never be ashamed to own he has been in the wrong; which is but saying, in other words, that he is wiser to-day than he was yesterday.

3. To be angry is to revenge the fault of others upon ourselves.

4. To relieve the oppressed is the most glorious act a man is capable of; it is in some measure doing the business of God and Providence.

5. When we are young, we are slavishly employed in procuring something whereby we may live comfortably when we grow old; and when we are old we perceive it is too late to live as we proposed.

6. The world is a thing we must of necessity, either laugh at or be angry with; if we laugh with it, they say we are proud; if we are angry at it, they say we are ill-natured.

A quaker gentleman covered with his beaver, was once in company with a lady rather too much uncovered, who drank to his "broad bottomed beaver." The quaker having thanked her for the honor she did him, observed, filling up a bumper, "in return for thy civility, Maria, I drink 'by absent han' therelief!'"

An Irish paper gives the following anecdote of the simplicity of a raw *Pat*, who had just been transplanted from the interior to Dublin:—

Pat had been sent by his master to purchase half a bushel of oysters, to the quay—but was absent so long, that apprehensions were entertained for his safety. He returned at last, however, puffing under his load in the most martial style. "Where the deuce have you been?" exclaimed his master. "Where have I been? why where would I be but to fetch the oysters?"—"And what is the name of St. Patrick kept you so long?"—"Long! by my *soul*! I think I've been pretty quick, considering all things."—"Considering what things?"—"Why, considering the gutting of the fish, to be sure."—"Gutting what fish?"—"What fish? why, blind-an-ovns, the

oysters to be sure!"—"What do you mean?"—"What do I *mean*? why, I mean, that as I was a resting myself down forenent the Pickled Herring, and having a drop to comfort me, a *gentle man* axed me, what I'd got in the sack? *Oysters*, says I—"Let's look at them," says he; and he opens the bag. '*Ock! thunder and praties*, who *sould* you these?' It was Mick Carney says I, aboard the *Powl Doodle* smack. '*Mick Carney*, the thief o' the world! what a blackguard! he must be to give them to you without *gutting*.' And ar'n't they gutted? says I. '*Devil o' one o' them*.' Masha, then, says I, what will I do? '*Do*,' says he, '*I'd sooner do it for you myself than have you abused!*' And so he takes them in doors and guts 'em *nate and clane*, as you'll see." Opening at the same time, his bag of oyster shells, which were as empty as the head that bore them to the house. If we had not this from an Irish paper, we should venture to doubt its authenticity.

Lord Kelly had a remarkable red face. One day Foote solicited him to look over his garden wall to ripen his melons.

How to pose a Professor.—"I say, Mr Cripps, understand you're a great *bottomist*."—"Bottomist, Sir! I don't understand what you mean." Not know what I mean! why, they tell me you knows all about things that grow at the bottom of the sea, and such like, you know." "Oh! a *botanist*, you mean; well I do profess to be a bit of a *hot-an-ist*." "Well then, can you tell what this is?" "Why sir, that is what is called—"*I* don't want to know what it's called—"*I* want to know what it *is*."—"Well, sir, then it is a portion of the marine plant *conferva*."—"Then give me leave to tell you, Mr Cripps, it is no such thing; it is neither more nor less than a piece of *sea-weed*, for I plucked it up *myself*, on the sands yonder, not many minutes ago!" What more could he say? Mr Cripps turned upon his heel with a "*pshee!*" and the querist went home to breakfast, and boasted how cleverly he had posed a professor. "I know I should *pose* him!" said he; "and I did it on purpose; for I like to take the shine out of these *er professors*, as they call themselves!" He should have added, "Yet nature might have made me even as one of these, therefore I will not disdain."
A Scene at Margate.

Ancient and Modern Maxims.—"If there is any time when a man has a right to value himself, it is when he has done a good action in a proper manner.

The firmest friendships, are those formed in mutual adversity; as iron becomes more compact in the forge, when the flame is most vivid.

Governors need no arms where there are laws, and they heed no laws where there are arms.

The subtlety of pride covers itself with the mantle of humility; so high is this virtue, that even the most haughty wish to rise in her name.

The liberty of a people consists in being governed by laws made by themselves, under whatever form of government they may be.

The liberty of an individual consists in being owner of his own time and actions, so long as they are not in opposition to the laws of God, or of his country.

An action by which we gain an enemy and lose a friend, is a losing game; because vengeance is a much stronger principle than gratitude.

He who does nothing charitable while living, and leaves his property to the poor when dead, is merciful to *himself* too late.

Death has generally been called the debt of nature. A modern writer styles it a debt on demand. Sometimes it is a debt at sight.—Nature may be supposed to draw upon every individual son and daughter of Adam, in nearly the following terms:—Three-score years and ten, after birth pay this my first bill of exchange, to that grim and inexorable tyrant, Death, with or without further advice.

Garden, Field, and Flower Seeds.

We have now for sale, at the office of the New England Farmer, No. 52 North Market Street, Boston, the largest variety of Seeds to be found in New England,—mostly of the crops of 1827. The greatest care has been taken to have them raised by our most experienced seed-growers, and to have the sown perfectly genuine. The following comprises our most prominent kinds

<i>Artichokes</i> , Green Globe	<i>Cumbers</i> , 18 varieties, including White and Green Turkey, &c.
<i>Asparagus</i> , Devonshire Gravesend	<i>Egg Plant</i> , Purple and White
<i>Battersea</i>	<i>Endive</i> , Green & White curled
<i>Large White Reading</i>	<i>Patavina</i> , for winter
<i>Beans</i> , 26 varieties, including the English broad beans, dwarf and pole.	<i>Garden Burnet</i>
<i>Bats</i> , true Long Blood	<i>Italian Cress</i> , (several varieties)
<i>Early Blood Turnip</i>	<i>Kale</i> , Sea
<i>Early White Scurry</i>	<i>Purple curled</i>
<i>Yellow turnip rooted</i>	<i>Green curly Scotch</i>
<i>Broccoli</i>	<i>Leaf-London</i>
<i>Brocoli</i> , Early White	<i>Large Scotch</i>
<i>Early Purple</i>	<i>Lettuce</i> , 14 varieties
<i>Large Cape</i>	<i>Melon</i> , 11 varieties
<i>Cabbages</i> , 22 varieties, including the Russian, and common kinds, early and late.	<i>Mustard</i> , White and Brown
<i>Cardoon</i>	<i>Salsification</i>
<i>Carrots</i> , Altringham	<i>Okra</i>
<i>Long Orange</i>	<i>Onion</i> , 8 varieties, including the imported Madeira, Potatoe and Tree Onion
<i>Early Horn</i>	<i>Parsley</i> , 4 varieties
<i>Blood Red</i> (for West India market)	<i>Parsnip</i> , Large Dutch swelling
<i>Lemon</i>	<i>Peas</i> , 16 varieties
<i>Purple</i> (fine sort)	<i>Peppers</i> , 5 varieties
<i>Cauliflower</i> , Early and Late	<i>Pumpkins</i> , Finest Family
<i>Celery</i> , White solid	<i>Connoisseur Field</i>
<i>Rose-coloured solid</i>	<i>Mammoth</i>
<i>Italian</i>	<i>Radish</i> , 5 varieties
<i>Cherise</i> , or turnip rooted	<i>Rhubarb</i> , for arts, &c.
<i>Cherrie</i>	<i>Salsify</i> , or vegetable oyster
<i>Chicory</i>	<i>Salsify</i>
<i>Corn Stalk</i> , or Yettlost	<i>Sparzaccara</i>
<i>Cress</i> , Curled or Peppergrass	<i>Spinach</i> , 5 varieties
<i>Broad leaved</i> or Garden	<i>Squash</i> , 7 varieties
<i>Water</i>	<i>Tomatoes</i>
	<i>Turneps</i> , 15 varieties

Likewise, ESSENTIAL ROOTS and PLANTS, FIELD and GRASS SEEDS, POT and SUGAR BEET SEEDS, MONSIEUR HERB SEEDS, IRON SEEDS, and more than 200 different kinds of ORNAMENTAL FLOWER SEEDS.

As the variety and quantity of Seeds kept at this Establishment are by far greater than at any other place in New England, orders for the British Provinces, the West India market, or the Southern States, can always be executed with promptness, at satisfactory prices. Dealers in Seeds and Country Traders supplied, at wholesale or retail, on the best terms.

We have now on hand, of this year's growth,
200 lbs. Mangel Wurtzel & Sugar Beet, raised by J. Prince, Esq.
100 lbs. Onion Seed, Red, White and Yellow.
170 lbs. true Blood Beet, raised in Roxbury
180 lbs. Carrot, various kinds
180 lbs. Radish, superior quality
100 lbs. English Turnip, raised in Roxbury
70 bushels Peas, early and late.—[We have about 50 bushels of the Early Washington Pea, which was pronounced by the few who could obtain it last year—as our supply was small—the earliest and most productive of any brought into the Boston market.]

Among the new vegetable seeds we have this season, and which are not common in the Boston market, are the Early Russia Cucumber, [very early] Cambridge Lettuce, Grass Pea (for water use) Purple Parsley, Grand Asparagus, Lina and Valparaiso Spinach, Silurian Parsley, Early Russian Cabbage, Yellow Melon Turnip, Governor's Finest Family Pumpkin, Lady's Finger Pea (a new and fine marrowfat) and New Zealand Spinach.

Catalogues of the whole Establishment, with directions for cultivating the more rare and delicate sorts, comprising a pamphlet of 40 pages, furnished gratis.

THE FARMER is published every Friday, at \$3.00 per annum, or \$2.50 if paid in advance. Gentlemen who procure free responsible subscribers, are entitled to a sixth volume gratis.

No. 24.

AGRICULTURE.

From Cobbett's Ride in France.

VINES IN FRANCE.

The neighbourhood of Tours is a great place for vines, and for the making of fine wine. I went along with my landlord to-day to see his vineyard, which is at about half a league from the city.—The vintage of the black grapes is not quite finished, here, and that of the white grapes is begun. In this part of France they let the white grapes hang as long as possible, before they gather them, because, they say, it makes the wine stronger and of better flavour. The snow is, they tell me, sometimes upon the ground before the grapes are gathered. I saw a great many acres of vineyard to day. The vines look beautiful at this time, with all their leaves off, and loads of ripe grapes hanging upon them. The vines, which are planted in cuttings, or slips (just as *gooseberries* and *currants* are) of the last year's wood, begin to bear when about four or five years old.—An acre of vineyard, of the best sort of vines, is full bearing is worth, at Tours, about 3000 francs, or 125l. of our money. This year, they say, the vines will yield from 10 to 12 barrels of wine to the acre; barrels of 250 bottles each: or, as was before observed, of about 80 English wine gallons each. Good wine may be bought in Tours, by the single bottle, for 10 sous, or 1d. English, the bottle. The barrel, or *piece*, of this year's wine, will bring from 50 to 60 francs, at this place.—But the wine of this year will not be of the best quality, on account of the grapes not having ripened quickly, which they should do to make very good wine. Some of the vines are very old; some of them forty, some fifty years old. The land round Tours is hilly; uncommonly good strong land, and stoney, which is just the character of land to suit the vine. There is much rock in the hills here, as at Loches; and the wine-makers have caves, hewed out of the rocks, under the brows of the hills, in which to deposit the wine, and to carry on the process of making it. Some of the vines in this part of the country are cultivated in the *espalier* fashion. This is not, however, generally the case, where there is any considerable quantity of vineyard together. The common way is, to stick one stake, about four feet high, up to each vine. The stakes are pulled up, at this time of the year, when no longer wanted, and placed away in a *stack*, just as hop poles are in England. The stakes are, as I said before, made of coppice-wood, hazel, ash, and other kinds. They do not last above a couple of years: for, if used longer, they become rotten, and are easily broken by the wind. I was, when at Chateauroux, informed, that, further to the South, the cultivators of the vine make use of stakes of *Locust*, which, they say, grow in coppices, and last a great number of years. The *Locust* is, in France, generally called *Robinia*; but in the vineyards the stakes of it are called, *bois de fer*; or, *iron-wood*; a name which the *Locust* very well deserves.

There is a kind of grape, which I saw on some vines here, made use of to give a colour to the red wine. When this grape is squeezed, the

juice is of a fine dark colour, a mixture of purple and red. It is made use of in giving a colour to all red wine, which could not have the fine colour that we see in it, but for the use of this sort of grape. The vintage of the white grapes begins, this year, at about this time, the 7th of November.

From the American Farmer.

New and economical preparation of tar as a covering for houses.

MR. SKINNER, Sir,—The recent scarcity,—and consequent high price of tar, induces me to appeal to an experiment, the result of which I submit to your judgment either to communicate to the various readers of your useful paper, or otherwise dispose of it as you may think proper.—Finding it a difficult matter to mix tar and red ochre, suitable for the roofs of my houses, &c. I could not make a mixture of those two articles, that would not, when cool, become separate. I was induced to make the application of a third ingredient, viz: very strong brine, which has not only removed the difficulty complained of above, but has enabled me to effect the object with six barrels of tar, which nine, in the ordinary way of applying it to the roofs of houses, would not effect, in the following manner. In the kettle in which I warmed (not boiled) the tar, I put half a barrel of tar. After placing a gentle fire around it, only sufficient to warm it entirely, I applied one gallon of brine, made as strong as salt would make it, to every two gallons of the tar: taking as much of the above described quantity of brine as was necessary to mix the red ochre to the consistency of gruel; then mixing the whole together, and stirring it till entirely united. This, I find, produces a better body than any other produce heretofore by the tar and ochre alone.—and when the advantages (of lessening the quantity of tar, the superior cement thus formed, together with the generally very desirable effect the salt will have to resist the ravages of fire, shall be placed in the scale of the additional expense of salt, which does not, I think, exceed a peck to each barrel of tar, (and that used by me was dirty fish salt) shall be tested by the experimentalist. I am induced to think, he will also recommend the plan to his fellow citizens. A VIRGINIAN.

N. B. The above should be applied boiling hot.

On the use of chilled Cast-iron, for Punches, and other tools.—It is well known, that in making holes in red-hot iron articles, such for instance as wheel-tire, horse-shoes, &c.: the hardened and tempered steel punches become softened, from the effect of the heat—and, changing their shape, must be repaired from time to time.

Mr. Peter Keir, engineer, of St. Pancras, several years since, having occasion to make many nail-holes, in the wheel-tire of artillery carriages, and horse-shoes; and having experienced the above inconvenience in a great degree, luckily thought of substituting punches made of chilled cast iron, for those of steel, and which he found fully to answer the purpose, as they constantly retained their original hardness, notwithstanding they very frequently became red-hot in using.

As, however, chilled cast-iron is not sufficiently tough to bear bending, without breaking, he found it necessary to strengthen his punches, by surrounding and inclosing their stems in cast-iron holes, made of shapes corresponding with the stems, in properly shaped supports, and having their points only standing out a sufficient length for use.

KIDNEY POTATOES.

MR. EDMOND.—An opinion has long prevailed with our Farmers, that kidney potatoes do not yield as much as other kinds. In order to prove its fallacy, I last year planted a piece of fallow ground sixty feet by ninety. I spread thereon eight waggon-loads of coarse yard manure and ploughed the ground (which was of a heavy loam) very deep.—On the first of July I planted my potatoes, the hills being about two feet apart; and at the season for securing them, they were dug and carefully measured, and yielded me fifty-one bushels. The result of this undertaking has convinced me that it is more to my profit to make my ground good in the off-set than in the usual way of skimming over the surface; and, I am fully of opinion, the steady demand for this article, and the advanced price in market (should the yield be not equal to some others) makes it much more to the interest of our farmers to turn their attention more fully to their cultivation. Yours, &c. A FARMER.

N. Y. Farmer.

From the N. Y. Evening Post.

BONE-SET.

Among the many proofs in favour of American plants for the cure of diseases, the *Honey of Bone-set*, prepared at the *New York Infirmary for Bone Complaints*, No. 139 Grand street has been found most important. Its efficacy in the coughs and colds of this season, has excelled all other known remedies; it gives immediate relief to all those who have the asthma, and is used without danger of injury to persons of all ages and constitutions. Many children have been cured of the croup, (or hives,) whooping cough, and difficulty of breathing, for the sum of 50 cents; and several adults have used it to advantage in cases of consumption, where, if it has not caused a perfect cure it in all cases adds much to the ease and comfort of the patient. It quickly checks a severe fit of coughing, heals the soreness of the breast, promotes expectoration and allays the irritation that attends lung complaints, and in large doses it operates as an emetic. Those who do not wish to pay for the preparation and can take the nauseating draught of *Bone-set* tea, will derive good from the adoption of it, which can be had for little or no expense. One or two phials of the *Honey of Bone-set*, proves its valuable effects to all who use it. G. G. V. No. 139 Grand-street.

FLORIDA.

Judge Robinson, of Gadsden county, has succeeded after several years experiments in raising beautiful bright yellow Sugar, of a fine flavor. He expects a heavy crop next year. Several other planters intend embarking in the business.

FOR THE NEW ENGLAND FARMER.

SUGGESTIONS ON FISH PONDS, ANIMAL MANURES, &c.

MR FESSENDEN—There is one branch of farming or rural economy, which has been considerably practised in England, which I think could be profitably attended to in Massachusetts. I refer to fish ponds. You some time since published an abstract of some particulars detailed in the Transactions of the Royal Society;* and also mentioned that the *Cusk*, a sea-water fish had been naturalized in the waters of Winipisogee Lake. I think the project of rearing salt water fish, in fresh water ponds, has been proved to be practicable in Europe, and that it deserves more attention in this country. There are very many fine ponds that would answer this purpose in Essex and Middlesex counties, and particularly Long Pond in Worcester. I even think the subject worthy the notice of our Legislature; they annually pay some attention to the regulation of "Shad and Alewives."

This subject appears to me worthy the consideration of farmers even as a means of producing animal manures. There is a fine article on page 310, vol. iii. of the New England Farmer, on this subject, by Mr Briggs, of Bristol, R. I. to which I would refer your readers. Mr Briggs details the manner of using them, and the great advantages that accrue to grass lands by the application of this manure. And the subject is one of importance certainly, as furnishing an article of food, unailing and wholesome—as another means of supplying our interior markets—of feeding cattle, hogs, &c.—and improving and increasing the resources of the state. I have recently looked over the five volumes of the New England Farmer, some of the County Agricultural Surveys of England, Hunter's Geographical Essays, and several other Agricultural works, all of which seem to confirm the importance of the subject. Those of your readers who wish to examine the subject further, are referred to the New England Farmer, vol. ii. page 205—vol. iii. pages 221, 310, 330, 365, 403—vol. iv. page 371—vol. v. page 176. I think it would be well for our Massachusetts Agricultural Societies to imitate that of Rhode Island, and offer premiums for Fresh Water Ponds well stocked with particular kinds of Fish for the purposes of the table, the arts, manufactures, &c.

Yours, &c. F. H. P.

From the Delaware Weekly Advertiser.

CHEMISTRY APPLIED TO AGRICULTURE.

A paper read before the Delaware Academy of Natural Science, December 1, 1827.

The impoverished condition of a large portion of land in this State, and the consequent decline of wealth and population in some parts of it, calls for the attention of the citizens at large, as the interests of every individual are in a degree connected with the welfare of the whole community. That this state of things is in a measure owing to ignorance of the scientific principles upon which agriculture depends, may safely be inferred.

It is therefore quite consistent with the spirit of this institution, which proposes inquiry into Science for mutual edification, and the public good, that the labors of its members should be directed to the devising of a remedy for this evil, which seems to call for a series of plans for improve-

ment, founded upon inquiries into the causes which have led to the deterioration of the soil—a more perfect development of the process of vegetation, and details of the various improvements adopted by our neighbors in their mode of cultivation. In the hope that some member more competent to the task, and enjoying more leisure than I now do, will turn their attention to the subject, I have sketched out some rough outlines and crude remarks connected with it.

The Sciences most important to man are those connected with his nourishment.—Agriculture, therefore, is to him a subject of primary interest. The successful application of it depends on a knowledge, the fundamental principles of which are derived from Chemistry, and form a branch of that Science and is called Agricultural Chemistry; this has for its object all the changes connected with the growth and nourishment of Plants—the constitution of soils—and the manner in which lands are rendered fertile by different modes of cultivation, by the application of manure, or a change in the constituents or texture of the soil. Equories of such a nature cannot but be interesting; to the farmer they supply the principles on which the theory of his art depends, and are useful in directing his labors to a sure plan of improvement. To the man of Science they afford an ample and interesting field for labor, and to all, they present innumerable and pleasing proofs of the wisdom and goodness of the Creator.

Plants hold a middle place between inorganic matter and animated beings. They receive their nourishment from external elements, and assimilate it by means of peculiar organs. It is therefore by an examination of their component parts and the modifications they undergo, that the scientific principles of agricultural chemistry are obtained.

If plants be submitted to chemical analysis, it is found, notwithstanding their infinite diversity, that they are chiefly formed of three elements, Oxygen, Hydrogen and Carbon. These, with all other substances found in plants, are derived from the sap which is extracted from fluids in the soil, and altered by, or combined with, principles derived from the atmosphere. It follows, therefore, that the superstratum of the earth, the atmosphere and water deposited from it, afford all the principles concerned in vegetation.

That a particular mixture of the various earths in the soil is connected with fertility, cannot be doubted: yet as the earths which generally abound in soils, viz: Clay, Sand, Lime, and Magnesia, are only found in plants in exceeding small portions, we must believe their chief use is to support the plant, and to enable it to fix its roots, that through its tubes it may derive nourishment from substances mixed with the earths.

That water is essential to vegetation, is fully established, as its elements exist in all the products of vegetation, and it is known that no manure can be taken up by the roots of plants unless water is present. The elements of atmospheric air also enter into the composition of plants, it being in part decomposed by them.

Some persons have maintained that water alone was sufficient for the nourishment of plants. but their experiments & deductions have been shown to be erroneous, and it is more generally believed that neither water, nor air, nor earth, supplies the whole food of plants, but that all operate in the process of vegetation.

Air and water being almost beyond the control of man, it is on the earth chiefly that his influence may be exerted. The modification of the soil, by an alteration of its constituents or texture—by the application of manure—and by a suitable succession of crops, are placed within his reach;—and to these his attention must be given.

1st. *Of the Constituent parts of Soils.*—The substances which constitute soils are, viz: clay, sand, lime, and magnesia: oxides of iron and magnesia animal and vegetable matters—saline acids and alkaline combination; no definite mixture of which can be pointed out as a standard of fertility, which must vary with the climate, and be influenced by the quantity of rain, and the different plants intended to be raised,—their productiveness is also influenced by the sub-soil on which they rest.—When soils rest immediately upon a bed of rock, they become dry by evaporation, sooner than where the sub-soil is of clay. A clayey sub-soil will sometimes be of an advantage to a sandy soil, by retaining moisture, and a sandy or gravelly sub-soil often correct too great a degree of absorbent power in the true soil.

The most simple mode of ascertaining what particular item is the cause of unproductiveness in a sterile soil, is to compare it with fertile soil in a similar situation. The difference of the compositions will in most cases, indicate the most proper method of improvement.

If, for instance, it is found to contain the salts of iron, or any sour matter, it may be improved by the application of lime. If there be an excess of limestone in the soil, it may be improved by the application of sand or clay. Soils too abundant in sand, may be improved by the application of clay—a deficiency of vegetable or animal matter must be supplied by manure—an excess of vegetable matter requires the application of earthy materials; and marsh lands must be drained, as stagnant water is injurious to all the nutritive classes of plants. The labor of improving the texture and constitution of the soil is repaid by great advantages. The land is rendered permanently productive, and requires less manure.

2d. *Of Manures.*—The chief operation of manures is to supply food for the nourishment of plants, thus accelerating vegetation, and increasing the products of crops. Some, however, have a two-fold operation, and others are supposed to act as stimulants.

Gypsum, Plaster, or Sulphate of Lime.—Great difference of opinion has prevailed with regard to this article. The comparative small quantity used indicates a mode of operation different from other manures—recently, however, the matter has been explained—it appears that Gypsum is a constituent part of most artificial grasses, of clover, and of the soil producing these crops; when therefore, lands cease to produce good crops of artificial grass, indicating an exhaustion of gypsum, they may be restored by the use of this manure.

Lime, in its natural state, acts merely by forming an useful earthy ingredient in the soil; and it seems an essential ingredient in most fertile soils. When burnt, and recently slacked, it acts by decomposing inert vegetable matter, thus rendering it proper food for plants absorbing at the same time carbonic acid, which restores it to its former mild state;—hence its extensive use in the preparation of wheat crops.

It may be advantageously used in bringing into a state of cultivation all soils abounding in hard

* See page 34 of the current volume of the N. E. Farmer.

roots, dry fibres or inert vegetable matter, and all soils which do not effervesce with acids will be benefited by it. It should not, however, be applied with vegetable or animal manures.

INDIAN CORN.

The Indian corn, now a staple production of New England was very early known to the pilgrim planters. We learn from Morton, that on the 16th of November, 1620, a company sent out from the first ship to look for a place of habitation landed on the Plymouth coast, and "having marched about six miles by the sea side, espied five Indians, who ran away from them, and they followed them all that day sundry miles, but could not come to speak with them: so night coming on, they betook themselves to their rendezvous, and set out their sentinels, and rested in quiet that night?" (as is stated in Davis's Morton, near Stout's creek,) "and the next morning they followed the Indian's tracks, but could not find them nor their dwellings, but at length lighted on a good quantity of clear ground near to a pond of fresh water" (in Truro) "where formerly the Indians had planted Indian corn, at which place they saw sundry of their graves: and proceeding farther they found new stubble where Indian corn had been planted the same year, also they found where lately an house had been, where some planks and a great kettle was remaining, and beaps of sand newly paddled with their hands, which they digged up and found in them divers fair Indian corn in baskets, some whereof was in ears, fair and good, of divers colors, which seemed to them a very goodly sight having seen none before; of which varieties they took some to carry to their friends on shipboard, like as the Israelites spies brought from Eshcol some of the good fruits of the land; but finding little that might make for their encouragement as to situation, they returned, being gladly received by the rest of their company." On a second expedition soon after, corn and beans of different colours were found.—"And here is to be noted a great and special mercy to this people, that here they got them corn the next year, or otherwise they might have starved, for they had none, or any likelihood to get any until the season had been passed, neither is it likely that they had had this, if the first discovery had not been made, for the ground was now all covered with snow, and hard frozen: but the Lord is never wanting unto those that are his, in the greatest need. Let his holy name have all the praise.—*Davis's Morton* 40.

This beautiful native of New England, peculiarly adapted to the climate of the North, has become one of the staples of our country. Its bright green leaves are the best riches of the garner.—The ripples that chase each other over the grain fields of England, have been celebrated in song; but few natural objects can surpass the deep verdure—the rich luxuriance, and the graceful proportions of the corn in those wide plantations, which stretch over plain and hill side. The Indians, at the present time, have a mode of converting the products of their fields into rich ornaments, by briding the corn ears together by their husks in long strings, and hanging them from the roof to the ground floor of their wigwams. The compact series of columns thus formed, is interspersed, at regular intervals, with strings of red ears and a wainscot is formed more beautiful than the chissel of the sculptor ever traced on the walls

of palace or temple. These walls, however, are gradually reduced to supply the consumption of their inmates, and the unornamented bark soon peeps out beneath.—*Worcester Argis*.

Indian corn, or Grain of any kind, which is musty, remedy for.

Immerse it in boiling water, and let it remain till the water becomes cold. The quantity of water should be at least double the quantity of corn to be purified.

RURAL SCENERY.

Landscape and Picturesque Gardens.—Among the embellishments which attend the increase of wealth, the cultivation of the sciences, and the refinement of taste, none diversify and heighten the beauty of rural scenery, more than picturesque and landscape gardens. And perhaps, no section of the United States has so many eligible locations, or is capable of receiving so great embellishment as the country adjacent to the flourishing city of New York. For a number of miles around, in every direction, nature has given every variety of surface, and every assemblage of requisites, which constitute a delightful prospect. We have our declivities gently sloping to the water's edge—our islands girt by the flowing streams—our bold and rocky shores, overshadowed by the trees of the forest—our lofty heights, from which are seen the towering steeples, the curling smoke, the ripening fields, and the wide spread canvass—from which are heard the busy city, and the sweet music over the water.

For the introduction into this country of the design and execution of landscape and picturesque gardening, the public is much indebted to Mr. A. Parmentier, proprietor of the Horticultural Botanic Garden, near Brooklyn, two miles from this city. His own garden, for which he made so advantageous a choice, may give us some idea of his taste. The borders are composed of every variety of trees and shrubs that are found in his nurseries. The walks are sinuous, adapted to the irregularity of the ground, and affording to visitors a continual change of scenery, which is not enjoyed in gardens laid out in even surfaces, and in right lines. His dwelling and French saloon are in accordance with the surrounding rural aspect. In his gardens are 25,000 vines planted and arranged in the manner of the vineyards of France.

But that in the execution of which he has been most happy, is the landscape garden of Elisha W. King, Esq. of Pelham Manor, the plan of which he has shown us. The picturesque situation of the ground imparts a peculiar charm to the arrangement of the garden. From his mansion, which is built in the Grecian style, on the plan of that excellent artist, Mr. Martin E. Thompson, is a fine view of the bay of Cow Neck, and the light-house in front. On the left, we enjoy the view of an island belonging to Mr. King, of the Sound with its light-house, of the beautiful islands of Mr. Hunter, whose plantations add much to the prospect, and frequently of twenty or thirty vessels seen spreading their canvass to the winds, for the distance of eight miles. This fine country dwelling is likely to become one of the most ornamental on the East River, and will give an idea of the manner in which the Europeans embellish their country places. Plantations advantageously interspersed with ornamental and fruit trees, unite utility

with agreeableness, and greatly augment the value of the ground.

Mr. P. has very complaisantly shown us several other plans of gardens, which appear to us highly interesting.—*Ed. New York Farmer*.

A locksmith in Lexington, Ky. has manufactured a curious lock, which he intends as a present to Mr. Clay. "It is a splendid piece of workmanship." A premium of one hundred dollars and the lock itself, is offered to any one, who will in twelve hours time prove that he is able to open the escutcheon and unlock it, when fixed upon the door, having possession of the key and the means by which the proprietor can in one second of time unlock it with entire ease. No other instrument is to be used except the key."

On Friday evening, a fine young man, aged 22 while occupied in carrying apples from the orchard of his employer, Mr. Vines of Whelford, near Fairford, in this county, hastily ate a ripe plum, containing a wasp, the immediate and distressing consequence of which admitted of no remedy. Surgical aid not being on the spot, pain at the upper part of the trachea, accompanied with rapid symptoms of suffocation followed, terminating the life of the sufferer in less than fifteen minutes.—*Gloucester Journal*.

Method of extracting Starch from Horse Chesnuts

First take off the outward green prickly husks and then, either by hand, with a knife, or other tool, or else with a mill adapted for that purpose, very carefully pare off the brown rind, being particular not to leave the smallest speck and to entirely eradicate the sprout or germ. Next take the nuts, and rasp, grate or grind them fine into water, either by hand or by a mill adapted to that purpose. The pulp which is thereby formed in this water, must be washed as clean as possible through a coarse hair sieve, then again through a finer sieve, and again through a still finer, constantly adding clean water to prevent any starch adhering to the pulp. The last process is to put it with a large quantity of water (about four gallons to a pound of starch) through a fine gauze muslin or lawn, so as to entirely free it from all bran or other impurities; as soon as it settles pour off the water; then mix it up with clean water, repeating this operation till it no longer imparts any green, yellow or other colour to the water; then drain it off till nearly dry, and set it to bake, either in the usual mode of baking starch, or else spread out before a brisk fire, being very attentive to stir it frequently to prevent its burning, that is to say, turning to a paste or jelly, which, on being dried, turns hard like horn. The whole process should be conducted as quickly as possible.—*English pa*.

Blacking Balls for Shoes.

Mutton suet, four ounces; bees' wax, one ounce; sugar candy and gum-arabic, one drachm each, in fine powder; melt these well together over a gentle fire, and add thereto about a spoonful of turpentine, and ivory and lamp black sufficient to give it a good black; whi'e hot enough to run, you may make it into a ball, by pouring the liquor into a tin mould; or let it stand till almost cold, and you may mould it into what form you please by the hand.—*Ibid*.

Observations on the Medicinal Efficacy of

WHITE MUSTARD SEED.

Written by a gentleman in Lincolnshire—from his personal experience—and originally circulated by him for the general benefit.

"In the month of June, 1822, I first made trial of the White Mustard Seed, merely as an aperient; when the generally improved state of my feelings, which immediately followed, inclining me to give it credit for other medicinal properties of at least equal value, I gave it to some of the sick poor in the neighborhood, with a success that excited my astonishment.—From that time to the present I have been in the habit of recommending it very generally, and the opinion which I have always entertained is now fully confirmed, that the public are not aware of its very extraordinary powers, nor of the very great variety of cases to which it is applicable: and that in order to its general adoption as a remedy for disease, its virtues require only to be known, to be adequately appreciated.

The White Mustard Seed is an almost certain remedy for all complaints connected with disordered functions of the stomach, liver and bowels, and has been eminently successful in the following cases:—In tendency of blood to the head, headache, weakness of the eyes and voice, and hoarseness; in Asthma, shortness of breath, wheezing, cough, and other distressing affections of the chest; In Indigestion, oppression after eating, heartburn, sickness, wind and spasms, cramp, and other uneasy affections of the stomach; in debility, uncasiness, pain and sense of tenderness and soreness in the interior, and particularly at the pit of the stomach, and in pain in the sides, and the lower part of the body; in all complaints arising from bile, scirrhus liver, and other morbid affections of that organ; in deficient perspiration, gravel, scanty and unhealthy state of the urine, and other disorders of the skin and kidneys; in relaxed and irritable bowels, flatulence, and occasional, or habitual costiveness; in severe colds, rheumatism, lumbago, spasms and cramp in the body or limbs, partial and general dropsy, palsy, coldness of the limbs and feet; and in loss of appetite, failure of sleep, weakness of nerves, Depression of spirits, and general debility of the system. In Ague, Gout, Rheumatic Fever, Epilepsy, Scrofula, Scurvy, Piles, Erysipelas or St. Anthony's Fire, in the dreadfully painful affection called the Small Pox, Typhus and Scarlet Fevers, and other severe disorders, it has likewise been taken with very considerable advantage. For the long round worms, as well as the small white ones, it is also incomparably the best remedy, inasmuch as both in children and grown up persons, it not only destroys those reptiles, but if persevered in long enough to restore the tone of the stomach and bowels, will entirely prevent the recurrence in future.

The following case furnishes a striking proof of the extraordinary remedial power of the Mustard Seed. A very respectable Surgeon and Apothecary, whom I have long known, a person of regular and rather abstemious habits, who, during a period of thirty years, had sustained the fatigue of a most extensive country practice, with scarcely a day's illness, at the age of fifty-two was suddenly attacked with a severe pain in the left side and lower part of the body. Supposing the disease to arise from constipated bowels, he had re-

course to calomel, rhubarb, castor oil, and several other active aperients, without obtaining relief. He then took an emetic, was bled largely in the arm, used a hot bath, was blistered in the part afflicted, and lay for seventy hours in a most profuse perspiration. By this treatment the pain gradually abated; leaving him, however, at the end of four days extremely weak and emaciated. For the space of two years afterwards he had frequent and severe returns of the pain; and his constitution being undermined, the stomach, liver, and kidneys became sensibly affected; and indigestion, constipation and flatulence, were succeeded by every appearance of general decay. Having consulted several professional men, and taken a great variety of medicines during the period, but to no good purpose, in November, 1822, he made trial of the Mustard Seed; and it is remarkable that in a very few days after taking this remedy the pain entirely ceased, and has never since returned. The action of the affected organs was gradually improved, digestion was restored, the bowels resumed their functions, and at different times he was relieved by the discharge of several small portions of gravel. Encouraged by these advantages, he continued the use of the Seed with increased confidence. In November, 1823, he discharged with ease a large rugged oblong portion of gravel; and to use his own expression, his health had then, and some time before, attained a state of wonderful improvement.

The White Mustard Seed is also fully as valuable for the prevention as for the cure of disease; and of its power as a preventive, the following case is a remarkable illustration. A friend of mine had for five or six years previous to 1823, been regularly attacked with the hay or summer Asthma, in the months of June or July, in each of these years. The attacks were always violent, and for the most part accompanied with some danger; and such was the impressions made on his constitution by the disease, and the remedies resorted to,—of which bleeding and blistering were the chief,—that each illness led to a long confinement to the house, extending to a period of nearly three months. In the early part of 1823, he resolved to make trial of the Mustard Seed, in order to prevent, if possible, a recurrence of the complaint, and has since regularly taken a dessert spoonful about an hour after dinner, daily, to the present time; during which long period he has not only wholly escaped the disease, but his health has never been interrupted by illness of any kind, and has been progressively improving, until he is now enjoying a greater degree of strength and activity, and much better spirits, than he recollects ever to have had before. The most formidable bodily evils to which we are exposed, are well known to originate in colds, to which, from the extreme variability of our climate, we are peculiarly liable. As a means of preventing this fruitful source of disease, by obviating the beneficial effects of sudden exposure, the Mustard Seed has in most instances been remarkably successful. Ever since 1822, I have myself regularly taken it once every day; and during all this time I have never been troubled with the slightest cold, and have enjoyed an uninterrupted flow of health. A near relation of mine, whose life for many years had been frequently exposed to imminent danger from inflammatory affections of the chest, brought on by cold, of which he was remarkably susceptible, has also

happily experienced a similar advantage from it: and if persons of consumptive and delicate habits or otherwise constitutionally susceptible of cold, would avail themselves of this hint, and if all persons indiscriminately on the first attack of disease, would have recourse to the Mustard Seed for a few weeks, the extent to which human suffering might be thus prevented, would, it may reasonably be presumed, exceed all calculation.

In the White Mustard Seed are combined a valuable aperient and an equally valuable tonic; and thus, while it affords the most salutary and comfortable relief to the bowels, it never weakens, but on the contrary always strengthens, in a very remarkable degree, both those organs and the stomach, and ultimately the whole system. Its efficacy probably consists in a communication of energy and activity to those movements of the canal by which the aliment is propelled, and in this way perhaps it operates in animating and improving those secretions of the stomach, pancreas, and liver, by which digestion and chyfication, those most important functions in the animal economy, are effected. *It has very frequently succeeded when all other medicines have failed; it never loses its effect by use; it requires neither confinement to the house, nor any particular attention to diet; and, in the absence of decidedly inflammatory symptoms, is always safe.* In order to take it with advantage, the patient need only attend to its effects on the bowels, which, generally speaking, it is not designed to purge, but merely to maintain in an uniformly open and comfortable state; and in securing this effect, of which any one may easily judge for himself, the whole art in the use of the medicine consists.

After what has been already stated, it is almost superfluous to observe that the Mustard Seed is peculiarly adapted to the case of those, whose habits, situations, and conditions in life, render them more particularly liable to disordered functions of the stomach, liver and bowels; with the endless variety of distressing maladies flowing from those causes. Of this class are principally the studious and sedentary; persons whose constitutions have suffered from long residence in hot climates; Mariners and Sailors while at sea; Manufacturers and Mechanics of every description; Miners and such as work under ground; the indolent and intemperate; the poor who suffer from hard labor and scanty means of support, and persons advanced in years. To children also in the early period of infancy, the White Mustard Seed is highly beneficial not only as a remedy for worms but as a means of obviating the extreme debility of the stomach and bowels so frequently attached to their tender years.

The Mustard Seed is always to be swallowed whole, not broken nor masticated: and either alone, or in a little water, or other liquid, warm or cold; and the best general rules for taking it are the following:—Generally speaking, three doses should be taken every day without intermission; the first about an hour before breakfast, the second about an hour after dinner, and the third either at bed time or an hour before; those who dine late at six or seven o'clock, taking the second dose at two or three o'clock in the afternoon, and the third about an hour after dinner. Each dose should contain that quantity, which in the whole, shall be found sufficient to produce a healthy evacuation of the bowels every day. Two or three large ten-spoonful in each dose will generally

produce this effect, though with some constitutions much smaller doses will answer the purpose; but should that quantity fail, each dose may be increased to a table-spoonful; and in some instances a fourth table-spoonful may safely be added between breakfast and dinner. When this quantity fails to produce the desired effect on the bowels,—a circumstance which very rarely occurs,—it will be proper to assist the operation of the seed with a little Epsom salts, or other mild aperient, taken every morning, or second or third morning, as occasion may require, instead of the first dose of the seed, for the space of ten days or a fortnight, or such longer period as may be found necessary. And if the patient be troubled with piles, it will be advisable to relieve the bowels occasionally with a small tea-spoonful of milk of sulphur, and an equal quantity of magnesia mixed together in a little milk or water, taken at bed time, either with or after the dose of the seed.

In Palsy, Asthma, Ague, diseases of the liver, Rheumatism, and Worms, the seed should be taken somewhat more freely than in other cases, and in instances of long standing and great obstinacy, to the extent of four or five large table-spoonfuls in the course of each day, if the bowels will bear that quantity without much inconvenience; and in these as in other cases the patient must have recourse to Epsom salts, or any other mild aperient, or to the mixture of sulphur and magnesia, if necessary. When the seed is taken as a preventive by persons of consumptive and delicate habits, or otherwise constitutionally susceptible of cold, or by others for the purpose of preventing the recurrence of disease of any kind, or as a remedy for costiveness or any slight attack of disease, a single dose taken every day about an hour before breakfast, or which is generally to be preferred, about an hour after dinner, will very frequently accomplish the proposed object, provided it be sufficient in quantity to keep the bowels in an uniformly open and comfortable state.

I will close these observations by remarking, that a steady daily perseverance in the use of the Mustard Seed, according to the rules above recommended, for the space of two, three, or four months, and in many instances for a much shorter period, will seldom fail to convince the patient of the extraordinary efficacy and singular value of this very safe, cheap, and simple medicine.

I. T."

Early Vegetation.—Mons. A. Parmentier has at his Horticultural Garden, Brooklyn, beautiful asparagus, which he intends to serve up at the dinner to be given to-morrow at the Masonic Hall, in honor of St. John's Day. This is a vegetable extremely rare at this season of the year, and perhaps the first time it was ever seen so early at New York.—*N. Y. Enquirer, Dec. 27.*

The Pennsylvania Legislature have instructed their Delegation in Congress to use their influence in favour of an increase of duties on woollen and fine cotton goods, hemp, iron, glass, paper, and spirits. But eight voted against the instructions.

Anthracite Coal from Poughkeepsie.—We have been informed by the New York Journal of Commerce that at the last meeting of the Lyceum of Natural History, Professor Barnos presented some specimens of anthracite coal, said to have been obtained in the slate rock near Poughkeepsie. Professor Torrey, Major DeLafield, and other

mineralogists who were present had no doubt that the specimens presented were accompanied and united with anthracite coal. The coal was disseminated through quartz, and attached to the surface or portion of shale, clay slate, in small granular masses. One of the accompanying specimens was a piece of argillaceous schistus containing pyrites.

It fares with religion as with a shuttlecock, which is stricken from one to another, and rests with none. The rich apprehend it to have been designed for the poor; and the poor, in their turn, think it calculated chiefly for the rich.—An old acquaintance of mine, who omitted no opportunity of doing good, discoursed with the barber who shaved him, on his manner of spending the sabbath, (which was not quite as it should be,) and the necessity of his having more religion than he seemed at present possessed of.—The barber proceeding in his work of lathering, replied, "that he had tolerably well for a barber; as in his apprehension, one-third of the religion necessary to save a gentleman would do to save a barber." *Bishop Horne.*

The editor of the Stonington (Conn.) Telegraph has undertaken to persuade his readers to use Lehigh and Schuylkill coal, in their shops, parlours, &c. not only as being cheaper than wood, but that the demand which necessarily exists for wood, may be hereafter supplied. It is a fact, that the prodigal axes of our fathers, and their capacious and all devouring fire-places, have left us little to boast of in the forest way, and our friends at the eastward will find their future prospects brightened, and their present situation rendered comfortable, by a free use of anthracite, which, by a very simple and exceedingly cheap contrivance, may be burned in a common tin plate stove, with as much convenience for culinary purposes, as hickory or white oak.—*U. S. Gazette.*

Value of Poetry.—Poetry is a most unprofitable drug, at least in the American market. Lord Byron did not find it so, however, as will be seen by the following statement:

Sums paid to Lord Byron, by the bookseller, Murray, as the price of the manuscripts of his works—			
Childe Harold, Cantos I and 2,	\$3,000	}	\$30,500
“ “ “ 3d,	7,500		
“ “ “ 4th,	10,000		
The Giaour, - - -	2,500		
Bride of Abydos, - - -	2,500		
Corsair, - - - - -	2,500		
Lara, - - - - -	3,300		
Siege of Corinth, - - -	2,500		
Parisina, - - - - -	2,500		
The Lament of Tasso, - - -	1,500		
Manfred, - - - - -	1,500		
Beppe, - - - - -	2,500		
Don Juan, Cantos I and 2,	7,300	}	14,600
“ “ “ 3 and 4,	7,300		
Doge of Venice, - - -	5,300		
Sarandapalus, Cain & the Foscuri,	5,300		
Mazeppa, - - - - -	2,500		
Prisoner of Chillon, - - -	2,500		
Miscellaneous Pieces, - - -	2,100		
			\$74,220

This is a pretty little fortune to make by poetry, and a very great incitement to scribbling.—The estimated value of the poems appears to have been determined without any reference to

their respective merits. If Mazeppa be worth \$2,500, Manfred is barely worth \$8,000. It would be a curious task to calculate how much his lordship received for each word in Mazeppa. The time occupied in its composition was perhaps 24 hours, (not all at one sitting). An industrious poet, paid at this rate, would soon have six Pegasuses to his barouche.—*N. Y. Morn. Courier.*

Mrs. Sarah J. Hale the author of "Northwood," is about publishing a monthly periodical, in Boston, to be entitled Ladies' Magazine. Such a work must receive an extensive patronage from the intelligent ladies of the U. States. We may anticipate in it much that will have a tendency to elevate the female character, and give to our ladies an intellectual rather than a merely fashionable taste. *R. I. American.*

It appears by a statement in the last Stonington (Con.) paper that the return cargoes of Seal-skins of vessels belonging to that port and which have been sold by auction in that place since 1819, amounts to \$310,747.

To preserve frozen Potatoes.—When potatoes are frozen, soak them for 3 hours in cold water before cooking them. If they are frozen very hard dissolve a quarter of an ounce of saltpetre to every peck, and add it to the water. Frozen potatoes will yield more flour for starch than fresh ones. That flour with as much wheat-flour, some butter, sugar, yeast, and currants, will make excellent 'tea bread,' which will keep a month. *Hartford Times.*

From late English Papers.

We understand that the Chinese 'Tallow Tree,' or *Sedum Fecoides* of Linnæus, has been introduced into the Mauritius, and cultivated with the greatest success. Two hundred barrels are daily expected as a sample, and the quality is said to be equal to any melted from the fat of animals. The quantity may be produced to any extent; and we believe, is likely to supersede the trade with St. Petersburg, for that article altogether.

It appears by an authentic estimate made recently in London, that no fewer than fifteen thousand boys, between the ages of eight and fifteen, live by theft, in that capital.

The Countess of Morton has presented to the Royal Society a variety of models, formerly the property of Smeaton the engineer, together with several drawings and plans of the Eddystone.—Among the other curiosities accompanying this donation, is the mass of lead which was taken from the stomach of the poor man who swallowed it in a fluid state, during the conflagration of the wooden structure which preceded Smeaton's far famed light-house. This man lived for some time but died in consequence of the accident in Exeter Infirmary, when the production of the lead convinced his medical attendants that his story was correct, of which they were till then sceptical.

Caledonian Mercury.

Another Gigantic Hydrangea.—We lately mentioned that a gigantic hydrangea was growing in the Earl of Roslin's garden at Dysart House, which measured 40 feet in circumference, and on which there were 605 flowers. A gentleman belonging to this city was in South Wales on the 8th instant, and in the garden at Amroth Castle,

he was equally astonished and delighted with the beautiful and majestic appearance of one of these plants. On examination it was found to measure 33½ feet in circumference, and on it were found the astonishing number of 832 handsome flowers. There is every probability that this is by far the greatest number of flowers ever seen in this country, on any of these splendid plants grown in the open air.—*Scotsman*.

"Why are you so melancholy," said the Duke of Marlborough, to a soldier after the battle of Blenheim. "I am thinking," replied the man, "how much human blood I have this day shed for sixpence!"

We are informed there were, a few days since, 22 vessels taking in and unloading Rough Rice for the London and Liverpool Markets, in Ashley River, near the Charleston Bridge.

Remarkable Hybrid.—There is at present, at Berlin, an animal produced between a stag and a mare. The appearance of the creature is very singular—the fore part is that of a horse, and the hinder part, that of a stag; but all the feet are like those of the latter animal. The king has purchased the Hybrid, and sent it to the Pfanensiel, at Potsdam, where there is a menagerie.

An action was brought in the Court of Common Pleas, (London) by a person who had been injured by a mischievous bull, against the owner of it. A verdict was found for the plaintiff;—Damages £105.

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JAN. 4, 1828.

[The subscribers suggested by F. H. P. not noticed in his communication in this week's paper, will be attended to as occasion may offer.]

WASTE LANDS SUBDUED.

It appears by certain statements, and calculations, in the last number of the London Quarterly Review, that in Great Britain, "since the commencement of the last century, upwards of six millions of acres of land have been brought into a state of tillage; and, that no less than eleven parts in twelve were inclosed in one reign, that of George III., the steady and constant patron of agriculture.

"Notwithstanding these praiseworthy exertions, it is estimated that England alone, still contains about six millions of acres of waste land, yielding but little produce; and that, including Scotland and Ireland, the quantity of waste land in this Kingdom cannot fall short of thirty millions of acres. How much of this may be incurably lost, it is impossible to ascertain exactly;—but there is every ground to believe that a very large proportion of it is capable of being rendered highly productive, under a skilful and energetic system of tillage. Upwards of two hundred years have now elapsed since the British government has almost exclusively directed its attention to the cultivation of its foreign possessions, leaving the improvement of its territory at home to the exertions of individuals. It is not too much to say, that this country has expended upon the cultivation of its foreign colonies, a sum which does not fall short of fifty millions; and upon wars arising from its connexion with those colonies, no less than two hundred millions. If a moiety of this sum had been expended upon our own territory, no rational man can doubt that extensive tracts of

land which are now waste, would have been reclaimed, and that an incalculable addition would have been made to the produce and population of the country. "Industry," says Harte, in his admirable essay, "is the *vis matrix* of husbandry, and an ancient English writer well observes, that a single uncultivated acre is a real physical evil in any state."

It would be not only curious, but useful, to calculate, as near as possible, the quantity of waste land in the older and more populous parts of the United States; and also to form some estimate of the quality of such land, and what it is capable of producing when reclaimed and well cultivated. A great part, and perhaps the greater part of the waste lands in New England, consists of swamps, and land naturally too wet to produce any kind of vegetation which is useful to man or domesticated animals. This land, however, in general, when drained, subdued, and judiciously tilled, is much more valuable than the uplands, which being cleared and cultivated with less labor, attracted the first attention and monopolized the first efforts of our first settlers. It is hardly too much to say, that the best lands in Massachusetts, (on an average) are still in a state of nature; and although it would require much labor and expense to subdue them, their superior value when subdued would amply compensate for their subjugation.

Another kind of waste lands, of which there are great quantities in all parts of the United States, are called pine plain and shrub-oak lands. These are reclaimed with less difficulty, and are very easily tilled, when once brought under the plough. These lands, with aid of gypsum, clover, turnips, &c. may be made perhaps as profitable as the stronger and stiffer soils, which are generally held in much higher estimation.

LIQUID MANURE.

As a farmer, like a chemist, should lose none of his materials, but even make his washings, runnings, and residuums turn out to his advantage. I have sent you some account of an experiment I have made in manuring land which I beg you will lay before the committee of agriculture, that they may communicate to others.

I am possessed of a farm of near three hundred pounds a year, and have in my yard what you usually see in farmers' yards, two recesses or pools, as reservoirs of dung and water. These reservoirs are continually running over, and of course a part of the matter contained in them is carried off by the necessary drains, into the high ways, ditches, and rivers.

As much of the essential quality of the dung is lost in this manner, (for parts of the salts, whether fixed or volatile, will be washed into the pools, and when they run over, will be conveyed into the ditches, &c.) I thought it good husbandry to carry this superabundant water or manure, (for so we may justly call it) on my land, which I did by means of a watering cart, not unlike those with which the roads near London are watered in the summer time to allay the dust.

That the experiment may be the more obvious and certain, I first tried it in the beginning of March on a few acres, in the middle of a large field of wheat, where, in a little time, I found a considerable increase of growth, both of grass and grain; and at hay time and harvest both the one and the other were much better crops than what the same lands produced that were not so manured.

As a man, or even a boy, with one of these carts, and one horse, may manure a great deal of land in a day, provided it be near the yard, I would recommend the practice to all farmers; for the expense is nothing but the value of the time of the boy and horse, and the increase, by what I have seen, will be very great.

This manure may be also laid to great advantage on land, that is fresh sown with barley, oats, or any other grain; but on grass it should be laid in the spring, when the lands are laid up for hay, as the cattle will not feed on grass, while the dung or its essence or salts adheres to the herbage.

This dung water should likewise be carried on the land, not at a time when it rains, but in dry weather, and at a time when the dung water in the pool is of a deep brown color, and strongly impregnated with salts. By this means, the land may be manured from time to time, and the pools kept almost empty for the reception of fresh matter whenever it rains, and thus nothing will be lost.—*English Publication*.

In order to form a proper repository for that part of the farmer's liquid manure which consists of the washings of the farm yard, the yard itself should be situated and formed according to the following directions by Judge Bue, of Albany:

"I will now suggest a cheap and practicable mode of providing food for vegetables, commensurate to the means of every farmer of ordinary enterprise; and that my suggestions may not be deemed theoretical, I will add, that 'I practise what I preach.'"

"The cattle yard should be located on the south side of, and adjoining the barn. Sheds, substantial stone walls, or close board fences, should be erected, at least on the east and west sides, to shelter the cattle from cold winds and storms, the size proportioned to the stock to be kept in it.—Excavate the centre in a concave form, placing the earth removed upon the edges or lowest sides, leaving the borders ten or twelve feet broad, of a horizontal level, to feed the stock upon, and from two to five feet higher than the centre. This may be done with a plough and scraper, or shovel and hand-harrow, after the ground is broken up with the plough. I used the former, and was employed a day and a half, with two hands and a team, in fitting two to my mind. When the soil is not sufficiently compact to hold water, the bottom should be bedded with six or eight inches of clay, well beat down, and covered with gravel or sand. This last labor is seldom required, except where the ground is very porous. My yards are constructed on a sand loam, resting on a clay subsoil. Here should be annually deposited, as they can be conveniently collected, the weeds, coarse grass, and brakes of the farm; and also the pumpkin vines and potato tops. The quantity of these upon a farm is very great, and are collected and brought to the yard with little trouble, by teams returning from the field. And here also should be fed out, or strewed as litter, the hay, stalks, and husks of Indian corn, pea and bean haulm, the straw of grain not wanted in the stables. To still further augment the mass, leached ashes and swamp earth may be added to advantage. These materials will absorb the liquid of the yard, and becoming incorporated with the excrementitious matter, double or treble the ordinary quantity of manure. During the continuance of frost the excavation gives no inconvenience; and when the

weather is soft, the borders afford ample room for the cattle. In this way, the urine is saved, and the waste incident to rains, &c. is prevented.—The cattle should be kept constantly yarded in winter, except when let out to water, and the yard frequently replenished with dry litter. Upon this plan, from ten to twelve loads of unfermented manure may be obtained every spring for each animal, and if the stable manure is spread over the yard, the quality of the dung will be improved, and the quantity proportionally increased.—Any excess of liquid that may remain after the dung is removed in the spring, can be profitably applied to grass, grain, or garden crops. It is used extensively in Flanders, and in other parts of Europe.”

It would be an important addition, to the above plan, if a pool, cistern, basin, well, or reservoir were formed in the centre of a yard constructed as above, and so located as to receive not only the wash of the yard, but the liquid manure from the stable. This should be sufficiently large to drain off and contain most of the superabundant moisture from the manure in the yard; which, if too wet, will give out unhealthy exhalations, besides being of less value as food for plants. The reservoir should have a movable top or cover with grating or small holes, which will admit the liquid but exclude the solid part of the manure; and the former should be pumped out or otherwise taken and applied as above directed. [See N. E. Farmer, Vol. V. page 161, 162.]

REMARKABLE VINE.

In Speckly's Treatise on the Vine there is given a drawing of a remarkable vine growing in Northallerton in Yorkshire, that once covered a space containing 137 square yards; and it is judged, that if it had been permitted, when in its greatest vigour, to extend itself, it might have covered three or four times that area. The circumference of the trunk, or stem, a little above the surface of the ground, is three feet eleven inches. It is supposed to have been planted 150 years ago; but from its great age, and from an injudicious management, it is now, and has long been, in a very declining state. There are many other vines growing at Northallerton, which are remarkable for their size and vigor. The soil is light and rich, of a dark color, and inclining to sand. An English gentleman informs us, it has been known to produce a ton of grapes in a year.

Useful Hints relative to Carters and Teams of Oxen.

Do not retard the growth of your beasts of draft, endanger their health, and render them insignificant in the eyes of many by working them hard while too young. There is no danger of their becoming unmanageable; nose rings reclaim them, be they ever so vicious; nevertheless the younger they are inured to light work, the more docile they will generally become.

Do not expect that they can work constantly on straw, nor expect to find them alert and spirited while their thighs are clodded with manure, and their coats throughout are filled with dirt and vermin.

An English writer recommends carding oxen, and says "the ox after the sensation becomes familiar, receives pleasure from the operation, and will momentarily forego his meal to receive the full enjoyment. His feeder perceives this and

brushes the part which gives the most pleasure. The ox shows his gratitude by wagging his tail; the feeder in return calls him by name and ingratiates himself with him. Thus not only an intimacy, but a mutual affection is formed, which at once gives attention to the keeper and docility to the ox, and renders the labour of both pleasant.

"Their labour and their fodder ought to be proportioned that their health and their spirits may be kept in full tone. Their coats ought to be sleek; their hides loose and silky; the flank should fill the hand; and the shoulder handle mellow.—If they be over-worked, or under fed, sluggishness and disease will inevitably follow. A working ox ought always to be beef, that in case of accident, he may grace, at least, the poor man's table."

To cure beef.—The Tartars put lean beef under a heavy press, until no liquor runs from it, then chop and pound it, add sugar, unground pepper, clarified butter, and crumbs of bread, and work all together; roll it into cakes, and when thoroughly dried it is excellent. The Russians add bits of bacon, and tie it up in bladders or pots. It needs no cooking, and is thought to be superior to common potted beef or Bologna sausages.

Congress have made grants of land to certain emigrants from France, for the culture of the vine and olive.

A third establishment for the manufacture of White Flint Glass, will commence at Pittsburg on the first of January.

Boston Market.—Our market is now plentifully supplied with wild game; venison sells at 6 to 12 cents per pound.—Poultry 8 to 12.—The prices of country produce, generally, are advancing; Pork of the first quality sells readily at \$18 per barrel, at wholesale—Prime Mess Beef at \$10 per barrel—Dry Beans, best quality, \$1.50 per bushel.

The North American Review, for January, 1828, is just published by Frederick T. Gray, Boston, and G. & C. Carvill, New York;—and contains articles on the following subjects;—Chief Justice Marshall's Public Life and Services—Noyes's Translation of Job—American Missionaries at the Sandwich Islands—Hindu Drama—Republic of Central America—Bowring's Poetry and Literature of Poland—Debates in Congress—De Stael's Letters on England—American Annual Register—Fine Arts—Riedesel's Letters and Memoirs—Dana's Poems—Cadalso's Moorish Letters—The Talisman—Critical Notice—Quarterly list of New Publications.

Speckly on the Vine, Pine Apple, &c.

Just received, and for sale at the N. E. Farmer office, one copy of a Treatise on the culture of the vine; with new hints on the Formation of Vineyards in England; with a Treatise on the Culture of the Pine Apple, and the Management of the Hot House. Third London Edition, by William Speckly, with eleven engravings.

Siberian Parsley.

Just received at the office of the New England Farmer, a few seeds of the Siberian Parsley. This plant is perfectly hardy, stands the severest frosts, and would probably be the best sort to sow in the spring, as recommended in the last New England Farmer. It is also very useful in the culture in gardens. The Seed was introduced from Russia, a few years since, by a gentleman of this vicinity. Jan. 4.

Dutch Bulbous Roots.

Just received at the office of the New England Farmer, a further supply of fine double and single Hyacinths, Tulips, Narcissus, Tuberoses, Jacobean Lilies, Tiger Lilies, Ranunculus, &c. Also, a few POTATO ONIONS—with every variety of Garden Seeds, Flower Seeds, &c.

Cobbett's Agricultural Works.

Just received for sale at the office of the New England Farmer, "A Ride of eight hundred miles in France; containing a Sketch of the face of the Country, its Rural Economy, of the Towns and Villages, of Manufactures and Trade, and Manners and Customs—Also, an Account of the Prices of Land, Horses, Fuel, Food, Raiment, and other things, in different parts of the Country." By James Paul Cobbett, (son of William Cobbett.) London edition, price 75 cents.

Also, a further supply of the American Gardener; or a Treatise on the Situation, Soil, Fencing and Laying out of Gardens; on the making and managing of Hot Beds and Green Houses; and on the Propagation and Cultivation of the several sorts of Vegetables, Herbs, Fruits and Flowers. By William Cobbett.—London edition, with several engravings, price \$1.00. [This is probably one of the best Treatises on Gardening extant, (see review, perhaps, the more elaborate work of M. M. Choisy.) The directions in the American Gardener for the management of Grape Vines and Peach Trees are pronounced by experienced and competent judges, to be the best of any extant, and well worth, alone, the price of the book.—It has, likewise, very full directions for the management of Garden Vegetables and Ornamental Flowers.]

Cottage Economy, containing information relative to the making of Bread, brewing of Beer, keeping of Cows, Pigs, Bees, Ewes, Goats, Poultry, and Rabbits, &c. with instructions relative to the cutting, and the bleaching of the Plants of English Grass and Grain, for the purpose of making Hats and Bonnets. Price 62 cts.

Bremen Geese.

FOR sale, 10 pair superior BREMEN GESE. Apply to THOMAS WILLIAMS, Noble's Island, or to MR RUSSELL, at the New England Farmer office. Dec 7.

MISCELLANIES.

New Year's Address.

TIME, the most persevering body
Twixt New Orleans and Pass'maquoddy,
Who waits on beggars, treads on kings,
And makes aud mars all cartily things;—
Who forms a palace, or a shed—
A Newton's noll, a cabbage head
With equal ease—by whose assistance
All Being had and has existence—
The perpetrator of all crime,
(For every thing 's the work of Time,)
As well as source from whence proceeds
All noble and praise-worthy deeds;
In truth the *causa sine qua non*
Of all we have, hope for, complain on:

Another Year has brought to pass,
And turn'd the old Year out to grass.
And now, said all efficient wight,
Bids us attempt our annual flight,
O'er Heaven's high canopy to steer,
And hail the Advent of the Year—
Our hard-ship promising to crown,
And cup our climax of renown
With amarantine wreaths, more bright
Than splendid flamouts of light,
Which Day's Ascending Regent pours
Profusely from his golden stores,
Tinting the clouds, by zephyr riven,
With the most gorgeous hues of heaven.

But, stop—I apprehend that we
Have set out on too grand a key,
And must come down from heights immense,
To tread the ground of common sense;
On earth a Farmer's business lies,
Not sowing wild oats in the skies.
Thus some Psalms-singers I have known
To set the *tune*, but miss the *tone*,
And then proceed, in Jehu-style,
Above the key-note, half a mile:
And driving onwards, thorough stich
To A in all, at concert pitch;—
Now minims, crotchets, quavers, dash
Togeth' with discordant crash;—
And even the Fair, now read the *Air*,
The music rare, to fatters tear.—
(Ladies, though fair as flowers in June,
Will now and then get out of *tune*.)
Stave thro' the staves, like folks possess'd.
And murder one of Handel's best.
Finding the Choir against a stump,
The Leader, with commanding thump,
Now puts a period to the strain,
Gives a new pitch, and starts again.
So, having slightly scath'd our pinions
In Fancy's perilous dominions,
We, plow-hum-like, will plod along
Through the dull remnant of our song.

Last year exhibited abundance,
Amounting almost to redundancy,
Of prime productions of the soil,
To crown the Cultivator's toil.
Blessings have fall'n, like drops in showers,
Health, Peace, and Plenty have been ours,
And every earthly boon indeed,
Which Heaven bestows, or mortals need—
All that should lead us, on our part,
To thankful lips, and grateful hearts,
Kind Provid'ncs, with lavish hand,
Has scatter'd o'er a smiling land,
Earth's products are of such a size,
We scarcely can believe our eyes,
And almost doubt the evidences
Of all our conjugated senses.
For instance, Beets, the beat of all
The beets produc'd since Adam's fall—
Strawberries, which a man would guess
Were large as Peaches, more or less,
And Pears, approximating towards
The ordinary size of Goids;—
So big, that botanist will say to us
Their *gums* is *excurbitaceous*—
Meaning, thereby, to tell us bumptious
Said Pears have cross'd their breed with Pumpkins.
Are, therefore, being thus allied,
Sheer monsters on the mother's side

And wry-neck'd Squashes, which were found
To overload the solid ground,
And threaten, by mere dint of gravity,
To break the shell of Symmes's cavity.

Improvement's meliorating hand
Shines like a sun-beam thro' the land.
Here, docks and wharves, new streets and stores
Emboss old Ocean's smiling shores.
Teeming with products of all nations—
These factories rise like exhalations.
Here, Toil his task Herculean plies,
There, *Art* bids new *Creations* rise,
And HOME-SPUN WOUNDS obey the will
Of human industry and skill!
These means subserve the Farmer's ends;
Here dwell those ready-moned friends,
Who raise the value of his lands
And take that surplus off his hands,
Which otherwise were useless trash,
And metamorphose it to cash;
Just as one Midas, we are told,
Turn'd every thing he touch'd to gold.

Did it not look like ostentation,
And trumpeting self-approbation,
We verily might say, with verity,
We add our mite to this prosperity
By fabricating head-work, which is
Harder by half than digging ditches.
And while we toil with lusthood
For every individual's good,
I should madly lectures giving,
To teach all men to get a living,
We're wide awake to every movement,
Which tends to national improvement.
We therefore, may, we apprehend,
Be christen'd Every-body's Friend;
A wight who has the World at large
Committed to his special charge,
To oversee whatever is late
To incomes, outgoes, goods, estates,
And tell their owners how they may
Increase them in an honest way.

Our wisdom merits a position
Along side some renown'd physician,
Before when all disorders vanish,
And baffled death himself "walks Spanish;"
But to disorder, can be worse
Than quick consumption of the purse—
Where patient poverty prevails,
The spual needs no other aids,
Whate'er some moralists may deem,
To make him wretched in th' extreme;
For awful agonies await
A mortally diseas'd estate.
But we assail this sore disease
With economic recipes,
Or like the Coan-age verbose
Prescriber fill many a godly deac
Of "aphorisms," which rarely fail
To cure the empty-pocket-aill.

There's likewise nothing truer than
That we are *Freedom's* Right Hand Man;
By Poverty, it paralyz'd.
A Commonwealth is soon capsiz'd;—
Suppose we Yankees were a set
Of paltry paupers, deep in debt,
Dreading, for lack of wherewithal
The wrong side of a prison-wall,
Pray tell us what we might regard
Our Liberty as worth per yard?

The wight in straighten'd circumstances,
Flagued and embarrassed in finances
Can hardly be much better than
A pitiful serving man.
And when the storms of Faction lower
Successive to every blast of Power.

That spruce old gentleman, so smart,
With "Eagle-eye," and "Lion-heart,"
Whom hardy have demi-defied,
Call'd Independence, wont abide
With ignorant, idle, shiftless chaps,
Poor living proofs of Adams's lapse.
He quaffs his cider, cracks his jokes
With good, stout, hardy, thriving folks,

But his sojourning will be brief
With those who can't get bread and beef.

To benefit our fellow men
We ply the press and push the pen.
For aye continually contriving
The ways and means to make them thriving.
Lest they become, as life advances,
The slaves of narrow circumstances,
A slavery little in arrears,
Of what men suffer in Algiers.

And sure 'twould seem no more than fair
That they who give should also share,
Of course your Honor will bestow
A trifle of the *quid pro quo*,
(*Anglice*) some remuneration
For all the useful information,
Drawn from the "Farmer's" ample stores,
We have presented at your doors.
And now, kind Sir, before we part
We wish you may, with all our heart,
Enjoy through this, and many a year
GOOD HEALTH, GOOD FRIENDS, GOOD LUCK, GOOD
Be blest in basket and in store, [CHEER
Till this life's transient scenes are o'er,
And in the next forevermore.

Boston January 1, 1828.

Simple contrivance for a purpose.—The inhabitants of Landes, in the south of France, being completely cut off from the rest of the world, have it not in their power, (except when once or twice a year they travel to the nearest towns with their wool,) to purchase cardles; and as they have no notion how these can be made, they substitute in their rooms a lamp fed with the turpentine extracted from the fir trees. The whole process is simple and primitive. To obtain this turpentine, they cut a hole in the tree, and fasten a dish in it to catch the sap as it oozes through, and as soon as the dish is filled, they put a wick of cotton into the midst of the liquor, and burn it as we do a lamp.

Such a contrivance might answer very well if placed in a chimney-way, or in some other thorough fare for smoke.

Large Hog.—Mr. Enoch Jones, (of Deerfield,) slaughtered a hog this season, eighteen months old, which weighed when dressed 716 pounds. *Portsmouth Journal.*

I look upon every man as a suicide from the moment he takes the dicebox desperately in his hand, and all that follows in his career from that fatal time is only sharpening the dagger before he strikes it to his heart.—*Cumberland.*

The Jews have a proverb, that he "who breeds not up his son to some occupation, makes him a thief," and the Arabians say, that an idle person is the devil's play fellow.

On examining the tongue of patients, physicians find out the diseases of the body, and prognostics the disease of the mind.

White Mustard Seed.

For sale at the office of the New England Farmer, the best English White Mustard seed, by the pound or bushel.

Lucerne Seed.

A few hundred pounds of fresh Lucerne seed, by the pound or hundred weight, for sale at the N. E. Farmer's office.

New England Farmer's Almanack, for 1828.—Just published, at the New England Farmer Office, and for sale by BOWLES & DRAPERSON, 72 Washington Street, and at the Book stores generally, the *New England Farmer's Almanack*, for 1828. By Thomas G. Fessenden, Editor of the New England Farmer.

The FARMER is published every Friday, at \$300 per annum, or \$250 if paid in advance.

NEW ENGLAND FARMER.

Published by JOHN B. RUSSELL, at No. 52 North Market Street, (over the Agricultural Warehouse).—THOMAS G. FESSENDEN, Editor.

BOSTON, FRIDAY, JANUARY 11, 1828.

No. 25.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

HORSES.

SIR.—There is no branch of rural economy more neglected in Massachusetts than horses. Why this should be the case I am ignorant; a colt can be bred nearly as cheaply as a steer; and is worth much more money when he is grown.—What a farmer can find to read upon this subject, if he desires it, must mislead him; most of it being taken from long exploded English treatises, and few men are to be found here, whose acquaintance with the subject is not exceedingly superficial, who are not of the less educated classes of the community. I have read an American Treatise, in which not only are the plates taken from an English one; but the author gives his readers a chapter upon chest-bounder; ascribing it to taking cold, &c.; a disease very well known at the present day to proceed from continual pain in the feet.

I wish to give you a few very short observations upon the most valuable breeds of horses; upon breeding them; the treatment of horses kept for their work; and the management of foot lameness.

Nature originally formed to herself, there is reason to suppose, two separate models of horse-flesh; though the different breeds of horses derived from accidental varieties and mixtures may be infinite. One she meant for daily drudgery in a northern climate; the other for speed, for violent occasional exertion, to gratify the pride and form one of the relaxations of luxury, and to live in the tropicks. The two horses are still to be found distinct; but most horseflesh is made up of their mixture.

The first is indigenous in the North of Europe. The basis of his colour is almost invariably black; though in some few of his varieties, he is either roan, or gray with most of his dark hairs red.—He is seen in Massachusetts perfectly pure in the Canadian; who has his fringe of hair starting directly from the knee; his shortness of breath; his willingness to draw; his sensibility to heat; and all the other attributes of the unadulterated cart horse. The gray horse, sent here by General Coffin, is a specimen of his English variety; but not of the very largest size. The true Canadian is a valuable horse, a foot endowed with very little sensibility, is very much inclined to carry flesh, and exceedingly well suited to a changeable climate; but he is unfit for fast work; and I question the fact from what I have seen, of his outworking the common Massachusetts horse at slow.

A remarkable degree of misinformation exists here as to the second; and, it may be well to give a very short description of him. In the countries where he has always been found, at least since the first dawn of history, he is about fourteen hands and an inch high, but pretty compact; the basis of his colour scarcely ever black; but generally, even if he is gray, some kind of red. He has a remarkably expressive eye, and very transparent; his nose nearly straight, and the nostril disengaged from the head; a most capacious chest; a

wide and elevated loin; carries the dock of his tail pointed straight to the end when he is in action; and has a round, high, and hard hoof. His purity has always been most sedulously preserved by the Asiatic Arabs. His bones are of a much denser texture than that of the cart horse; his skeleton is heavier in proportion to his apparent size; and he can stand under a heavier weight. His most distinguishing characteristic, however, is the natural clearness of his wind; and breeds of horses vary in this particular, according to the proportion they possess of his blood; or, as it is technically called, of "blood." This, with his muscular power, arises from the perfection of his organization; and he is often abused from the idea that he possesses a peculiar insensibility to fatigue, which none can thoroughly explain. His essence is speed. He is more inclined to save himself by flight from any thing he does not thoroughly understand; and is more irritable and variable in constitution. As he is probably indigenous in the sands of Arabia only, there appears no reason why his foot should have been made able to endure the concussion of a hard surface; and in some of his varieties, though the horn of it is generally excessively hard, the internal foot possesses extreme sensibility. He does not appear, under favorable circumstances, upon being transported to the climate of the cart-horse, to experience any diminution of his superiority to him, through any number of generations; though he is useless as he approaches that of the Arabian.

This most valuable variety, and that with which we are best acquainted, is the English thoroughbred horse; by which term is intended a horse, all of whose blood is to be traced to acknowledged racers, or to a very few celebrated individual horses, supposed to have been chiefly of Arabian blood, whose stock has in general proved so in England. Some of the pedigrees of this Anglo-Arabian have been regularly kept from the reign of James the first; but a very large part of him is derived from two individuals; one carried there about ninety years since, whose previous history is utterly unknown; the other, about one hundred and thirty years since, who was brought from the Desert of Palmyra. The blood of these two horses runs in the veins of the multitude of thoroughbred horses annually foaled in England, on the Continent, and in the United States; and excepting the genuine cart horse, there is scarcely a horse in England or the States entirely free from it.

The peculiar advantages and disadvantages of the thoroughbred horse, who is most corruptly called in Virginia the blooded horse, for blood-horse, are exceedingly necessary to be known to every breeder; as, though he is not so well adapted himself to any purpose but horse-racing, as a horse bred between him and one not thoroughbred, he is proved by the experience of a century in England, to be the only foundation of any reasonable expectation of breeding superior horse-flesh; allowed to be, and sought after from that cause by the Russians, the Germans and the French, who are all becoming great horse-breeders, and in most parts of the States, excepting in New England. As a proof of this last fact, I can

mention that Henry carried between two and three thousand dollars to his owners, in the vicinity of the city of New York, the last summer, as a breeder; and that he will probably this summer earn much more.

He (the thoroughbred horse) is subject to infinite variety; but he is generally accompanied by the following peculiarities. In wind, in muscular power, and particularly in being able to perform feats, he far surpasses any other horse; even the Arabian in his unimproved state. A case in point has occurred in which two Cossack horses, picked from their immense studs, were beaten in a 33 mile race, over a hard road near St. Petersburg, by a broken down English race-horse, and he also beats the best horses that can be bought in Arabia, in their own climate at Calcutta. All his work is performed in much less time, when the pace appears to the eye to be the same; he can be used at an early age—he possesses greater longevity—he suffers less from the heat, than a low-bred horse, but there his advantages cease.—His ancestor was termed merely for galloping—leaving all meaner business to the donkey and the mule; which, in his ancestor's climate, are noble animals—and from this cause, as well as from the peculiar manner in which he has himself been bred and treated, he is attended by two great disadvantages. He has, in the first place, been bred from a succession of horses selected for their superior galloping from a race of gallopers.

Excellence in this pace, which is, however, an equally accurate criterion of wind and muscular strength, is generally accompanied by a formation of the animal, unusual to excellence in any other; and a remarkable disinclination for exerting himself on any other than extraordinary occasions. To assist him in economising his powers, and to render them entirely subservient to the rapidity of his progression, he is formed, frequently to move his feet so short a distance above the earth, that, particularly in a slow walk, he is continually liable to have it meet with some obstruction, when it is bent backwards from the fetlock joint, and he is about to throw his weight upon it; the muscles of the bended limb not being under his command, he must occasionally lose his balance; and if it is his fore foot fall forwards; and if it is his hind foot, catch backwards; and, in confirmation of the last observation, many superior gallopers appear actually unable to use their muscles properly, when not in a state of violent exertion; have a slipping, thoughtless manner of going at all other times; and will not brace their muscles. In the second place, he has been in general confined in the stable, and shod previously to his being two years old; which gives to his hoof a totally different shape, in growing, by preventing its lateral extension; takes away much of the means of resisting concussion which nature intended it to have, by preventing the expansion of the back part of it when his weight is thrown upon it; and crowds the circulation of the sensible foot, by preventing the increase of size of the vascular parts after the excessive concussion to which the horse is daily subjected from that early age. Being also fed with the largest allowance of corn from before he is weaned, and the hoof

deprived, through most of his life, of the dampness of the earth, his foot is exposed to all the evils, increased by happening together, arising from a plethoric habit, from contraction of the horn, and from mechanical violence; and, an Arabian foot not being originally intended to meet with very severe concussion, a degree of pre-disposition to disease in the foot is propagated to each generation, particularly to caries of the bones;—which, (as the human teeth) are remarkably ready to discover an hereditary mis-organization. The thorough-bred horse has been long naturalized in the States; for, at least, half of the Massachusetts mongrel, and is found as common, and in as high perfection, as in England, in the low country of Virginia.

But the best horse, of any fixed breed, not thorough-bred, is the English Cleveland Bay;—of which the horse and mare sent here by Sir Isaac Jeffin, were intended as a sample. The true Cleveland Bay, who is probably a lineal descendant of the horse used for tournaments in the Middle Ages, is extremely scarce in England, and confined to the county of York. Though a much finer horse, and not over large, he bears a general resemblance to the German horse of the Middle States; particularly, in his full crest, his Roman nose, and his deep bay color. He is in the very highest request, both in England and on the Continent; and stands at the head of all breeds between the blood horse and the cart-horse. He has formed no part of the Massachusetts horse; but there is still remaining in England, some remnant of a very celebrated draught horse, who unquestionably has; many of our ancestors having come from his country, and his peculiarities are often to be traced in our horse. He was supposed to have been carried from Norway, and was called the Suffolk Scirel. He forms part of the modern trotting-horse of the bordering counties of Norfolk and Lincoln, of whom that most excellent horse Bell-founder is a genuine specimen.

The most valuable horse in himself, however, but who forms no breed, bred by the English, is their gentlemen's hunter. He is often supposed here to be the offspring of a direct cross between the blood-horse and the cart-horse. This has, in some instances, been the case; but he is usually, now, either the thorough-bred horse himself, or got by him out of a well bred mare; and it would be difficult to find one, of whom less than 3 parts in 4 could not be claimed by the Arabian. Some horses, not thorough-bred or as they are called in England, cock tails, are kept expressly as hunting stallions, but this is not common; the thorough-bred horse having the advantage of affording the greatest room for selection, and of having the peculiarities of his family so well known, as to give some grounds for a calculation concerning the fate of his stock. However, as he is sometimes kept entire, and as a wild good hunter must have shown himself able to perform the severest labor of which a horse is capable, and to possess, both, legs and constitution. I rather wonder none has ever been imported to this country as a stallion. In my next, I will make some observations upon the breeding of horses.

Fruit and Vegetables.—The neighborhood of London furnishes it with fruit and vegetables, and occupy about 6090 acres which are laid out in gardens, and give employment to 30,000 persons in winter, and nearly 100,000 in summer."

ADDRESS,

Delivered to the Proprietors of the first Agricultural, and third Social Library in Easton, Mass. December 18. By ROLAND HOWARD.

GENTLEMEN—I take it for granted that the most of you are already apprised of the object of this meeting—and if so, I beg that you will indulge me with a few moments of your attention, and a reasonable share of your candour, while I offer for your consideration some of the advantages, which, in my apprehension, may be derived from the establishment of a Social Library, selected with judgment, and managed with discretion and care; to be confined principally to subjects which relate to rural pursuits and domestic economy.

Whatever might have been the original condition in which man was placed, of one thing at least we are now certain; and that is, that the sustenance of man is only to be obtained by labor, and the sweat of the face; and that we are born into the world totally ignorant of the means most proper to be employed to obtain wherewith to satisfy our daily necessities; and thus we have not only our bread to procure, but we have to acquire the necessary knowledge how it can be produced—not is this condition, perhaps, much to be regretted, since so much of our happiness depends on the constant exertion of our physical and mental energies.

It appears from history that the employment given by the Supreme Being to some of the first men we have an account of, was as follows:—The first man was a dresser of vines and a cultivator of fruit trees; or in modern language he was a *Horticulturist*. The employment of the second was a tiller of the ground, or an *Agriculturist*. That of the third, a keeper of flocks, and herds of domesticated animals, or a *Shepherd*.

Then it appears that as soon as men were created, an employment was assigned them, suited in all respects to their physical powers, and well as adapted to supply their daily wants. In process of time men became multiplied, and it was found necessary that their employment should be still further varied, and adapted to all the necessities of a wide and extended population. Hence the origin of the Mechanic Arts—wide spread Commerce—and the complicated Machinery of the Manufacturer, which at this day give employment to millions of the human family, and incalculably serve to ameliorate our condition, and increase the means of subsistence.

It is not my present design to go into detail upon all the different employments of men, but the remarks which I have made were designed to show that however varied the employments of men may be, they are each necessary to the prosperity of the other; and that it is as necessary to the prosperity of the body Politic, that all its members are in a sound vigorous state, as it is that each member of the human body should be healthy, and capable of performing the various functions to which they are respectively intended. It is, that *Agriculture* and *Mechanics* give strength and support to *Commerce*; and *Commerce* in return, gives spring and support to *Agriculture* and *Mechanics*.

These remarks are believed to be correct and incontrovertible; and are made at this time, with the hope that they may tend to do away those jealousies that have prevailed, and are still believ-

ed to exist among us, between men of different occupations, and which have a manifest tendency to mar our general and individual prosperity.

Therefore if we wish to be *prosperous* in our several occupations, let us learn to think *liberally* and act *liberally* towards those who may be differently employed, provided their occupation may be a lawful one.

You will now permit me to revert to the first employment of our race, viz. Horticulture, Agriculture, and the rearing of domestic animals; and here permit me to observe, that these employments were not only *first* in the order of time, but they were, and still are, the first in order to existence.

In vain would the whitened canvass spread upon the wide bosom of the deep, if the hand of agricultural industry becomes palsied, and the earth should refuse to yield food for man and beast.—In vain would the wheels of our manufactures be put in motion, if the plough, the harrow, and hoe, together with the other implements of husbandry, are suffered to rust and decay, and the husbandman is found folding his arms in sleep at noon day.

Therefore, as it is from our mother earth that our race is to be upheld, and that too by the skill and energy of the agriculturist, it is but a reasonable inference, that the husbandman should avail himself of all the knowledge attainable, which may be likely to be useful to his profession.—When I speak of the agriculturist, I wish to be understood to include horticulture, and the care of domestic animals,—for notwithstanding they may appear to have been three distinct callings originally, they are now generally blended together; and the farmer or agriculturist, has to rear his own trees, and his own animals.

Agriculture is universally admitted to be an art, and if an art, why does it not need the same auxiliary aid and support as every other art?—The navigator has his books, his maps and his charts, and by a thorough knowledge of his profession, he is able to bring his ship safely into port, amidst the howling of the wind, and the thunders of the storm.

The manufacturer searches every book with a scrutinizing eye, wherein is recorded one particle of knowledge relating to his business; and cheerfully puts in practice every new discovery which has been tried and found useful.

Professional men also, universally consider books relating to their several professions as indispensably necessary—and why? It is because every material *fact*, they can there find recorded by those of the same profession, who have lived centuries before them; and thus they are able at one view to concentrate the experience and knowledge of all preceding ages.

Indeed, there is but one class of men with which I am acquainted that contemn and deride all experience and knowledge which relates to their calling, or profession, if it is not to them in a *book*, no matter how many well authenticated *facts* may be recorded—no matter how many who made successful discoveries, or how beneficial his results; if the facts or the discoveries are not in a *book*, they will not be *stark* taught.

Now, I beg to enquire, of this class? or may I presume that you are already apprised to what the remark will apply? For mine own honor, and for the honor of *the art* which I consider the *first* of all the arts, I will presume the latter, and proceed

to consider some of the objections which have been urged by those alluded to against the utility of books, as being promotive of their interest or happiness; and will endeavor to produce proof positive, that such reasoning (if indeed it can be called reasoning) is both fallacious and ruinous to all improvement.

If a farmer presumes to search the pages of any publication, which treats upon the subject of Agriculture, or domestic economy, he is sure to be stigmatized with the uncomplimentary epithets "book farmer," "gentleman farmer," "theoretical farmer," and the like:—and by some, it is roundly asserted that theory is altogether useless in agriculture; and that the knowledge acquired by individual experience and observation is the *only* knowledge to be relied on, or regarded. It is to be stated, however, that even such have been sometimes known to admit, that they have caught some new and useful ideas from the Calendar page of the "New England Farmer's Almanack," which has accidentally met their eye when looking for the day of the week, or month; and, having been found in an *Almanack*, surely must be entitled to some consideration—for the man who can make an *Almanack*, and foretell eclipses, and the full and change of the moon, must, to say the least, be endowed with an uncommon degree of wisdom and foresight; and consequently the hints, or facts recorded in the *Almanack* are entitled to a much greater degree of confidence and respect, than the same or similar facts merit if found recorded in any other book.

It is not my object to undervalue, or to set aside in the least degree, the knowledge which every individual may, and ought to acquire, by experience and observation. No—my object is rather to show that if we act wisely, we shall unite our own experience and observation with the experience, observation, and wisdom of past ages, so far as past experience has been tested, and found to have had a beneficial result—and to my apprehension there are but two methods by which this can be accomplished—the one is by tradition, and the other by record—and can it be possible that there are any among us so stupid as to not at once discover which of the two modes ought to have the preference? and which would be the least liable to abuse? I venture to say there are none. Nor do I believe there are any, who if they will dispassionately reflect, but that will admit the importance and advantage that may be derived in practical life, by consulting the oracles of past experience.

The object of this association is the improvement of its members in useful and practical knowledge, and to aid in diffusing it generally through the community.

To more readily effect this object, it is conceived that books treating upon Natural Philosophy, Chemistry, Agriculture, and Domestic Economy, to be owned in common by those who may see fit to associate for that purpose, must necessarily be of vast importance.

The knowledge obtained by a member of an association, established upon such principles, will be likely to be of a practical nature, and such as may be directly applied to the every day avocations and pursuits of those concerned; and will also furnish a strong inducement to read, and apply what they read to their present and future benefit.

It is believed that an association of this kind

will have a good moral tendency; which indeed is the most important consideration.

The morals of the rising generation most imperiously demand that something should be devised that will at once disply to their view, an object worthy their attention and pursuit, and thus by mixing amusement with instruction, raise in them a sufficient interest to divert their attention from places and practices calculated to fix upon them habits that will infallibly lead to their ruin. It has been said that "it is not frowns, nor is it arguments that will correct or pervert vicious practices: it is presenting a substitute, which is not *less interesting*, but *more useful*, that alone will prove an effectual bulwark against vicious habits in the young, and set them in a way that leads to usefulness, respectability, and happiness, in this and a future world."

That logic, ethicks, physic and metaphysics, should claim the dignity of liberal arts or sciences, excites no surprise;—but that the art of managing a farm, a house, and a family, should by so many be thought of little or no consequence, is indeed strange and wonderful.

Too many there are that imagine that reading, study thought or reflection, are of little or no use in the management of domestic concerns, and that it would be ridiculous to refer a housewife, or a husbandman to books to acquire a knowledge of their respective avocations.

But it is hoped, and believed, that the time is at hand, when those who are required to manage a farm and superintend the domestic concerns of a family, will clearly see the importance of acquiring the necessary knowledge to enable them to unite amusement with economy, and labor with profit and by well directed industry, and judicious economy, insure that respectability of character which preeminently belongs to that class of society who are the efficient supporters of all the others. Surely that science which directs our conduct, or enables us to reform our mistakes, is entitled to our peculiar regard; and though it be true that the wisdom obtained by experience, is the least fallible, yet it often costs so dearly that the intrinsic value scarcely compensates the price, and hence arises the advantage of uniting the experience of past ages with our own.

Perhaps it may be objected, that to become a member of an institution of this kind will *cost too much money*. To this it may be answered that in many cases it would be an actual *saving* of expense; for, as it would turn the attention of the members to subjects of general utility, it would consequently divert it from others which are more expensive, and less useful, if not pernicious—and we should consider that a few dollars appropriated to such a purpose, is by no means thrown away. I venture to assert that it will be a good *deposit* of money, not merely yielding 6 or 8 per cent but 50, 75, and 100 per cent. profit on your money thus judiciously appropriated.

Grape Vines—The quickest method of procuring grapes, is to graft into the body (near the ground,) or which is preferable, into the *roots* of large vines. In the following year, if the graft has taken, fruit will be produced. Thus every farmer who has wild vines growing on his grounds may, by procuring cuttings of hardy foreign or native kinds, and paying a little attention to the grafting and training, be soon and amply supplied with grapes for market or wine making.—*Eng. pa.*

An excellent trait in the French character.—It Cobbett's "Ride in France," is the following passage:—"I remark, as I go along, that the common people are very civil and obliging, whenever I ask them any questions about what I do not myself understand. There is nothing uncouth, nothing *boorish*, in their manners. They explain to you as well as they can, what you want to be made acquainted with; and when they do not instantly comprehend your meaning, they seem as anxious to anticipate it, as if you were not a *stranger*, but rather one to whom they have been used to talk. This is a great merit, and a mark of intelligence in the French people. It enables you to *get along* with them, which they cannot well do with us in England. A Frenchman is most completely out of his element in England, whilst an Englishman in France—(though the country may appear very strange at first) finds in the courtesy of the people a great deal to reconcile him to the strangeness of their customs.

A comparison between 1727 and 1827.—In the year 1727, hackney coaches were plain, awkward, clumsy things, with no springs, and their number did not exceed thirty-five in the whole of London: at present they are increased to twelve hundred. Fashions at that period did not reach any place fifty miles from London, until they were nearly out; now they travel down in coaches, diligences, &c. in a few hours. Coaches were then two days and two nights going to Dover; they now perform the same journey in about a quarter of the time. In 1727, meat was only three pence per pound; now it is ten pence or a shilling. Servants' wages then varied from two pounds to four; now, ten pounds to thirty.—*London Sun.*

Minerology.—We are happy to learn that Professor Cleveland of Brunswick College, is about publishing a third edition of his excellent treatise on minerology. It is the most copious work which we have upon this subject, and has been adopted as a text book by the professors of minerology in Yale, Cambridge, and we believe Amherst Colleges. He solicits from scientific gentlemen, generally, the communication of such facts concerning localities and peculiarities both mineralogical and geological, as may be within their reach, and of value in the new edition of his work.

Mammoth Pumpkin.—A Pumpkin, of unusual size, grew on the farm of John Reynolds, Esq. a few miles from Clarksburgh, Va. this season; it weighed 320 lbs. and measured round the middle 64 lbs. All that grew on the same vine weighed 84 lbs.

The child that is permitted to act habitually, from temper, is in the prospect of ungovernable passions and the swing of the gallowes, and its blood will be required at the hands of its imprudent parents, whose folly and wickedness are equalled, in magnitude, only by the momentous consequences, that ensue, and the awful responsibility which the parents incur. The greatest calamity that ever befall a child, is an indiscreet parent who knows nothing of family discipline.—*J. More.*

A shrewd observer once said, "that in walking the streets of a slippery morning, one might see where the good natured people lived, by the ashes thrown on the ice before their doors."

EXTRACTS

From an Address, to the *New York Horticultural Society*. By N. H. CARTER.

You need not be told, gentlemen, that no country opens so wide a field, and affords so many natural advantages, for improvements in horticulture, as the United States. Between the Alpine regions of the North, and the plains of the South, fanned by the breezes of the tropics—from the fir-clad hills of New England, to the orange-groves of Florida and Louisiana, we have almost every variety of climate, soil, and production. So boundless are the resources of our territory in these respects, that few indeed are the plants indigenous to other parts of the earth, which may not here find congenial localities, and be readily naturalized, by a very slight resort to artificial means. If I may be allowed to draw an illustration from the mixed character of our population, our soil and climate are as inviting to the exotics of other lands, as the freedom of our political institutions is to emigrants from foreign nations. We have room enough for both; and to both may the great Republic cheerfully open an asylum in its bosom, thereby augmenting its physical as well as its moral resources.

* * * * *

Horticulture considered as a practical and useful art, supplying the wants, conveniences, and comforts of life, forms a very prominent object of this association, to which its efforts have hitherto been chiefly directed, and which should never be lost sight of in our future transactions. Viewed in this light, it ceases to be an abstract and speculative pursuit, but comes home at once to the interests—to the business and bosoms of all classes of our fellow citizens. Comparatively few individuals in any community, however intelligent and enlightened it may be, find time amidst the more imperious cares, avocations, and duties of life, to make themselves familiar with the extensive and complex systems of botany. To the laboring classes especially, the volume of an intricate science is effectually closed:

"For knowledge to their eyes her ample page,

Rich with the spoils of time, did never unfold."

Chill penury repress'd their noble rage,

And froze the genial current of the soul."

But while only a small proportion of the community may feel disposed to encourage horticulture as a science, all are equally interested in its success as an art. The high and low, rich and poor, learned and illiterate, are concerned in having the markets and their own tables supplied with vegetables and fruits of a good quality, in sufficient quantities, and at moderate prices. Such results are alone to be produced by systematic and continued efforts. However genial may be our climate, or fertile our soil, the valuable products of the earth will not spring up spontaneously, nor flourish without culture. Well stocked as our markets now are, and much as they have been improved within a few years there is yet ample room for further advances in the variety, melioration, and abundance of the articles of daily consumption. * * * * *

It is worthy of remark, that we first find man, pure from the hands of his Creator, placed in a garden; as if such a retreat was most conducive to health, innocence, and happiness. Even the peculiar presence of the Deity himself hallowed the paradise he had made. His image there appeared "in the cool of the day." And may no

his footsteps still be traced in the garden—impressed on the dewy leaf and the opening flower? And is not his voice yet heard in the chorus of the woods, in the fall of the fountain, and the whispers of the breeze? * * *

The United States possess in abundance all the requisite elements for reaching the highest degree of excellence in this interesting department of the arts, comprising, as our territory does, an endless variety of surface and soil—picturesque hills—irriguous vales—bright waters—luxuriant woods, and unnumbered species of native plants; with a climate favorable to the cultivation of exotics. Indeed, nothing is wanting but the hand of taste, in seconding the profuse liberality of nature, to produce the happiest combination of rural scenery, and to render our landscapes and gardens among the first in the world. To the skies of Italy our country unites the verdure and fertility of England; and by a little attention, its external aspect may be made to rival either, in variety, richness, and beauty. Shall, then, these singular advantages be overlooked, or neglected? I trust, a very different sentiment prevails in the breast of every member of this association. Mere objects of taste, it is true, are of little importance, in comparison with the more useful and momentous concerns of life; but it should be remembered, that they form no inconsiderable item in the estimate of national character, as well as the sum of individual happiness.

Let it not be supposed, that I would limit the province of ornamental gardening to the walls of narrow enclosures—to flower-beds and parterres. On the contrary, its principles should be extended to the embellishment of the avenues, streets, and public squares of our cities; to the country-seats of the wealthy; to the fields of our farmers; and lastly, to the ultimate home of us all, churchyards and cemeteries. In some of these particulars, the example of the French is worthy of all imitation. To them, I believe, belongs not only the first idea of botanic gardens, but the more recent improvement of uniting such institutions with public promenades; or in other words, of combining science, taste, exercise, and amusement in one and the same establishment. Nearly every considerable town in France, has ornamented grounds of this description; and the plan has been extensively adopted in Great Britain. To the same nation is due the credit of having improved public cemeteries, by converting them into attractive instead of repulsive objects. A proper disposition of the dead, and a becoming tribute of respect to their ashes, by seeing that churchyards are neatly enclosed, shaded with ornamental trees and shrubs, with the addition of appropriate sepulchral monuments, should certainly not be subjects of indifference to the living. Wilson, the distinguished ornithologist, made a particular request, but a few hours before his death, that he might be buried in some rural spot, on the banks of the Schuykill, where the birds might sing over his grave. The sentiment was true to nature:—for, let philosophy preach as it may, our cares and anxieties, our feelings and affections, will extend to the unconscious dust. * * *

Unless some efficient measures be taken for the preservation and reproduction of timber, trees, and shrubbery, our country will ere long be as remarkable for its naked hills and arid plains, as it has been for its depth of woods and richness of foliage. Its beautiful forests have wasted away, like the

aborigines, who once made them their green and happy abodes. A war of extermination has been waged against both. To a certain extent, this was necessary, in the settlement of the new world. The advances of cultivation required, that the monarchs of the wilderness, moral as well as physical, should be hewn down by the axes of our hardy pioneers. But the necessity has now in a great measure ceased; and higher motives than those of taste should induce us to preserve the shattered remains both of the human and vegetable tribes. Justice and mercy plead in favour of the former; while policy and patriotism urge us to spare the latter. It is time to be frugal of the oak upon our hills, whence are to spring the fleets of a great nation; and to respect the pine, the still loftier lord of the forest, destined perhaps to bear the American Eagle upon its top across the seas, as it once bore the original of the emblem in its native vale, and to waft our future navies to new victories.

OPIUM.

The opium for commerce is the product of the common poppy, seen in gardens. Turkey opium was formerly deemed the best, but it has been cultivated for several years in England, of a purer and better quality, owing to the great care used in its preparation. The East India opium is inferior to the Turkey, from the leaves and stems of the plant being packed with the cakes, and often worked into the opium while in a soft state, probably to increase its weight.

English opium is generally in smaller cakes—cuts clear and smooth like liquorice, and is in a great measure destitute of stalks, leaves, and other impurities.

The consumption of this drug is almost incredible. It is an immense article of commerce, and an interesting paradox, from its extensive usefulness in modifying and alleviating the most painful diseases, while at the same time it is one of the most fatal poisons. In the year 1800, 46,808 lbs. were consumed in Europe; and the quantity has increased annually ever since.

The Bengal government derived a revenue of £594,978, from the sale of it in 1809, and the exports from Calcutta to China alone, in 1811, amounted to £567,871. The supply of Calcutta opium in 1827, is rated as follows:

Bengal, 6570 chests—Maba, 5000 do.—smuggled, 1500 do.—Turkey, 1000 do.—14070 chests.

Although this article is prohibited by the Chinese government, yet 2000 chests are annually sent to Canton, and about 40,000 pounds are imported every year to Canton.

The following method of cultivating it, is stated from recollection, but is believed to be substantially correct: The ground is dressed in the same manner as for a flower plot, and the seeds sown in rows, with room between for one person to walk through. When the flowers fall from the head, it is time to gather the juice. This is done by a person who goes in with a sharp instrument gauged to a proper depth, with which he scarifies the heads standing on the top of the stalks after the flowers have fallen. He proceeds through the field and returns by the next alley, scoring every head with one or more gashes. On arriving at the place from which he started, he retraces his steps, and collects the juice which has exuded, in a phial fitted with a sharp edged funnel-shaped tin tube, with the wide top of which he

takes it off the head. He thus obtains all from two rows in two successive circuits, when he pursues the same course with all the rows in the field. The next morning he goes over again, collecting what has flowed during the night, and making new gashes, until the heads cease to yield. The fresh juice is then exposed to the sun in shallow pans, and after the watery particles are evaporated, it is moistened with oil of poppy seeds, so as to be made up into cakes, when it is packed in chests, with alternate layers of poppy flower leaves. It is sometimes adulterated with an extract from the stalks and the gum of the mimosa. There can be no doubt that it might be profitably cultivated in the United States.

CHAMBERS' MEDICINE.

We have read with great satisfaction the "Reports of the Medical Society of the city of New York, on nostrums or secret remedies." The first article noticed is Chambers' Remedy for Intemperance. Drs. Hammersly, Drake, Manly, Watts, Ives, and Johnson, the highly respectable committee to whom this subject was referred, inform us, that they employed Dr. G. Chilton, an able and experienced chemist, to analyse the medicine, and that the results of his experiments show it to be composed of Tartar Emetic, Capsicum, Sulphur, Carbon, Cochineal and Gum. "If any doubts," say the committee, "could rest upon this result to which the analysis leads, it could not fail to be removed by the collateral evidences which may be brought in confirmation, from its exhibition both internally and externally—its effects upon the stomach and bowels are precisely those which ought to be expected from tartar emetic—and externally applied it will produce the pustular eruption, which is peculiar to this metallic salt." This medicine then owes any efficacy it may possess to the tartar emetic which it contains—of its value, therefore, as a remedy for intemperance—or the danger resulting in some cases from its exhibition we need not here speak. Every professional man will know how to estimate it.—*Am. Journ.*

If the above report be correct, it follows (says a correspondent) that any of our Medical men can furnish a remedy equally efficacious as this celebrated remedy, for five cents, instead of five dollars, the price which is paid for this.—*N. H. Register.*

MUSTARD.

There is a *white seeded* sort and a *brown seeded*. The *white* mustard is used in *salads* along with the *Cress* or *Pepper-Grass*, and is sown and cultivated in the same way. The *black* is that which table-mustard is made of.—It is sown in rows, two feet apart, early in the spring. The plants ought to be thinned to four or five inches apart. Good tillage between the rows. The seed will be ripe in July, and the stalks should be cut off, and when quite dry, the seed threshed out, and put by for use.—Why should any man that has a garden buy mustard? Why should he want the English to send him out, in a bottle, and sell him for a quarter of a dollar, less and worse mustard than he can raise in his garden for a penny? The English mustard is, in general, a thing *fabricated*, and is as false as the *glazed* and *pasted* goods, sent out by the fraudulent fabricators of Manchester. It is a composition of *baked bones* reduced to powder, some *wheat flour*, some *coloring*, and a *drug* of some kind that gives the pungent taste. Whoever uses that mustard freely will find a burning

in his side long after he has swallowed the mustard. Why should any man, who has a garden, buy this poisonous stuff? The mustard-seed ground in a little mustard mill is what he ought to use. He will have *bran* and all; and his mustard will not look yellow like the English composition; but, we do not object to Rye-bread on account of its *colour*! Ten pounds of seed will grow upon a perch of ground; and ten pounds of mustard is more than any man can want in a year. The plants do not occupy the ground more than fourteen weeks, and may be followed by another crop of any plant, and even of mustard if you like. This therefore, is a very useful plant, and ought to be cultivated by every farmer, and every man who has a garden.

Cobbett's American Gardener.

Effects of riding in consumption.—The cure I am going to mention, was of a gentleman who is related to the doctor, and is now living at Dorsetshire, who was brought so low by consumption that there seemed to be no possibility of a recovery either by medicine or exercise; but, it being too late for the first to do any good, all that was to be done was to be expected from the latter, though the doctor did not think that even riding would then do. However, the poor gentleman, seeing there was no other hopes left, was resolved to attempt to ride into the country; but was so extremely far gone, that, at his setting out of town he was forced to be held up on his horse by two porters; and when he got to Brentford or Hounslow, the people of the Inn into which he put were unwilling to receive him, as thinking he would die there, and they should have the trouble of a funeral. Notwithstanding, he persisted in his riding by small journeys to Exeter; and got so much strength by the way, that though one day his horse as he was drinking, laid down with him in the water, and he was forced to ride part of the day's journey in that wet condition, yet he sustained no harm by it, but came to the above mentioned place considerably recovered: when, thinking he had then gained his point, he neglected to ride any more for some time. But afterwards finding himself relapsing, he remembered the caution which Dr. Sydenham had given him, at his setting out, that if he should be so happy as to begin to recover, he should not leave off riding too soon; for he would infallibly relapse and die, if he did not carry on that measure long enough, so he betook himself to his horse again, and rode till he obtained a perfect recovery.

On hardening articles made of steel wire, without bending them.—This valuable process was employed by the late Mr. Rehe, of Shoe-lane, a most ingenious mechanic, in the following manner:

The articles having previously been carefully heated to the proper degree, instead of cooling them in water, Mr. Rehe threw them upon the flat surface of a fixed block of cast iron, and instantly rolled them round, by sliding another flat plate of iron over them: and thus, by this revolving motion, he kept them perfectly straight in the act of being cooled and hardened, between the metal plate and the block.

Sugar.—Under the domination of Buonaparte, France consumed only about fourteen millions of pounds of sugar annually. The present annual consumption exceeds 80 millions of pounds.—*Litt. Gazette.*

The town of Mansfield, in Connecticut has recently been several times noticed on account of its manufactures of silk. The Connecticut Register recently issued at Hartford, estimates the quantity produced at more than 3000 lbs. annually, and the value at \$20,000, which probably is not beyond the fact; but which is certainly a very considerable sum of money to be annually distributed as one item of income, among a population of 3000 inhabiting a comparatively unproductive soil; and that too without any expenditure for machinery or outfit of any kind. The process is entirely domestic, until the raw silk is adjusted into large skeins resembling the condition in which it is imported into England and other countries from the East. The further process into "sewing silk" is now to considerable extent performed by water power, at a small factory in the town of Lisbon, owned by an ingenious mechanic who invented the machinery during our late war with England, for the purpose of bringing into use the great quantities of raw silk of commerce, which had been captured by some of our privateers, and which from the singular manner in which it is put up, laid no small tax upon New England ingenuity.—We have seen lately a paragraph stating that a Frenchman had established a Ribbon manufactory in Windham, an adjoining town. The profitability of the culture of silk, may be estimated from the fact which we happen to know, that mulberry orchards of ten years' growth, and upon land otherwise of very little worth, are valued at \$200 an acre.

This town has been also somewhat known for its manufacture of Combs of various sorts, commenced at a very early period, and carried on to be sure at first by the slow process of sawing but one tooth after another, but now by the use of machinery, invented in this country, and with one half the material; the teeth of two combs being cut out at heads and points from each other, pursued with such expedition that a man is able to go through this process very neatly, at the rate of fifteen dozen in an hour.

Here it would also be wrong to omit to mention that Mansfield is entitled to the credit of having produced the invention of the Screw Auger, and this not so many years ago, but that some of our carpenters can well remember when the "Pod-Auger" (an instrument now or soon to be almost forgotten,) was their only dependence. The manufacture of this very useful instrument has also been a source of considerable profit. To all these might be added buttons, and several other articles, composing in the whole an extent of profitable business, which is fast transforming this town from one of the least productive (and perhaps from this very cause) to one of the most wealthy in that enterprising State.

Good humour is the clear blue sky of the soul, in which every star of talent will shine more clearly, and the sun of genius encounter no vapors in his passage. It is the most exquisite beauty of a fine face—a redeeming grace in a homely one. It is like the green in the landscape, harmonizing with every color, mellowing the glories of the bright, and softening the hue of the dark; or like a flute, in a full concert of instruments, a sound, not at first discovered by the ear, yet filling up the breaks in the concord with its deep melody.

AGRICULTURE IN GEORGIA.

The great importance of Agriculture, (in our eyes) and in those of every one we presume, who regards the vast extent and various productive capacity of our soil, has led us to notice every remark or hint which appears concerning it. The *Milledgeville* (Georgia) Journal, among a variety of other Reports, contains one on Agriculture and internal Improvement, from Mr. Bevan, on the part of the joint Committee on those subjects, to which was referred a certain resolution of the Georgia House of Representatives. We select some particulars from it.

The continued depression of the cotton market renders it necessary, says the Report, that Georgia should give her attention to the rearing of other articles, and to the improvement of that extensive alluvial region, known as "The Pine Barren Land," on which the present inhabitants glean a miserable existence. On the first settlement of the state in 1733, it was a condition annexed to every grant of land, that a certain number of the White Mulberry Tree should be reared on it.—The consequence was the production of a gradually increasing quantity of silk, which in 1759 amounted to 10,000 lbs. weight of cocoons, received at the old capital of the state. This branch of industry was destroyed by the occurrence of the Revolution, and the introduction of the more profitable, but unhealthy articles of rice and indigo. When it is recollected that the mulberry will grow in the most light sandy soil, and that the whole process of making silk may be carried on by adult females, and by children, its culture would seem to deserve attention. The olive has already succeeded in part. On the plantation of Thomas Spaulding, Esq. of McIntosh county, there are five bearing trees, and forty or fifty more which promise to be soon at maturity. The state is indebted to Thomas McCall, Esq. for his successful experiment of making wine from native grapes. As far back as 1740, good wine was made in Georgia. Indigo, tobacco, and sugar cane are, as every one knows, well adapted to her soil. There are several vegetable dyes besides indigo, which might be successfully cultivated. The most to be recommended is madder, long cultivated in Georgia, and known for its property of dyeing the Turkey red. It is suited to sandy loam, not retentive of moisture, requires light labor, and after three years, will bring a clear profit of one hundred and fifty dollars to the acre.—The white poppy, from which opium is made, is also well adapted to the climate. The rearing of natural and artificial grasses is dwelt on at some length. As they are extremely necessary in Georgia, especially in the dreary and monotonous region of the Pine barrens, which preponderate in Georgia,—so it is believed that the cultivation of the Bermuda grass would convert these into sheep-walks of great value. Lucerne and Bainton, and Red Baga and Mangel Wurt, &c. are likewise recommended.

It is proposed, therefore, to award Premiums for the best mode of counteracting Rot in Cotton; for the greatest quantity of Raw Silk, from worms bred in the state; for the greatest quantity of merchantable Olives, the produce of Georgia; of Wine, Sugar, Spruce, Tobacco, Opium, and valuable vegetable dyes; the most successful cultivator of grasses, and fattener of cattle; and for the most satisfactory method of improving the Pine Barrens.

The Report concludes with Swift's aphorism, that the man who causes two blades of grass or two stalks of corn, to grow from the soil, where only one grew before, is worth the whole race of politicians put together;—Than which same maxim it is difficult to imagine one less liberal or true or one that the worthy Dean himself was less likely to believe in his heart.—*Baltimore American.*

NEW ENGLAND FARMER.

BOSTON, FRIDAY, JAN. 11, 1828.

Practical hints for the management of bees. Take some opportunity in good weather to examine and supply as far as possible the necessities of your bees. If practicable, the hive should be turned up, and the stool well cleansed and ventilated.—Writers on this subject, tell us that the dysentery among bees, is caused more by the respiration of the foul air generated during the winter, than from any other cause; although it is certain, that it can be brought on by unwholesome and infected food.

The state of health of the bees, can in some degree be ascertained, by the symptoms of anger which they display on lifting up the hive. If a rustling noise be heard amongst them, and a sudden jerking of the wings, as if attempting to fly, it may be concluded that the community are in good health. The sound which issues from the hive immediately on raising it, is also a criterion by which to judge of the health of the bees. That of a diseased hive, partakes strongly of the smell of putrid objects, but not of an animal nature. That of a sound hive resembles the smell of a rind of wax, partaking, at the same time of the fragrance of honey. Mr. Howison states that the dysentery is one of the most common as well as fatal diseases of the bee; and that the mark of this disease is the excrement voided by the bee at the entrance of the hives, in spots, like linsced nearly black, and of an insupportable smell, and that this malady is contagious.

Mr. Howison considers this disease as incurable; although its prevention may be effected. "As soon, therefore, as I perceive any of my hives affected with it, I give them a little of the following composition, which has invariably checked the malady, when given in the early stages:

Rule. To a quart of white wine, add a pint of honey, and two pounds of loaf sugar; put the whole into a tin sauce-pan, and let it boil gently over a slow fire. Skimming it at different times, until it is reduced to the consistency of syrup. It may then be bottled, and put into the cellar, and kept cool for use. Whenever it is used, it must be gently heated, until it partakes of the consistency of honey."

The same author, in speaking of feeding bees, says, "there are two seasons in which the feeding of bees becomes necessary, and these are in winter and spring; at these seasons, the hives should be carefully watched, and when found light, an immediate supply be given them. It is best not to feed profusely, by giving a great quantity at a time, but gently, say about two pounds a month, and the feeding should be in the morning early—before the bees leave the hive, and always in pleasant weather; and that the entrance of the hive should be closed immediately after feeding, to prevent robbery from other hives. Or, it may be considered most prudent and safe to administer

food at evening, after sun-set, when the entrance of the hive need not be closed; but the vessel containing the honey must be removed before the next morning, to prevent robbery as before. Care should be taken, not to delay feeding your bees until their old store is all exhausted, for they will then become feeble, and if you preserve your bees you will lose much of their labor the next season. Sugar is sometimes administered as food for bees, as well as clear honey. Mr. Howison considers the first as improper food, and the latter as dangerous, and often exposing the bees to the dysentery; and adds, "whenever honey is given, it should be mixed with some good old white wine; it should then be placed on a slow fire, and stirred until the honey is all dissolved, then poured into a jar or other vessel for use."

"Dissolve one pound of sugar in a quart of good old ale, boil and skim it until it is clear, when cooled, it will have the consistence of honey, and may be given your bees. A little salt added to their food, is both safe and useful, especially when they are threatened with the dysentery. Molasses and water boiled, with a little salt, may be a good substitute."

In treating of the feeding of Bees, London observes that "Sugar simply dissolved in water (which is a common practice), and sugar boiled with water into a syrup, form compounds very differently suited for the winter store of bees.—When the former is wanted for their immediate nourishment, as in spring, it will answer equally well as a syrup; but if to be laid up as store, the heat of the hive quickly evaporating the water, leaves the sugar in dry crystals, not to be acted upon by the trunks of the bees. Lives may be killed with hunger, while some pounds weight of sugar remain in this state in their cells. The boiling of sugar into syrup forms a closer combination with the water, by which it is prevented from flying off, and a consistence resembling that of honey retained. Howison has had frequent experience of hives not containing a pound of honey, preserved in perfect health through the winter with sugar so prepared, when given in proper time, and in sufficient quantity."

Mr. A. S. Bugbee, of Northampton, has contrived a method of turning to account the natural activity of the common grey squirrel. "He has," says the Northampton Post, "a common cylindrical cage with wire bars, about three feet diameter, to the axis of which, (four feet long) are connected some small brass wheels which move the machinery of a coffee and pepper mill. Three squirrels are usually employed in the labor of this novel tread-mill, though we have seen a single one turn the wheel with apparent ease. The power of each squirrel in the wheel is estimated by Mr. B. at sixty five pounds, and in an hour they grind a pound of coffee, pepper, allspice, &c. The expense of the machine was about \$30, and the cost of the subsistence of each of the little laborers is about two cents a week.

vulgar error respecting the putting of Spirits into the Boots or Shoes to prevent the effects of cold.—The custom of pouring brandy into the boots or shoes, when the feet have got wet, with a view to prevent the effects of cold, is a practice which (though very common) is founded in prejudice and mis-conception, and often proves fatal, by bringing on inflammation, and consequent ob-

struction in the bowels. The practice is adopted, on the supposition, that, because spirits, when swallowed, excite an universal warmth, and cause a temporary increase of circulation in the extremities, they must do the same when applied to the extremities themselves. But the reverse happens. Fluids, when evaporating, produce cold; and the lighter and more spirituous the fluid, the more quickly it evaporates, and the greater the degree of cold generated. This may be proved by a very simple experiment. If one hand be wetted with spirit, and the other with water, and both be held up to dry in the air, the hand wetted with spirit will feel much colder than the other; or if the bulbs of two thermometers be so treated, the mercury will be observed to fall much more rapidly and extensively in one case than in the other. Whatever danger, therefore, arises from cold or damp feet, it is generally enhanced by the practice alluded to.

Usefulness of the wren in destroying insects.—As a devourer of pernicious insects, one of the most useful birds is the house-wren. This little bird seems peculiarly fond of the society of man, and it must be confessed that it is often protected by his interested care. It has long been a custom in many parts of the country, to fix a small box at the end of a long pole, in gardens about houses, &c., as a place for it to build in. In these boxes they build nests and hatch their young. When the young are hatched, the parent birds feed them with a variety of insects, particularly such as are injurious in gardens. An intelligent gentleman was at the trouble to observe the number of times a pair of these birds came from their box, and returned, with insects for their young. He found that they did this from forty to sixty times in an hour; and in one particular hour, the birds carried food to their young seventy-one times. In this business they were engaged the greatest part of the day, say twelve hours. Taking the medium, therefore, of fifty times in an hour, it appeared that a single pair of these birds took from the cabbage, salad, beans, peas, and other vegetables in the garden, at least six hundred insects in the course of one day. This calculation proceeds on the supposition, that the two birds took only a single insect each time. But it is highly probable they often took several at a time.

To prevent burrowing of rats in houses.—Rats may be effectually prevented from burrowing under the foundation of houses, by making an offset of stone or brick, about two feet in breadth, and eighteen inches below the surface; and by carrying up a perpendicular wall from the edge of this offset, to within a few inches of the surface of the ground. The adoption of the same plan inside, will prevent the burrowing of these animals in cellars; for rats always burrow close to a wall; and finding their perpendicular course impeded, they take a horizontal direction as far as the offset continues, when they are again stopped by the outside wall. Thus baffled, they ascend and go off.

To preserve Pumps from freezing.—Bore a small hole through the body of the pump beneath the surface of the ground, and above the upper bucket; the column of water above the upper bucket will then slowly leak out, and may also be raised again by a few strokes of the handle. In mild weather the hole may be plugged.

Dreadful accident.—At the execution of Levi Kelly, at Cooperstown, N. Y. for murder, a great concourse of people were assembled, about 2000 of whom were on a wooden platform, erected by the keeper of the hotel for the accommodation of spectators, and about an equal number were under the platform. As the prisoner was brought out, the crowd leaned forward to see him, and at this moment the platform gave way, and fell with all who were upon it, to the ground. In consequence of being forced forward horizontally, it fell upon a much smaller number of persons, than would have been buried under it, had it fallen directly, but from five to ten persons were killed, and several so severely wounded that it was thought that they could not survive. In the midst of the confusion caused by this accident the prisoner was executed.

On the benefit derived from frequently stirring the earth about growing vegetables.—Plants are very much benefited by having oxygen applied to their roots, being found to consume more than their own volume of that gas in twenty-four hours; and when applied by Mr. Hill, to the roots of melons, hyacinths, &c. the first were found to be improved in flavor, the second, in beauty and in vigor. Every thing that promotes the presentation of oxygen to the roots of plants, must be beneficial.

The Niagara Sentinel gives the dimensions, &c. of a tad of 18, named Darius Whitman, now on a visit at Lockport—viz. 6 feet 3 inches high, 4 feet 8 inches round the waist, and 298 pounds weight! He is said to be comparatively lank, having lately had an attack of the ague, which pulled him down considerably.

Great Income.—The beautiful domain of Moor Park in Hertfordshire, has just been purchased by the Earl of Grosvenor. What with his enormous estates in London and Westminster, in Chester, Cheshire, Flintshire and Denbighshire—at Shaftsbury, Hindon, Stockbridge, and numerous other places, the noble Earl may, perhaps, be considered the richest land owner in Great Britain. His income is estimated at from 270,000. to 300,000. per annum, which sum, immense as it is, is exceeded by that of the Marquis of Stafford, in a great measure derived from canal property. One only of Earl Grosvenor's mining concerns in Wales is let by him to a company for 20,000. per annum; and within the last 25 years he has laid out more than 700,000. at his family estate at Easton, near Chester.—Eng. Chronicle.

Transfusion of blood.—An English newspaper mentions a successful case of transfusion of blood from a healthy to a diseased patient. The latter was in a decline, and was one time in such a state of extreme exhaustion (from the loss of vital fluid.) that her friends felt confident that she was dead. A surgeon was sent for, who performed the very interesting operation of transfusion of blood from a healthy subject into the veins of the exhausted patient, so successfully, that she had so far recovered as to walk out of doors.—Hartford Mercury.

Asparagus, at \$4 a bunch of 100 heads, is advertised for sale by G. Thorburn & Son, New-York.

DIED in Easton, on the 3d inst. Lieutenant Jesse Howard, aged eighty-eight years. Mr Howard was distinguished for his active and patriotic exertions in those times which "tried men's souls."

Account Books, &c.

Just manufactured a complete assortment of *Account Books* made of the best materials and in the most approved modern style adapted to every capacity of business. *School Books, Bibles, &c.* Paper of 32 lbs; the greatest variety of *Stationery, &c.* to be found in the city, may be had at unusual low prices, at No. 96 & 98 State street, two doors east of Merchants Row, by JOHN MARSH.

J. M. is agent for P. Byrnes' Quill and Water Manicure New York. Also for Wm. Hoak's celebrated Medicine, and will supply all orders for their articles at their prices.

Jan. 4, 36.

Early Peas, Tree Onion, Poppy Seed, &c.

For sale at the New England Farmer office, fresh Seed of the Large Poppy, Early Peas, Tree Onion, White Clover, Lane &c. with the greatest variety of Seeds to be found in New England.

Seeds for Country Dealers.

Traders in the country, who may wish to keep an assortment of Garden Seeds for sale, are informed that they can be furnished at the New England Farmer office, No. 52 North Market street, Boston, with boxes containing a complete assortment of the seeds mostly used in a kitchen garden, on as favorable terms as they can be purchased in this country, neatly done up in small papers, at 6 and 12 cts each—warranted to be of the growth of 1837, and of the purest quality. ESSENTIAL FLOWER SEEDS will be added on the same terms, when ordered, as well as PEAS, BEANS, EARLY WHITE SWEET CORN, &c. of different sorts.

Lucerne Seed.

A few hundred pounds of fresh Lucerne seed, by the pound or hundred weight, for sale at the N. E. Farmer office.

PRICES OF COUNTRY PRODUCE.

MISCELLANIES.

FANCY IN NUBBUS

A SONNET COMPOSED ON THE SEA COAST

O! it is all-out with a heart at ease,
Just after sunset, or by moonlight skies,
To make the shifting clouds be what you please.
Or bid the eodly persuaded eyes
Own each strange likeness; sung from the mould
Of a friend's fancy; or with hand bowed low,
And cheek aslant o'er river's flow of gold
Twain crimson banks, and then a triad'er go
From mount to mount o'er Coast of ASD, gorge and land!
O! listen to the tale with closed eye tight.
Be that lhal'd bard, who on the Chian strand,
By those deep sounds possess'd with inward light,
Behold the Iliad and the Odyssey
Rise to the swelling of the voice sea!

S. T. COLERIDGE.

ANTIQUÉ POLTRY.

The following eccentric, but tender and touching lines are from the "EXAMINER" a poem on the death of his wife, by Dr Henry King, bishop of Chichester, Eng. in the reign of Charles I.

Sleep on, my love, in thy cold bed
Never to be disquinc'd!
My last good night! thou wilt not wake
Till I thy tale shall overtake;
Till age, or grief, or sickness numb
Mary my body to that dust
How much lovelier, and fill the room
Thy heart keeps empty in this tomb.
Stay for me here; I will not fade
To meet thee, ere at fallow vale,
And think not much of my delay;
I am already on the way,
And follow thee with all the speed
Desire can make or sorrow breed.
Each minute is a short degree,
Zit every hour a step towards the rest
At night when I betake to rest.
Next morn I'll be nearer my west
Of life almost by eight hours' sail.
Then when sleep's bro'ld o'er his drowsy eys

This from the Sun my bottom scars
And my dayes compass downward bears
No labor I to swim the tide
Through which to thee I swidly fly
This true, with shame and grief I yield
Thou like the vain fact took to the field
And gotten last the victory
In thus adventuring to dy
Pre're me, whoe more years might raise
A just proceed o're in the grave
But thank! my praise like a oak down
Beats my approach, till thee I come,
And slow bow ere my marches be
I shall at last at down by thee.

The thought of this led me to go on
And wot my dissolution
With hope and comfort, Dear, be gone
The crime I am content to live
Decided, but with had a heart,
Till we shall meet and ever part

Translated from Paris, Helogues de l'Espagne, l'Espagne, for the first time, &c.

ASYLUM OF AN OLD MOOR.

When Gibraltar was taken by Ferdinand 4th, he expelled the Moors. Among the fugitives was an old man, who, observing Ferdinand approach, and, leaning on his cane, thus addressed him: "King of Castile, what have I done to thee or thine? Your great grandfather Ferdinand drove me from Seville, my native country. I sought an asylum at Xeres: your grandfather Alphonso

made me leave this city. Taking refuge in the walls of Tariffe, your father Sancho assailed me there. Finally, I sought a grave in the extremities of Spain, on the shore of Gibraltar, and your fury has found me out even here. Point out to me the spot on earth where I may die undisturbed by a Spaniard.

LITERATURE OF THE MOORS.

A species of literature which was common among the Moors, and which the Spaniards have imitated from them is that of Romances and Novels. The Arabs were always and are still great story tellers. In the depths of the deserts of Asia and Africa, under the tents of the Bedouins, they collect together in groups to hear some love story. They will listen in silence and follow the reciter with interest, and show by their tears how deeply they are affected by the relation.

At Granada they joined to this natural taste for stories, a love for music and singing.

CHARACTER OF THE MOORS.

The defects in their character which were the cause of their ruin, were relieved by qualities which the Christians themselves could not but acknowledge. As brave and as cautious as the Spaniards, but less disciplined and less skillful, they were yet superior to them in the attack.—Adversity did not bend them down until they saw in it the will of heaven, and they then submitted without a murmur. The dogma of fatality contributed, no doubt, to give them this virtue. Religious observers of the laws of Mahomet, they practised with exactness the delightful law of charity: they gave to the poor, not casual bounty only, but a portion of their grain, fruit, flocks, and all their effects.

In the city and in the country the sick were sought out and attended with a most scrupulous piety.

Hospitality, always sacred among the Arabs, was not less so at Granada. Its exercise was to them no less a duty than a pleasure, and we cannot read without emotion the anecdote of an old man of Granada, to whom a stranger soiled with blood and pursued by justice, applied for shelter. The old man concealed him in his house. At the same time the guards arrived, bearing the dead body of his son, just murdered by the stranger, and demanded the murderer. The unfortunate father refused to give up his host; but when the guards had gone, he said to the assassin, "Flee from my house, for it will be permitted to me to assist you."

SHORT HAND METHOD OF CONVERTING THE MOORS.

When Granada capitulated, Ferdinand formally assured all the Moors who chose to remain, the free use of their worship. This treaty, however, was grossly violated. They were forced to abjure their faith upon their knees, by the most disgraceful means. Ferdinand himself administered baptism, sword in hand, to more than fifty thousand of the vanquished.

The sketch of propriety reported in the paper, of a land in a round Paris, consists in vineyards, or in gardens full of various sorts of vegetables for the market of Paris, and walled gardens, for the cultivation of peach, apricot, netarine, and plums. There are very few fine woods made use of, besides the walls, which are built for the trees to

grow against; and many of these walls, though close to so large a place as Paris, are built quite in the open ground, at a distance from any house, not enclosing a piece of ground, but merely one line of wall; so that, if the people passing were inclined to steal the fine fruit that grows in this way they might, without hindrance: nevertheless, the gardeners (who garden for profit) do not find any reason to apprehend such depredation.

From original Papers in the British Museum, first published in the Monthly Review:

"Rates of Laborers' and Hierers' wages, appointed at the General Sessions for the peace, within the City of Chester. Anno. 38, R. Elizabethæ."

Table with 3 columns: Wages by the day, with meat and drink; Wages by the year, without meat and drink; Wages by the week, with meat and drink. Lists professions like Smith, Wheelwright, Plasterer, Bricklayer, Slater, Cowper, [Cooper], Tanner, Pewterers, Master Carpenter, Bayliff of Husbandry, Miller, Baker, Fletchers.

Hartian Mss. 2091.

When instead of the witnesses or the clients of each other, gentlemen of the bar pour their wit, or their abuse upon their own fraternity, the spectacle from without the bar is deemed not only amusing but appropriate. The following ludicrous scene of this sort is said to have lately taken place in our Marine Court, between two gentlemen of the bar—the one rather fat and the other rather small:—

Brother Fat.—(to the court) I don't care what Mr. — says: he is only a moschetto, and I don't mind their stings.

Brother Small.—I beg your pardon, Mr. —: but it is a fact in natural history, that moschetos never sting hogs.

Brother Fat.—Is it so, sir. —: then you had better inform your acquaintances of it: they'll be glad to hear it.

Brother Small.—Allow me, then, Mr. —, to communicate it to you among the last.

Here the court, amid a roar of laughter, called the gentlemen to order.—N. Y. Adver.

White Mus and Seed. For sale at the office of the New England Farmer, the best English White Mus, and seed, by the bush.

Sharon Seed. Just received of the celebrated J. P. White, Farmer, also J. Silberman, Paris, &c. The most improved variety lately obtained, one ear of 12 bushels, and another of 15, the best sort to sow with grass, as it is the most productive. The New England Farmer, as well as his country friends, the New England Farmer, are well supplied with the same. The Seed was originally procured from Paris a few years since, by a gentleman in the city of New York.

Dutch Potatoes Roots. Just received of the office of the New England Farmer, admirably adapted for the double and single Dutch combs. They are, besides, Tuberoses, Jerusalem Tubers, Turneps, Hampeuses, &c. Also, also POTATO ONIONS—with every variety of Good Seeds, &c.

NEW ENGLAND FARMER.

AGRICULTURE.

FOR THE NEW ENGLAND FARMER.

ESSEX AGRICULTURAL SOCIETY.

REPORT NO. I.

The Committee on Swine, having attended to the service assigned them, ask leave to report—that the Swine exhibited, so far as they are able to decide, were equal, if not superior to those of preceding years.

After a careful examination of the various kinds presented, your Committee have awarded premiums as follows, viz.

To Henry Mowatt, of Newburyport, for the best boar, \$5.

To Thomas Emery, of Newbury, for the next best boar, \$3.

To William Thurlow, of West Newbury, for the best breeding sow, \$5.

To William Thurlow, of West Newbury, for the best litter of weaned pigs, six in number, \$10.

To Richard Heath, of West Newbury, for the next best litter of weaned pigs, four in number, \$7.

To Enoch Noyes, Jr. of West Newbury, for the next best litter of weaned pigs, four in number, \$5.

The black pigs exhibited by Moses Noyes, of West Newbury, were very good; had they been white, it is the opinion of your Committee, that their value would have been enhanced, as those usually obtain a preference in market.

The fat hog of William Thurlow was very fine. In rearing swine, as well as in other branches of husbandry, Mr Thurlow has manifested a desire to excel, which is truly commendable; and it is believed that in preparing them for an early market, the farmers of Essex, will find his example worthy of imitation.

All of which is respectfully submitted,

PAUL KENT,

JESSE KIMBALL, } Committee.

MOSES NEWELL, }

REPORT NO. II.

The Committee appointed by the Trustees of the Essex Agricultural Society to examine, and report on the qualities of Animals exhibited, Octo-ber 10, 1827, have attended to the duties assigned them, and respectfully offer the following report, to wit.

The Committee first examined all the animals exhibited for premiums, and are happy to state to the society that the number offered is unusually large, compared with the number of any former year. The number, appearance, and general characteristics of the animals were extremely pleasing to the Committee. The claims for premiums among the several competitors were, in many instances, so nearly equal, that the Committee were at a loss on whom to bestow the first premium. But on careful examination, the Committee have awarded to Nathaniel Kelly, of Salem, the first premium of \$15 for his half blooded bull 20 months old.

To Moses Coleman, of Newbury, the second premium of \$10 for his half blooded bull 20 months old.

To Jedediah H. Barker, of Andover, for his bull

20 months old, of native breed, a premium of \$15.

To Richard Heath, of West Newbury, for his bull 18 months old, of native breed \$10.

The above premiums are awarded on condition, that the animals shall be kept for use within the county, at least 22 months next succeeding the exhibition, of which satisfactory assurance in each case, shall be given to the Secretary, previously to receiving the premium.

The Committee have awarded to Enoch Noyes, Jr. of West Newbury, a premium of \$15, for his milch cow.

To Jonathan Chase, of West Newbury, \$10, for his milch cow.

To Samuel Shaw, of Newburyport, for his milch cow, \$5.

To John Torrey, of Newbury, \$10, for his heifer or 2½ years old.

To David Evans, of Newburyport, for his heifer, \$5.

To Moses Newell, of West Newbury for his four year old steers, \$10.

To John Rea, of Topsfield, for his four year old steers, \$10.

The Committee recommend to the Society to grant the following gratuities, there being no more premiums at the disposal of the Committee, to wit.

To Moses Newell, of West Newbury, \$5 for his two year old steers.

To George Adams, of Newbury, \$5, for his two steers.

To Jedediah H. Barker, of Andover, \$5, for his 3 year old steers.

To William McKinstry, of West Newbury, \$5 for his two heifers, about 20 months old.

To George Thurlow, of Newbury, \$8, for his Merino sheep, five in number—the dam and two pair of twin ewes; one pair two and the other three years old, all full blooded.

In addition to the foregoing animals, there were many others of excellent appearance offered for premiums, which do much credit to the owners. The number of working oxen and milch cows exhibited for show, of the former over thirty pair in one team, and of the latter more than one hundred in one enclosure, all owned in West Newbury, gave the proudest specimen of the zeal and devotedness of the farmers of that town, ever witnessed in this county on any similar occasion.

It appears to your Committee, that the progress of improvement in horned cattle, from year to year, promises much good to the community and does great credit to the farmers of Essex; and they anticipate that a continuance of the same laudable exertions, which have this day been witnessed, will, in a few years, place our neat cattle on a par with those in any other county in the commonwealth. The Committee are aware that counties in the interior of the commonwealth possess innumerable advantages over us, on account of the luxuriance of their pasturage, but this deficit can, in a great degree, be supplied by the use of green crops and other auxiliaries, which most farmers can have always at hand.

Respectfully submitted,

J. GARDNER, per order.

West Newbury, Oct. 10, 1827.

REPORT NO. III.

The Committee on Domestic Manufactures respectfully report,

That they derive peculiar satisfaction in observing the regular progressive improvement, which is making in the county. The articles manufactured this year, and entered for Premiums, as displayed for exhibition, greatly exceed in number, value, and excellence of fabric, those produced in any former year since the establishment of the Agricultural Society—evinencing the advantage and propriety of the Society's bestowing premiums. Situated as this country is, relative to her commercial connections with the old world, it is highly gratifying to our American feelings, to perceive that we are advancing in manufactures and the mechanic arts with hasty strides. It is to us a proud consideration that the time is not far distant, when the premiums upon all useful articles of manufacture, and upon many which are merely ornamental, will be paid to our artists and fair country women, instead of going to the support of the "work shops" of Europe.

Among a great number and variety of articles all of which were highly creditable to the makers, they have selected the following for premiums.

The Committee have awarded the 1st premium for 30 yards of Carpeting (Venetian one yard wide, to Richard Jaques, of Newbury, made in his factory, of very superior manufacture. The actual cost of which does not exceed one half the price of that imported, of the same quality, \$10.

To Mrs Hannah Abbot, of Andover, for 26 yards of stout and durable Carpeting; but not so fine as the preceding, \$5.

To Miss Rebecca Greenough, of Bradford, for 24 yards of handsome Rag Carpeting—made by hand, 4 yards wide, and without seam, a gratuity of \$3.

To Mrs M. Tappan, of Newbury, for a beautiful Hearth Rug, wove in a common loom, without the aid of the needle, and in a quarter of the time required to make such in the usual way, \$4.

To Miss M. Locke, of Andover, for a Rug of braided tags, very pretty, \$2.

To Miss Mary Cook, for a Rug, 2d premium \$3.

To Miss Abigail Dorr, of Salisbury, for two Rugs, 3d premium \$2.

To Miss Margaret B. Bartlett, of Newburyport, for the best wrought Counterpane, said to be done before she was 9 years of age, \$4.

To Mrs Phebe Ballard, for one wove with a handsome border, 2d premium \$2.

To Miss Charlotte Gilman, of Newburyport, for figured do, \$2.

To Miss Abigail Gragg, of Boxford, for beautiful Linen Diaper, Table Cloths and Towels. She showed some fine woollen gloves also, \$3.

To Miss Jaques, daughter of Richard Jaques, of Newbury, for an excellent worked White Lace Veil, \$2.

To Miss Hannah Abbot, of Andover, for a Hat, manufactured by her, containing 876 strands, in only 3 days, \$5.

To Uriah Bailey, of Newbury, for 3 doz. Combs, Horn and Shell, of superior manufacture, \$2.

To James Field, of West Newbury, for the best pair of boots, \$2.

To William N. Chase, of Bradford, for one pair thick pegged shoes, \$1.

To Miss Mary Stevens of East Bradford, for a box of 1 dozen of wreaths, and 1 dozen flowers, beautifully wrought, \$1.

To Andrew Dorr, of Danvers, for 22 sides of the best tanned sole leather, done in the usual method, \$10.

To John Osgood, of West Newbury, for 13 sides lo. 2d premium, \$5.

Numerous spectators as well as the Committee were much gratified with the numerous appearance of a great variety of articles, useful and ornamental, displayed for exhibition. The following were particularly thought deserving of commendation.

Twenty-eight yards of carpeting exhibited by Dorcas Abbot, of Andover, made with her own hands, at the age of 70 years.

Mary Foster, of Buxford, presented 20 yards of carpeting for inspection. Sarah P. Newman, of Andover, the same. Also carpeting by Mr Abraham Dow. Miss Hannah Gage, of Rowley, a hearth rug, composed of more than 12,000 pieces of the size of a cent, ingeniously executed. Mrs Harris, a rug & cricket covering, much admired.

Mrs M. Winkley, of Amesbury, a handsome rug wrought with the needle. Miss Parker, of West Newbury, a rug. Timothy Kenniston, of Haverhill, a rug. Sarah Somerley, of Newburyport, a rug, admired for its beauty and cheapness.

Counterpanes—Miss Valeria Plummer, of West Newbury, one wrought before she was 5 years old. Miss Rebecca Stanwood, of West Newbury, a patch, of much merit. Mary Stanwood, of Newburyport, a white figured do. wrought with the needle, a beautiful specimen of industry and ingenuity. Miss Thurlow, daughter of William Thurlow, of West Newbury, one completed before she was three and a half years old. Richard Adams, Jr. of do. exhibited 23 yards plain blue wollen cloth, very handsome, but not wide enough for a premium.

The venerable Mrs Spofford, of Bradford, 85 years old, showed of her own working, a handsome cushion cover, herring bone stitch.

Catharine P. Griffin, some elegantly worked lace. Elizabeth Cook, of Newburyport, a black lace veil of her own working.

John P. Webber, of Beverly, a box containing 2 dozen canisters of domestic mustard, which appeared to be very nice. Anson W. Noyes, of West Newbury, presented a parcel of side combs of the finest polish. John B. Noyes, of do. 1 doz. do. finely manufactured.

Samuel Henderson exhibited one pair thin shoes and 1 do boots, done in handsome style.

Miss Caroline Lunt, of Newburyport, 1 box fur trimmings, beautifully wrought. Lydia T. McKinsiey, of West Newbury, aged 9 years, and her sister Elizabeth aged 8, showed each a sampler, fine evidences of infant ingenuity and commendable industry.

The Committee have with much pleasure attended to the duties assigned them. And in conclusion they cannot omit to express a wish that no numbers of useful and ornamental articles exhibited, may continue annually to increase in the same ratio as heretofore. All of which is respectfully submitted. BENJAMIN PARKER,

Chairman of the Committee.

MASSACHUSETTS AGRICULTURAL SOCIETY

The Committee on Agricultural Experiments, have carefully examined the communications received by the Secretary, since their report in October last, from the several competitors for premiums offered by the Trustees; and ask leave to submit for their consideration the following additional report, to wit.

That Mr Nathan Groat, of Sherburne, in the county of Middlesex, is entitled to the premium of twenty dollars, for having raised, the present year, the greatest quantity of barley, being fifty-four bushels on an acre. Mr Groat in his communication states as follows. "The soil is a dark rich loam, quite level, and naturally moist—in 1825, it was planted with Indian corn; about twenty loads of barn yard manure were so spread over the land, and the residue put into the hills; the corn was hoed three times, and produced about forty bushels. Last spring it was ploughed as early as the ground would permit. There were then eight loads of barn yard manure spread upon the acre, and ploughed in. This ploughing was about eight or nine inches deep, being considerably deeper than I have been in the habit of ploughing my lands—it was then ploughed the third time with a horse plough. About 52 quarts of seed were sown upon the furrows, and harrowed in; it was harvested in July, and the product was 54 bushels of well cleaned, sound barley.—The quantity of seed was less than is usually sowed; but I am of the opinion that the crop would not have been increased by an additional quantity of seed. I attribute this unusual crop, in some considerable degree, to the pains that were taken to prepare the land in the best manner; and I am fully convinced that farmers in general would promote their interest, by bestowing more labor in preparing their tillage land for crops. The expense of cultivation, estimating labour at seventy-five cents per day, amounted to twenty dollars and sixty-one cents." Mr Richard Adams, Jr. of Newbury, exhibited satisfactory evidence of his having raised the present year, fifty bushels of barley on an acre.

That Payson Williams, Esq. of Fitchburgh, in the county of Worcester, is entitled to the premium of twenty dollars, for having raised the greatest quantity of potatoes on one acre; being five hundred and eighty-two bushels. Mr Williams' statement is as follows: "As a claimant for your premium for the greatest quantity of potatoes produced from one acre the current year, I would state that my crop of 582 bushels of potatoes on the acre was grown the present season, on the same field which produced 550 bushels o the acre in 1826; as a statement of that crop, mode of culture, and kind of soil, was then before you, and can now be referred to, it will therefore be unnecessary to enter into such detail at this time.—The first part of last May forty-four cart loads of unfermented manure, principally from the sheep fold, were evenly spread, and immediately ploughed in, 9 inches in depth, my practice for the last five years. The ground was then furrowed each way about 3 feet apart, and 5 cuttings placed at the intersections of the furrows, which were shallow. The quantity of seed was forty bushels, mostly the reds of La Plata. The planting was finished the 15th of May; the weeding was performed with the horse harrow, and hand hoe, so soon as the plants were about one inch above the

ground. The second and last dressing was performed by furrowing between the rows each way, with the horse plough, and dressing down the hills with a hand hoe; at this time the vines were 9 inches high, and beginning to bud—as the vines in a short time from the last hoeing, covered the ground, no other attention was necessary excepting occasionally pulling a few scattering weeds, till the crop was harvested, which was completed about the middle of October.—The expense of culture, estimating labour at sixty cents per day, and including the value of the manure used, was fifty-four dollars and sixty cents." Mr Leonard Hill, of East Bridgewater, raised the present year, on one acre and eight rods, 543 bushels of potatoes. Your Committee regret there not being a second premium offered by the Trustees, for the greatest quantity of potatoes over 500 bushels to the acre; they would most cheerfully have awarded the same to Mr Hill, as a remuneration, in part, for his very laudable exertions.

Mr Nathaniel Holden, of Shirley, in the county of Middlesex, raised 98 bushels of Indian corn, on one acre. The following is Mr Holden's statement: "The quality of the land is a yellow loam. In 1826, about two thirds of the land was cultivated with Indian corn in rows, and manured at the rate of 20 loads to the acre, and the crop was large. In the autumn, in addition to this piece of land, one third of an acre of grass ground was ploughed, making in the whole one acre. In the spring of 1827, I split the hills, and carried on 12 cart loads of barn manure, spread & cross ploughed the whole, the ground was then furrowed by turning two back furrows about two feet apart; a space of four feet was then left for the plough to pass. In these furrows were put 17 cart loads of manure, consisting of meadow mud, barn yard, hog yard, and green manure. It was planted about the 20th day of May. Four kernels of corn were put in the hills about twenty inches apart, taking care not to have the hills opposite to each other. The seed was the Brighton 12 rowed yellow corn; it was three times ploughed and hoed; the corn was harvested about the middle of October, and spread on a corn chamber floor, it was weighed the 13th day of December; the whole weight found to be 735½ lbs. At this time 7½ lbs. of ears made one bushel of shelled corn, making in the whole 102 bushels 3 pecks and 1 quart of shelled corn, weighing 58 lbs. to the bushel. The expense of cultivation, including the value of the manure, was twenty-seven dollars and eighty cents." The Trustees having determined, as will be seen by their list of premiums published in January of the last year to consider seventy-five pounds of corn and cob as equivalent to one bushel of shelled corn, the quantity raised by Mr. Holden was only 98 bushels and 1-75 part of a bushel; and of course not entitled to the Society's premium.

Mr Josiah Bass, of Quincy, raised the past season, thirty-one bushels and one peck of winter rye, weighing fifty-nine pounds to the bushel, on one acre and thirty rods. And Mr John Boynton, of Somerset in the county of Bristol, raised 57½ bushels of oats on one acre and sixteen rods.—No premium has hitherto been offered by the Trustees for the raising of oats.

No claims were exhibited to your Committee for the premiums offered for the greatest quantity of wheat raised on one acre; nor for the greatest quantity of millet, carrots, beets, parsnips, mangel

wurtzel, ruta бага, turnips, onions, cabbages, peas, & beans—nor for the greatest quantity of vegetables (grain, peas and beans excepted) raised for winter consumption, and not for sale—nor for the most effectual mode of extirpating the worm that attacks the locust tree—nor for a mode, hitherto unknown, to extirpate the borer that attacks the apple tree, which shall appear to the Trustees to be effectual, and cheaper than any mode now in use. The best mode for rearing, feeding, and fattening neat cattle—the utility, and comparative value of cobs of Indian corn, when used with or without the grain itself, ground or broken—nor for the greatest quantity of butter and cheese, made between the 15th day of May, and the 1st day of October, from not less than four cows; the quantity of butter and cheese and the number of cows to be taken into consideration. The past season having been so uncommonly propitious to vegetation, strong hopes were entertained by your Committee, that our brother farmers would by their experiments in agriculture, have made more numerous claims for the premiums offered by the Trustees. All which is respectfully submitted.

By order of the Committee,

THOS. L. WINTHROP, Chairman.

Boston, Jan. 12th, 1825.

Food of the French.—Of the food of the French peasant, bread is a principal article; and it is in France, as it appears natural that it should be, the most abundant article in the way of food. All sorts of vegetables in this country give way to bread. A less quantity of meat is requisite to a French laborer, than what laborers (when they can get it) are used to consume in England. The economy in cooking in France is such, that the same quantity of animal food which we eat in England, would feed almost double the number of persons in France. Soup is a food of which the French are so fond, that they can scarcely bear to go without it. The best soup they like best; but they like soup in general, so much, that even soup maigre is better to them than no soup at all. The French do not cook so much meat in large pieces as we do; they cut it up into small bits, and stew or fricassee it, most frequently. It is this mode of cooking among them, no doubt, which has led to the supposition, which I do not think well founded, that the French are more abstinent with regard to meat than we are.—*Cobbett's Ride in France.*

Venom of the Rattle Snake.—A gentleman of this city some time last summer extracted the teeth of a Rattlesnake, and about three months afterwards he accidentally with the same knife used on that occasion, and which had ever since that time been standing against the side of the kitchen, wounded his leg slightly. In a short time the wound put on all the symptoms of the bite of a Rattlesnake, and remedies were applied accordingly which fortunately proved successful.

3d. Brit. Com. Reg.

To make a York-hire Pudding.—Take a quart of milk, four eggs, and a little salt, make it up in a thick batter with flour, like pancake batter.—Have a good piece of meat at the fire; take a stewpan, and put some dripping in, set it on the fire; when it boils, pour in the pudding; let it bake on the fire till you think it is high enough, then turn a plate upside down in the dripping pan, that the dripping may not be blacked: set the

stewpan on it, cover the meat, and let the dripping drop on the pudding, and the heat of the fire come to it, to make it of a fine brown. When the meat is done and sent to table, drain the fat from the pudding, and set it on the fire to dry a little; then slide as dry as you can in a dish; melt butter and pour it in a cup, and set in the middle of the pudding; the gravy of the meat eats well with it.

Vital Principles of Seeds.—A small portion of the Royal Park of Busby was broken up some time ago, for the purpose of ornamental culture, when immediately several flowers sprang up, of the kinds which are ordinarily cultivated in gardens; this led to an investigation, and it was ascertained that this identical plot had been used as a garden not later than the time of Oliver Cromwell, more than one hundred and fifty years before. (*Monthly Magazine*)

From London's Gardener's Magazine.

The Seeds of *Tebagoia expansa* (New Zealand Spinach) were sown in the open garden at Yarmouth last autumn, and have produced fine plants this spring; by which it appears that this plant will endure our winters in mild situations.

The Red Spider and the Damp, the one as bad as the other, in melon frames, may be kept under by covering the surface with clean gravel, about three fourths of an inch deep. The roots find their way to the surface of the mould, and form a matted texture under the gravel, where, being more accessible to air, and yet kept moist, the plants grow so vigorously as to overcome every enemy. The practice is common in this neighbourhood.—*James Stephens, Gardener in George Leake's, Esq., Carr House, near Bancastr.*

Tart Rhubarb, Turnip tops, Beet Spinach, Asparagus, and various other stalks and leaves produced from bulbous, tuberous, or fleshy roots, may be grown in barrels or hampers, in ships; and nothing can be easier than to have new potatoes and mushrooms in a ship's hold all the year. Spinach barrels should be kept on deck, and covered with a glass case to protect them from the sea spray. Small salads may be grown in twenty ways.—*A Horticultural Sailor. Greenwich Sept. 23.*

The quickest and most certain Mode of raising the Mulberry Tree is from cuttings of the old branches. Take a branch in the month of March, eight or nine feet in length, plant it half its length in any good soil, and it will succeed to admiration, producing fruit the following spring. This I have witnessed in several instances.

Roots of the Arracacha have been received by Dr Hamilton, from Carthage, packed in powdered charcoal; they have been planted in the nursery of Mr. Pontey at Plymouth, and are doing well. The native situation, soil and climate of the Arracacha are very similar to those of the potato. (*Plym. Jour., Aug.*) A second notice of September 23d informs us that two plants of Arracacha are now nearly in flower at Mr. Pontey's and that too which Dr. Hamilton retained for private experiment, as to their capability, without any artificial aid; of course their progress has not been so rapid as that of a plant plunged in Mr. Pontey's tan-pit. Their state of growth, however, is such as to promise favourably for the important experiment of acclimating this valuable esculent next year.

Apples marked with the impression of a leaf are sold in the bazars of Persia. To produce this impression, a leaf of some flower or shrub is glued or fastened with a thread on several parts of the fruit, while yet growing: the apple gradually ripens, and all that the sun reaches becomes red; the parts covered with leaves remaining of a pale green or yellow colour.

A very large American gourd, weighing 66 lbs. was lately exhibited from Antherston, some white plums from Castle Huntly, and a number of fine seedling pinks from Airly Castle; some very fine white and green endive, white beet, orange wurtzel (in Fife vulgarly called *Mungo Wilsons*) vegetable marrow, chicory, salsify, and scoronone, were produced by Mr John Dick, Ballyneane, and some very large cabbages by Mr. Radley of the Asylum.

The Mustard Tree of the Gospel, like the moss of Solonon, has given rise to various conjectures. Linnæus thought it was the *Phytolacca asiatica*. Captains Irby and Mangles, and Mr Bankes, great travellers in Egypt and Syria, found a plant which they thought was the mustard tree alluded to.—Mr Don, however has examined specimens of this tree brought home by Mr Bankes, and he finds it to be the *Salvador persica*, *Lin.—Jam. Phil Jour. March, 1827, p. 308.*

Hainault Scythe.—The most laudable exertions continue to be made, in different parts of the country, to introduce this instrument as a substitute for, or adjunct to, the sickle. In East Lothian an Irishman (Toner) has cut half a Scotch acre of wheat in a day, and at the rate of a Scotch acre of oats in eight hours. One peculiar feature of this mode of reaping is, that the lower, or nearer the surface, the crop is cut, so much easier is the work for the reaper. The United East Lothian Agricultural Society have adopted the very judicious mode of giving Toner a premium, on condition of his instructing such reapers as may choose to require his assistance, at the rate of 5s a day. Hopes are entertained that in a few years this style of reaping will become general. The mode of cutting wheat with the sharpening hook, called bagging, and practised in the neighborhood of London, is in effect exactly the same as the mode by the Hainault scythe; but as the operator with the sharpening hook has to stoop very low, it is performed at a greater waste of strength.

Mode of preserving Cabbages during the Winter. When they have arrived at full maturity pull them up with the roots, reverse their crowns, and cover them up, by digging a trench on each side, and laying the earth over them till nothing but the roots are seen above ground. In this situation they will require much less ground, and the exposure of the earth of the ridgelets thus formed will be an excellent winter fallow. Before burying them, of course, all decayed leaves must be removed. In this way I have secured my winter supply for several seasons, and one season most providentially against an inroad of cattle, which in a few nights destroyed the whole winter stock of green vegetables, excepting a few dozen of the cabbages trenced in as above described.—*W. M. Argyleshire, Jan. 23, 1827.*

Pepper.—There are no fewer than 41 kinds of pepper. A Batavian naturalist of the name of Blume has written a description of them, accompanied with plates.

[From the *New York Statesman*.]

AGRICULTURE.

We recently published a correspondence between Isaac J. Ely, Esq. of this city, and Judge Buel, of Albany, relative to the method, and the advantages, of the cultivation of Lucerne. The correspondence threw much light on the subject, and has been extensively re-published, as being highly interesting to the farmer. We are now favored by Mr. Ely, with another communication, which will be found below, from Vanburgh Livingston, Esq. of Westchester county, who has also devoted his attention to that species of grass. It will be seen, that he entirely concurs with Judge Buel. Mr. Livingston is an intelligent and zealous agriculturist; and he is aided in his experiments and efforts for the advancement of rural economy by the enlarged views acquired in foreign travel:

To the Editors of the *Statesman*.

I send you a further communication on the culture of Lucerne. From your agricultural notice of the correspondence between Judge Buel and myself on this subject, I have no doubt Mr. Livingston's interesting letter will find its appropriate place in the *Statesman*. Yours, &c.

Jan. 5th, 1828.

I. M. ELY.

Calendar, (near Yonkers), Westchester County, December 31st, 1827.

DEAR SIR—Your favor of the 20th inst. together with an accompanying copy of the *Statesman*, in which you were so obliging as to send me, I received by this morning's mail.

I have attentively perused the statement of Judge Buel, in his letter to you on the subject of Lucerne, and am pleased to find that his experience in its culture, so fully accords with my own. The first experiment I made with this grass was in the summer of 1823, but the seed did not vegetate, owing, doubtless to their being unsoaked, rather than to any peculiarity of management; for, when sown, they appear to germinate as freely as those of red clover. Not being discouraged by my first essay, I prepared the following year, the same piece of ground for the reception of fresh seed.— This was sown, broadcast, in the early part of July, 1822, without a protecting cover. The plants soon made their appearance, notwithstanding a period of dry weather which succeeded, and continued to grow finely till checked by the frost.— As the crop was neither cut nor depastured, a large burden was left on the ground; and in the ensuing spring, before other grasses had yet started, the Lucerne exhibited a flourishing growth. Without entering into any further details respecting this crop, it will be sufficient to say, that it is completely justified, in all respects, the encomiums I had read upon its value. It may be well, however, to remark that, in accordance with the directions of some writers on the subject, I had the ground harrowed for the alleged purpose of expurgating weeds and promoting its vigor. This was done in the third year of its growth, and by this means more than half of the roots were destroyed. The remainder, however, continued to grow well for a year after; but as the crop did not exhibit the flourishing appearance as before, I determined upon breaking up the ground.

In the beginning of May, 1823, I had about two acres sown with Lucerne. The ground was divided into three pieces, and each piece was along

with the Lucerne, sown with a different grain crop. These consisted of barley, buckwheat, and winter rye. The result of the experiment was as follows, viz. that sown with the rye proved the best, and that with the barley ranked next in quality; but what accompanied the buckwheat was entirely smothered. The Lucerne, growing on the two former pieces, being now in the 4th year of its growth, is in a most vigorous state, and so far from evincing any symptoms of decline, continued to grow, the last season, more luxuriantly than ever. I commenced cutting it, last spring on the 27th of April. It then yielded, I should judge, at the rate of a ton and a half to the acre, on the supposition that the grass had been cured into hay. It was cut for the purpose of soiling, and given to horses in the stable and to working oxen. The produce amounted, during the season, to six cuttings. In this experiment the quantity of seed used was at the rate of 20 lbs. to the acre. It was cultivated on a soil similar to that described by Judge Buel as indispensable to its success.

It is unnecessary, here, to recapitulate all that has been said and written in favour of this plant. I would remark, however, that the great advantages which have been alleged in its favour are fully borne out by my own experience. It may further, be well to observe, that, in referring to the remarks of Judge Buel, there is no difficulty whatever in its being made into hay when managed in the mode he describes. And it seems to me a matter of some importance to bear in mind that, although the virtues of Lucerne have been most largely lauded among by the British writers, it is a plant which is far better adapted to our climate than that of Britain. The latter country, it would appear, does not possess the requisite degree of heat and dryness to ensure the full advantage of its real value. And it seems to be expedient, if not necessary, in that country to cultivate it at the expense of *drilling*, while here it answers with perfect success in the easier and cheaper method of *broad cast*.

Notwithstanding, however, what has been said in praise of the merits of this grass, I am not unaware of the objections that have been made to its general introduction in this country. More especially of those advanced by a distinguished agriculturalist in the vicinity of Philadelphia. It was my intention to have noticed them, and to have offered some views of individual practice in relation to the subject, leading to a difference of conviction. The length, however, to which this communication has already attained, prevents me from dwelling any longer upon the merits in question. With great respect, I am yours &c.

VANBURGH LIVINGSTON.

J. M. Ely, Esq.

From the Gardener's Magazine.

On preparing Ice and filling an Ice-house, so as the Ice may keep for two or three years. By Mr. James Young, gardener to Henry Smith, Esq. of Wilford-house, Nottinghamshire.

SIR.—None of your correspondents having laid before us the proper method of preserving ice, so as to keep in an exposed situation through the hot months of summer, for one, two, or more years, as may be required, I now venture to do so. Most gardeners who are in the habit of laying up ice annually for summer use, complain of its melting away too rapidly. This, I presume, is owing to

the method they practice to preserve it. To remedy this evil, the method which I have practised for a considerable number of years, with gratifying success, is as follows:

In the month of December or January, when the water-pools are frozen to a sufficient thickness, say one or two inches, proceed to break the ice in pieces, and draw it off the water with iron hooks, conveying it to the ice-house in carts, as quick as possible. Before throwing it into the house, three or four men should be employed to break it in small pieces, about the size of common road-metal. Then carry it into the house, where two men should be again employed, in pounding it almost to powder. Lay the bottom and the sides of the house with a layer of wheat straw, three or four inches thick. After there are about two feet of ice thus pounded, take ten pounds of salt, and dissolve in ten gallons of boiling water. When the salt is sufficiently dissolved, pour it on the ice through a common garden watering-pot; thus going on regularly every two feet, watering, and laying the sides with straw till the house is filled, finishing with a double quantity of salt water.— After it has been in eight days, and when it has subsided, fill up closely with small bundles of straw, to exclude all air as far as possible.

An ice-house filled in this manner, will be found, when opened in summer, to be as firm as a rock, and to require at all times the force of a pick-axe to break it up. It will be found to keep three times longer than the common method of filling ice-houses, and is more suitable for being received from the ice-house for use, as it will keep three times longer when exposed to the air. I was induced to try the above method, on account of our ice-house being placed in a very exposed situation. The sun shines from rising to setting on it, and it was found impossible, before adopting this plan, to keep ice above a year, and now it keeps three years, and the last of it is as good as the first. I remain, sir, &c. JAMES YOUNG.

Wilford House, Sept. 5, 1827.

From Cabott's Ride in France.

FRENCH VINEYARDS.

Between Fless and Amiens, near a little village called Aleanois, there is a vineyard, consisting perhaps, of about fifty acres. The vines were growing very low, tied to little sticks, as our *carantions* are tied up in the gardens in England;—and, from all the ideas I had had of vines, before I saw these, I could not conceive at first what sort of vegetables they could be.

FRENCH MODE OF TRAINING PEACH TREES, &c.

I observe, here, [Province of Isle de France], a method of training peach trees, and other wall fruit, which I did not see at Montreuil. Against some of the wall in gentlemen's gardens there are rods, quite straight and round, with the bark left on, and about an inch in diameter. The rods are placed against a wall long-wise, and perpendicular, so as to cross one another, like lattice-work, leaving square spaces of about six or eight inches. Placed in this manner, and fastened together, the rods form a *franc* for the trees, or vines to grow against, and as the branches and shoots must be kept, by means of this frame, from touching the wall, they are perhaps, more healthy than they would be, being fastened to the wall itself instead of these rods.

FRUIT TREES ON THE WAY-SIDE.

From Talmas to Saint Just, a distance of more than twenty leagues, *apple* and *pear trees* have been employed in this capacity, [to line the road-side] for the whole distance, to the exclusion of all others. The fruit of these trees is very insipid. The trees do not seem to have been selected at all for their fruit; indeed most of them appear to have come from seed, without any attention being paid to them on any account but that of their wood. They grow about the fields, as well as along side of the roads; and of the apples, such as they are, a good deal of cider is made.

OAKS—HOW RAISED IN FRANCE.

Oak coppices are made in France by sowing the acorns in the fall of the year, along with wheat or rye, or some other winter crop. The acorns are sowed broad cast, as the grain that is sowed along with them. By the time that the crop of grain comes off the ground, the oaks get to be two or three inches high, and are then allowed to grow into a coppice.

FRENCH MODE OF MAKING WINE.
